VOLUME 14 NUMBER 136

Washington, Saturday, July 16, 1949

TITLE 3—THE PRESIDENT

EXECUTIVE ORDER 10069

AMENDMENT OF EXECUTIVE ORDER NO. 9805,
PRESCRIBING REGULATIONS GOVERNING
PAYMENT OF CERTAIN TRAVEL AND
TRANSPORTATION EXPENSES

By virtue of the authority vested in me by the act of August 2, 1946, 60 Stat. 806, it is ordered that sections 2, 3, and 15 of Executive Order No. 9805 of November 25, 1946, prescribing regulations governing payment of travel and transportation expenses of civilian officers and employees of the United States when transferred from one official station to another for permanent duty, be, and they are hereby, amended to read as follows:

SEC. 2. Travel Expenses of Employees. Travel expenses of the employee transferred shall be allowed in accordance with the Travel Expense Act of 1949 (Public Law 92, approved June 9, 1949) and the Standardized Government Travel Regulations.

SEC. 3. Transportation Expenses of Immediate Family. The transportation of the immediate family of an employee shall be subject to those provisions of the Standardized Government Travel Regulations which relate to transportation, including mileage, and shall be in accordance with section 4 of the Travel Expense Act of 1949, whether the travel originates at the employee's last official station or at some previous place of residence and whether the point of destination is the new official station or some other point selected by him, or both. The cost to the Government shall not exceed the cost of transportation by the most economical route between the last official station and the new official station.

SEC. 15. Advance of Funds. An advance of funds may be allowed employees who are being transferred from one duty station to another within the continental limits of the United States in connection with shipment of their household goods and personal effects. Such advances shall be made under the same safeguards as are required under regulations issued by the Director of the Bureau of the Budget pursuant to authority of the Travel Expense Act of 1949 with respect to advances of funds for travel and shall

This issue is divided into two parts, Part II of which contains a complete reprinting of Title 14, the regulations of the Civil Aeronautics Board and the Civil Aeronautics Administration.

be chargeable to the appropriation of other funds available for the payment of the travel or transportation expenses. In requesting an advance of funds, the applicant shall submit a written statement disclosing the number of rooms containing his personal property which is for shipment, such number of rooms to exclude bathrooms and closets, and reception hallways in apartments. The reported number of rooms shall be multiplied by 1,000, and the result shall be considered the estimated net weight of the prospective shipment. Such statement shall also designate the shipping point and the destination. The estimated weight and the distances between the origin and the destination of the shipment shall be used as the factors required by the schedule of rates to compute the amount of funds which may be advanced in anticipation of the ultimate settlement to be made hereunder.

This order shall be effective as of July 1, 1949.

HARRY S. TRUMAN

THE WHITE HOUSE,

July 14, 1949.

FEDERAL REGISTER

Published daily, except Sundays, Mondays, and days following official Federal holidays, by the Division of the Federal Register, the National Archives, pursuant to the authority contained in the Federal Register Act, approved July 26, 1935 (49 Stat. 500, as amended; 44 U. S. C., ch. 8B), under regulations prescribed by the Administrative Committee, approved by the President. Distribution is made only by the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

The regulatory material appearing herein is keyed to the Code of Federal Regulations, which is published, under 50 titles, pursuant to section 11 of the Federal Register Act, as amended June 19, 1937.

The FEDERAL REGISTER will be furnished by mail to subscribers, free of postage, for \$1.50 per month or \$15.00 per year, payable in advance. The charge for individual copies (minimum 15¢) varies in proportion to the size of the issue. Remit check or money order, made payable to the Superintendent of Documents, directly to the Government Printing Office, Washington 25, D. C.

There are no restrictions on the republication of material appearing in the FEDERAL REGISTER.

Support Program formulated by Commodity Credit Corporation (hereinafter referred to as CCC) and the Production and Marketing Administration (hereinafter referred to as PMA). Loans and purchase agreements will be available in accordance with this bulletin on eligible soybeans produced in 1949. The program will be carried out by PMA under the general supervision and direction of the Manager, CCC.

Sec.	
643.141	Administration.
643.142	Availability of loans and purchase agreements.
643.143	Approved lending agencies.
643.144	Eligible producer.
643.145	Eligible soybeans.
643.146	Approved storage.
643.147	Approved forms.
643.148	Determination of quantity.
643.149	Foreign material.
643.150	Liens.
643.151	Service fees.
643.152	Set-offs.
643.153	Interest rate.
643.154	Transfer of producer's equity.
643.155	Safeguarding of the soybeans.
643.156	Insurance.
643.157	Loss or damage to the soybeans.
643.158	Personal liability.
643.159	Maturity and satisfaction.
643.160	Removal of the soybeans under loan.
643.161	Release of the soybeans under loan.
643.162	Storage allowance and track-loading payment.
643.163	Purchase of notes.
643.164	Basic loan and purchase rate and specifications.
643.165	PMA Commodity Offices.

AUTHORITY: §§ 643.141 to 643.165 issued under sec. 4 (d), Pub. Law 806, 80th Cong.; interpret or apply sec. 5 (a), Pub. Law 806, 80th Cong., secs. 1 (b) and 202 (a), Pub. Law 897, 80th Cong.

§ 643.141 *Administration.* In the field, the program will be administered through State PMA committees, county agricultural conservation committees (hereinafter referred to as county committees) and PMA commodity offices. Forms will be distributed through the offices of State and county committees. County committees will determine or cause to be determined the quantity and grade of the soybeans, the amount of the loan, and the value of the soybeans delivered under a loan or purchase agreement. All loan and purchase documents will be completed and approved by the county committee, which will retain copies of all such documents. The county committee may designate in writing certain employees of the county agricultural conservation association to execute on behalf of the committee any forms and documents in connection with this program.

§ 643.142 *Availability of loans and purchase agreements—(a) Area.* (1) Loans shall be available on eligible soybeans in approved storage in all areas, except that loans on farm-stored soybeans will not be made in any State where the State PMA committee determines that, due to insect infestation or other hazards, farm storage of soybeans is not feasible.

(2) Purchase agreements shall be available on eligible soybeans in all areas.

(b) *Time.* Loans and purchase agreements shall be available through January 31, 1950. Notes and chattel mortgages, note and loan agreements, and purchase agreements, must be signed by the producer and delivered or mailed to the county committee prior to February 1, 1950.

(c) *Source.* Loans and purchase agreements will be made available through the offices of county committees. Disbursements on loans will be made to producers by State PMA offices by means of sight drafts drawn on CCC, or by approved lending agencies under agreement with CCC. Disbursements on loans will be made not later than February 15, 1950, except where specifically approved by CCC in each instance.

§ 643.143 *Approved lending agencies.* An approved lending agency shall be any bank, cooperative marketing association, corporation, partnership, individual, or other legal entity with which CCC has entered into a lending agency agreement (Form PMA-97 or other form prescribed by CCC), or a loan servicing agreement.

§ 643.144 *Eligible producer.* An eligible producer shall be any individual, partnership, association, corporation, or other legal entity producing soybeans in 1949, as landowner, landlord, tenant, or sharecropper.

§ 643.145 *Eligible soybeans.* Eligible soybeans shall be soybeans which meet the following requirements:

(a) The soybeans must have been produced in the continental United States in 1949 by an eligible producer.

(b) The beneficial interest in the soybeans must be in the person tendering the soybeans for a loan or purchase agreement and must have always been in him or must have been in him and a former producer whom he succeeded before the soybeans were harvested.

(c) The soybeans must grade No. 4 or better with respect to factors other than moisture and have a moisture content not in excess of 14%. The soybeans must not grade garlicky, weevily, musty, sour, heating, hot, or have any commercially objectionable odor, or otherwise be of low quality.

(d) If offered as security for a farm storage loan, the soybeans must have been stored in the bin or granary at least 30 days prior to their inspection for measurement, sampling, and sealing, unless otherwise approved by the State PMA committee. There shall be no outstanding warehouse receipts on such soybeans.

§ 643.146 *Approved storage.* Approved storage for soybeans shall meet the following requirements:

(a) Under the loan program, approved farm storage shall consist of storage structures located on or off the farm which, as determined by the county committee, are of such substantial and permanent construction as to afford safe storage of soybeans, permit effective fumigation for the destruction of insects, and afford protection against thieves, rodents, other animals, and weather.

(b) Under the loan and purchase agreement program, approved warehouse storage shall consist of (1) public grain warehouses for which a Uniform Grain Storage Agreement (CCC Form H, revised), in effect for the 1949 crop, has been executed; or (2) warehouses operated by eastern common carriers under tariffs approved by the Interstate Commerce Commission, for which custodian agreements are in effect for the program year. The names of approved warehouses may be obtained from State offices and county committees.

§ 643.147 *Approved forms.* The approved forms consist of the loan and purchase agreement documents which, together with the provisions of this bulletin and any supplements or amendments thereto, govern the rights and responsibilities of the producer. Notes and chattel mortgages, note and loan agreements, and purchase agreements must be dated on or before January 31, 1950, and must have State and documentary revenue stamps affixed thereto where required by law. Loan and purchase agreement documents executed by an administrator, executor or trustee, will be acceptable only where legally valid.

(a) *Farm storage loans.* Approved forms shall consist of producer's note on Commodity Loan Form A, secured by a chattel mortgage on Commodity Loan Form AA.

(b) *Warehouse storage loans.* Approved forms shall consist of the note and loan agreement on Commodity Loan Form B, secured by negotiable warehouse receipts representing the soybeans stored in approved warehouses. All soybeans pledged as security for a loan on a single Commodity Loan Form B must be stored in the same warehouse.

(c) *Purchase agreement documents.* The purchase agreement documents shall consist of the Purchase Agreement (Commodity Purchase Form 1), and Purchase Agreement Settlement (Commodity Purchase Form 4) signed by the producer and approved by the county committee, negotiable warehouse receipts, and such other forms as may be prescribed by CCC.

(d) *Warehouse receipts.* Soybeans in approved warehouse storage under the loan program or delivered under purchase agreements must be represented by warehouse receipts which satisfy the following requirements:

(1) Warehouse receipts must be issued in the name of the producer, must be properly endorsed in blank so as to vest title in the holder, and must be issued by an approved warehouse.

(2) Each warehouse receipt must set forth in its written terms that the soybeans are insured for not less than market value against the hazards of fire, lightning, inherent explosion, windstorm,

cyclone and tornado, or in lieu of this statement, it must have stamped or printed thereon the word "insured."

(3) Each warehouse receipt, or the warehouseman's supplemental certificate (in duplicate) properly identified with the warehouse receipt, must show the gross and net weight or bushels, class, subclass, test weight, grade and foreign material, and such other information as is required to determine the premiums and discounts specified in § 643.164 of this part and by the Uniform Warehouse Receipts Act, and shall be based on the inbound movement on delivery of the soybeans to the warehouse.

§ 643.148 *Determination of quantity.* A bushel will be 60 pounds of soybeans free of foreign material in excess of 3 percent, when determined by weight, or 1.25 cubic feet of soybeans testing 60 pounds per bushel when determined by measurement. A deduction of $\frac{3}{4}$ pound for each sack will be made in determining the net quantity of the soybeans when stored as sacked grain. In determining the quantity of soybeans in farm storage by measurement, fractional pounds of the test weight per bushel will be disregarded, and the quantity determined as above will be the following percentages of the quantity determined for 60-pound soybeans.

For soybean testing	Percent
60 pounds or over.....	100
59 pounds or over, but less than 60.....	98
58 pounds or over, but less than 59.....	97
57 pounds or over, but less than 58.....	95
56 pounds or over, but less than 57.....	93
55 pounds or over, but less than 56.....	92
54 pounds or over, but less than 55.....	90
53 pounds or over, but less than 54.....	88
52 pounds or over, but less than 53.....	87
51 pounds or over, but less than 52.....	85
50 pounds or over, but less than 51.....	83
49 pounds or over, but less than 50.....	82

§ 643.149 *Foreign material—(a) Determination of foreign material.* The percentage of foreign material shall be determined in accordance with the Official Grain Standards of the United States.

(b) *Discount for foreign material.* Foreign material which totals 3 percent or less shall not be deducted from the gross weight of the soybeans. If the total weight of foreign material is in excess of 3 percent, the excess shall be deducted from the total weight of soybeans in the determination of the net number of bushels of soybeans. For purposes of this determination, foreign material shall be computed in tenths of one percent.

§ 643.150 *Liens.* The soybeans must be free and clear of all liens and encumbrances, or if liens or encumbrances exist on the soybeans, proper waivers must be obtained.

§ 643.151 *Service fees—(a) Loans.* Where the soybeans are under a farm storage loan, the producer shall pay a service fee of 1 cent per bushel on the number of bushels placed under loan, or \$3.00, whichever is greater. Where the soybeans are under a warehouse storage loan, the producer shall pay a service fee of $\frac{1}{2}$ cent per bushel on the number of bushels placed under loan, or \$1.50, whichever is greater.

In the case of farm storage loans, state committees are authorized to require prepayment of the \$3.00 service fee.

(b) *Purchase agreements.* At the time the producer signs a purchase agreement he shall pay a service fee of $\frac{1}{2}$ cent per bushel on the number of bushels specified on Commodity Purchase Form 1 as the maximum quantity he may deliver, or \$1.50, whichever is greater.

(c) *Refunds.* No refund of service fees will be made.

§ 643.152 *Set-offs.* Any storage payments due the producer for storage of the commodity in farm storage structures on which CCC has made or guaranteed a storage facility loan to the producer, shall be applied to such storage facility loan until the same is fully repaid. Any amount of such storage payments not so applied and any other storage payments, together with all payments for related services, due the producer shall be subject to set-off in the same manner as provided below for loan or purchase proceeds.

If the producer is indebted to CCC on any accrued obligation, or if any installments past due or maturing within twelve months are unpaid on any loan made available by CCC on farm storage facilities, whether held by CCC or a lending agency, he must designate CCC or such lending agency as the payee of the proceeds of the loan or purchase to the extent of such indebtedness or installments, but not to exceed that portion of the proceeds remaining after deduction of loan service fees and amounts due prior lienholders.

If the producer is indebted to any other agency of the U. S., and such indebtedness is listed on the county debt register, he must designate such agency as the payee of the proceeds as provided above.

Indebtedness owing to CCC or to a lending agency as provided above shall be given first consideration after claims of prior lienholders.

§ 643.153 *Interest rate.* Loans shall bear interest at the rate of 3 percent per annum, and interest shall accrue from the date of disbursement of the loan, notwithstanding the printed provisions of the note.

§ 643.154 *Transfer of producer's equity—(a) Loans.* The right of the producer to transfer either his right to redeem the soybeans under loan or his remaining interest may be restricted by CCC.

(b) *Purchase agreements.* The producer may not assign his interest in the purchase agreement.

§ 643.155 *Safeguarding of the soybeans.* The producer who places farm storage soybeans under loan is obligated to maintain the farm storage structures in good repair, and to keep the soybeans in good condition.

§ 643.156 *Insurance.* CCC will not require the producer to insure the soybeans placed under farm storage loan; however, if the producer does insure such soybeans, such insurance shall inure to the benefit of CCC to the extent of its interest, after first satisfying the pro-

ducer's equity in the soybeans involved in the loss.

§ 643.157 *Loss or damage to the soybeans.* The producer is responsible for any loss in quantity or quality of the soybeans placed under farm storage loan, except that uninsured physical loss or damage occurring without fault, negligence, or conversion on the part of the producer or any other person having control of a storage structure not located on the farm, resulting solely from an external cause other than insect infestation or vermin, will be assumed by CCC, provided, the producer has given the county committee immediate notice in writing of such loss or damage, and provided there has been no fraudulent representation made by the producer in the loan documents or in obtaining the loan.

§ 643.158 *Personal liability.* The making of any fraudulent representations by the producer in the loan documents, or in obtaining the loan, or the conversion or unlawful disposition of any portion of the soybeans by him, shall render the producer subject to criminal prosecution under Federal law and render him personally liable for the amount of the loan and for any resulting expense incurred by any holder of the note.

§ 643.159 *Maturity and satisfaction—(a) Loans.* Loans mature on demand but not later than May 31, 1950. In the case of farm storage loans, the producer is required to pay off his loan on or before maturity, or to deliver the mortgaged soybeans in accordance with instructions of the county committee. Credit will be given at the applicable loan value, according to grade and/or quality, for the total quantity delivered, provided it was stored in the bin(s) in which the soybeans under loan were stored.

If the settlement value of the soybeans delivered under a farm storage loan exceeds the amount due under the loan, the amount of the excess shall be paid to the producer by a sight draft drawn on CCC by the State PMA office.

If the settlement value of the soybeans is less than the amount due on the loan, the amount of the deficiency, plus interest, shall be paid by the producer to CCC, or may be set off against any payment which would otherwise be made to the producer under any agricultural program administered by the Secretary of Agriculture, or any other payments which are due or may become due to the producer from CCC or any other agency of the United States. In the event the farm is sold or there is a change of tenancy, the soybeans may be delivered before the maturity date of the loan, upon prior approval by the county committee.

In the case of warehouse storage loans, if the producer does not repay his loan by maturity, CCC shall have the right to sell or pool the soybeans in satisfaction of the loan in accordance with the provisions of the note and loan agreement and § 643.160. Any payment due a producer at the time of settlement on a warehouse storage loan, shall be made by the appropriate PMA Commodity office.

(b) *Purchase agreements.* The producer who signs a purchase agreement (Commodity Purchase Form 1) will not be obligated to deliver any soybeans to

CCC. However, the quantity stated in the purchase agreement will be the maximum quantity he may deliver to CCC. If the producer who signs a purchase agreement wishes to sell soybeans to CCC, he will have a 30-day period ending May 31, 1950, during which he must notify the county committee of his intention to sell, or on such earlier date as may be prescribed in any amendment or supplement to this bulletin.

In the case of eligible soybeans stored in an approved warehouse, the producer must not later than the day following the final date of such 30-day period, or during such period of time thereafter as may be specified by CCC, submit to the county committee warehouse receipts under which the warehouseman guarantees quality and quantity of the soybeans the producer elects to sell to CCC, but not in excess of the number of bushels shown on Commodity Purchase Form 1. In the case of eligible soybeans stored in other than approved warehouse storage, the county committee will on or after June 1, 1950, issue delivery instructions to the producer. The producer must then complete delivery within a 15-day period immediately following the date the county committee issues delivery instructions, unless the county committee determines that more time is needed for delivery.

Soybeans in other than approved storage will be purchased on delivery at points designated by CCC. When delivery is completed, payment will be made by a sight draft drawn on CCC by the State PMA office on the basis of Commodity Purchase Form 4. The producer shall direct on such form to whom payment of the purchase price shall be made.

Eligible soybeans will be purchased on the basis of the weight, grade, and other quality factors shown on the warehouse receipts and/or accompanying documents; or if such soybeans are delivered to a CCC storage facility, on the basis of the weight, grade, and other quality factors, determined by the county committee (in accordance with instructions for the determination of such factors under the loan program), and agreed to by the producer at the time of delivery.

§ 643.160 Removal of the soybeans under loan. If the loan is not satisfied upon maturity by payment or delivery, the holder of the note may remove the soybeans and sell them, either by separate contract or after pooling them with other lots of soybeans similarly held. If the soybeans are pooled, the producer has no right of redemption after the date the pool is established, but shall share ratably in any over-plus remaining upon liquidation of the pool. CCC shall have the right to treat the pooled soybeans as a reserve supply to be marketed under such sales policies as CCC determines will promote orderly marketing, protect the interests of producers and consumers and not unduly impair the market for the current crop of soybeans, even though part or all of the pooled soybeans are disposed of at prices less than the current domestic price of such soybeans. Any sum due the producer as

a result of the sale of the soybeans or of insurance proceeds thereon, or any ratable share resulting from the liquidation of the pool, shall be payable only to the producer, without a right of assignment by him.

§ 643.161 Release of the soybeans under loan. A producer may at any time obtain release of soybeans remaining under loan by paying to the holder of the note, or note and loan agreement, the principal amount thereof, plus charges and accrued interest. If the note is held by an out-of-town lending agency or by CCC, the producer may request that the note be forwarded to a local lending agency or to the county committee for collection. All charges in connection with the collection of the note shall be paid by the producer. Upon payment of a farm storage loan, the county committee should be requested to release the mortgage by filing an instrument of release or by executing a marginal release on the county records. Partial release of the soybeans prior to maturity may be arranged with the county committee by paying to the holder of the note the amount of the loan, plus charges and accrued interest, represented by the quantity of the soybeans to be released. In the case of warehouse storage loans, such partial release must cover all of the soybeans under one warehouse receipt.

§ 643.162 Storage allowance and track-loading payment. (a) *Warehouse storage loans.* CCC will assume accrued warehouse storage charges on soybeans which are not redeemed by the producer.

(b) *Farm storage loans.* A farm storage payment of 7 cents per bushel will be made to the producer (1) on soybeans delivered to CCC on or after the maturity date, or (2) on soybeans delivered to CCC prior to the maturity date, pursuant to demand by CCC for repayment of the loan. If delivery is made prior to May 31, 1950, upon request by the producer and with the approval of CCC, or in the case of loss assumed by CCC under the loan program, the storage payment will be as follows:

6 cents per bushel if delivered, or loss occurs, in month of May 1950.

5 cents per bushel if delivered, or loss occurs, in month of April 1950.

4 cents per bushel if delivered, or loss occurs, in month of March 1950.

3 cents per bushel if delivered, or loss occurs, in month of February 1950.

2 cents per bushel if delivered, or loss occurs, in month of January 1950.

Earned storage shall be computed as of the date of completion of delivery, or as of the date of a loss assumed by CCC. No storage payment will be made if delivery of soybeans is made, or the loss occurs prior to January 1950.

No storage payment will be made on soybeans delivered to CCC prior to May 31, 1950, pursuant to demand by CCC for the repayment of a loan, if such demand for repayment is due to any fraudulent representation on the part of the producer, or the fact that the soybeans were damaged, threatened with damage, abandoned, or otherwise impaired.

(c) *Purchase agreements.* CCC will assume accrued warehouse charges on

soybeans in approved warehouse storage provided that CCC will not assume any charges in excess of those provided under the Uniform Grain Storage Agreement, CCC Form H, revised, for the 1949 crop, or make a payment of 7 cents per bushel to the producer on soybeans in approved warehouse storage, if it is shown that all warehouse charges other than receiving charges have been paid by the producer through May 31, 1950. A payment of 7 cents per bushel will be made to the producer on soybeans delivered from other than approved warehouse storage pursuant to delivery instructions issued by the county committee.

(d) *Track-loading payment.* A track-loading payment of 2 cents per bushel will be made to the producer on soybeans delivered on track at a country point pursuant to delivery instructions by CCC.

§ 643.163 Purchase of notes. CCC will purchase, from approved lending agencies, notes evidencing approved loans which are secured by chattel mortgages or negotiable warehouse receipts. The purchase price to be paid by CCC will be the principal sum remaining due on such notes, plus accrued interest from the date of disbursement to the date of purchase at the rate of 1½ percent per annum. Lending agencies are required to submit Commodity Credit Corporation Form 500 or such other form as CCC may prescribe, covering all payments received on producer's notes held by them, and are required to remit to CCC an amount equal to 1½ percent per annum of the amount of the principal collected from the date of disbursement to the date of payment. Lending agencies should submit notes and reports to the PMA Commodity office serving the area.

§ 643.164 Basic loan and purchase rate—(a) Basic loan and purchase rate and specifications. The basic loan and purchase rate per net bushel and specifications for eligible soybeans, containing 14% moisture and grading No. 2 or better in accordance with U. S. Grain Standards for soybeans will be announced in a supplement to this bulletin.

(b) *Premiums and discounts.* Premiums and discounts from the basic loan and purchase rate shall be in accordance with the following schedule:

SCHEDULE OF PREMIUMS AND DISCOUNTS FROM BASIC LOAN AND PURCHASE RATE FOR 1949 CROP SOYBEANS

Test weight — discounts		Moisture—premiums	
Pounds	Cents	Percent	Cents
53-----	3½	Below 11.8	6
52-----	1	11.8-11.7 both inclusive	5
51-----	1½	11.8-12.2 both inclusive	4

TITLE 7—AGRICULTURE

Chapter VII—Production and Marketing Administration (Agricultural Adjustment), Department of Agriculture

PART 728—WHEAT

NATIONAL ACREAGE ALLOTMENT FOR 1950 CROP OF WHEAT AND PROCLAMATION PERTAINING TO WHEAT MARKETING QUOTAS FOR 1950-51 MARKETING YEAR

Sec.

728.1 Basis and purpose.

728.2 1950 National acreage allotment for wheat.

728.6 National marketing quota for wheat for 1950-51 marketing year.

AUTHORITY: §§ 728.1 to 728.6 issued under sec. 375, 52 Stat. 66; 7 U. S. C. 1375; apply or interpret secs. 301, 332, 333, 335; 52 Stat. 88, 53, 54, 775, 53 Stat. 1125, 1126; 7 U. S. C. 1301, 1332, 1333, 1335.

§ 728.1 *Basis and purpose.* This document is issued to announce the national

acreage allotment for the 1950 crop of wheat and to proclaim that no national marketing quota with respect to wheat will be in effect for the marketing year beginning July 1, 1950. Section 332 of the Agricultural Adjustment Act of 1938, as amended, provides that the Secretary of Agriculture not later than July 15 of each marketing year for wheat shall ascertain and proclaim the total supply and the normal supply of wheat for such marketing year and the national acreage allotment for the next crop of wheat. Section 333 of the act provides that the national acreage allotment for any crop of wheat shall be that acreage which the Secretary determines will, on the basis of the national average yield for wheat, produce an amount thereof adequate together with the estimated carry-over at the beginning of the marketing year of such crop to make available a supply for such marketing year equal to a normal year's domestic consumption and exports plus 30 percentum thereof. As defined in section 301 (b) of the act, for purposes of this proclamation, "carry-over" of wheat for the 1950-51 marketing year will be the quantity of wheat on hand in the United States at the beginning of such marketing year, not including any wheat which was produced in the United States during the calendar year 1950; "marketing year" for wheat is the period July 1 to June 30; "normal year's domestic consumption" is the yearly average quantity of wheat wherever produced that was consumed in the United States during the ten marketing years, 1939-40 to 1948-49, inclusive, adjusted for current trends in such consumption; "normal year's exports" of wheat is the yearly average quantity of wheat produced in the United States that was exported from the United States during the ten marketing years, 1939-40 to 1948-49, inclusive, adjusted for current trends in such exports; "total supply" of wheat for any marketing year is the carry-over of wheat at the beginning of such marketing year plus the estimated production of wheat in the United States during the calendar year in which the marketing year begins; and "normal supply" is a normal year's domestic consumption and exports, plus 15 percentum thereof.

Section 301 (c) of the act provides that the latest statistics of the Federal Government shall be used in making the determinations required to be made under the act. Section 335 of the act provides that whenever it appears that the total supply of wheat as of the beginning of any marketing year will exceed a normal year's domestic consumption and exports by more than 35 per centum, the Secretary shall proclaim such fact and, during the marketing year beginning July 1, a national marketing quota shall be in effect with respect to the marketing of wheat.

The findings and determinations made by the Secretary in §§ 728.2 and 728.6 have been made on the basis of the latest available statistics of the Federal Government and after due consideration of data, views, and recommendations received within the dates prescribed in public notices (14 F. R. 2203, 3471) of the proposed determinations in accord-

ance with the Administrative Procedure Act (60 Stat. 237).

§ 728.2 *1950 National acreage allotment for wheat.* (a) The "total supply" of wheat for the marketing year beginning July 1, 1949, is 1,490 million bushels;

(b) A "normal year's domestic consumption and exports" is 1,100 million bushels;

(c) The "normal supply" of wheat is 1,265 million bushels;

(d) The national acreage allotment for the 1950 crop of wheat is 63,944,099 acres.

§ 728.6 *National marketing quota for the 1950-51 marketing year.* The total supply of wheat for the 1950-51 marketing year is determined to be 1,445 million bushels. This indicated total supply does not exceed a normal year's domestic consumption and exports by more than 35 percentum. Therefore, no national marketing quota for wheat shall be in effect during the 1950-51 marketing year.

Issued at Washington, D. C., this 14th day of July 1949.

[SEAL] CHARLES F. BRANNAN,
Secretary of Agriculture.

Chapter IX—Production and Marketing Administration (Marketing Agreements and Orders), Department of Agriculture

PART 957—IRISH POTATOES GROWN IN CERTAIN DESIGNATED COUNTIES IN IDAHO AND IN MALHEUR COUNTY, OREGON

LIMITATION OF SHIPMENTS

§ 957.302 *Regulation No. 2—(a) Findings.* (1) Pursuant to Marketing Order No. 57 (7 CFR 957.1 et seq.) regulating the handling of potatoes grown in certain designated counties in Idaho and in Malheur County, Oregon, effective under the applicable provisions of the Agricultural Marketing Agreement Act of 1937, as amended (7 U. S. C. 601 et seq.), and upon the basis of the recommendations and information submitted by the Administrative Committee established under said order, and upon other available information, it is hereby found that the limitation of shipments of such potatoes as hereinafter provided will tend to effectuate the declared policy of the act.

(2) It is hereby further found that it is impracticable and contrary to the public interest to give preliminary notice, engage in public rule-making procedure, and postpone the effective date of this order until 30 days after publication thereof in the FEDERAL REGISTER (5 U. S. C. 1001 et seq.) in that (i) shipments of potatoes from the aforesaid production area begin in mid-July for the current season and such shipments will increase to sizable volume during the latter part of July and continue at seasonally high levels throughout the remainder of the shipping season; (ii) more orderly marketing in the public interest than would otherwise prevail will

be promoted by regulating the shipment of potatoes in the manner set forth below on and after the effective date hereinafter set forth; (iii) compliance with this order will not require any preparation on the part of handlers which cannot be completed by the effective date hereof; and (iv) the time intervening between the date when the committee made the recommendations, also when the information upon which this order is based became available, and the time when this order must become effective in order to effectuate the declared policy of the Agricultural Marketing Agreement Act of 1937, as amended, is insufficient for such compliance.

(b) *Order.* (1) During the period beginning 12:01 a. m., m. s. t., July 18, 1949, and ending 12:01 a. m., m. s. t., September 15, 1949, no handler shall ship potatoes of the Russet Burbank and Long White varieties which are of sizes smaller than 2 inches in diameter or 4 ounces in weight, as such sizes are defined in the U. S. Standards for Potatoes, including the tolerances set forth therein: *Provided*, That, the aforesaid limitation shall not be applicable to potatoes shipped for feed for livestock; *Provided further*, That, nothing contained in this section shall suspend or modify Regulation No. 1 (7 CFR 957.301 et seq.), issued pursuant to § 957.2 (General Cull Regulation), which has been in effect since August 6, 1948, and will continue in effect until suspended or modified pursuant to § 957.2 (b).

(2) The terms used herein shall have the same meaning as when used in Marketing Order No. 57. (48 Stat. 31, as amended; 7 U. S. C. 601 et seq.).

Done at Washington, D. C., this 14th day of July 1949.

[SEAL] S. R. SMITH,
Director, Fruit and Vegetable
Branch, Production and Mar-
keting Administration.

[F. R. Doc. 49-5875; Filed, July 15, 1949;
9:04 a. m.]

PART 958—IRISH POTATOES GROWN IN COLORADO

LIMITATION OF SHIPMENTS

§ 958.301 *Potatoes; limitation of shipments, Colorado—Regulation No. 1—(a) Findings.* (1) Pursuant to Marketing Agreement No. 97 and Order No. 58 (7 CFR 958.1 et seq.) regulating the handling of potatoes grown in Colorado, effective under the applicable provisions of the Agricultural Marketing Agreement Act of 1937, as amended (7 U. S. C. 601 et seq.), and upon the basis of the recommendations and information submitted by the Area Committees and the Colorado Potato Committee established under said order, and upon other available information, it is hereby found that the limitation of shipments of such potatoes as hereinafter provided will tend to effectuate the declared policy of the act.

(2) It is hereby further found that it is impractical and contrary to the public

interest to give preliminary notice, engage in public rule making procedure, and postpone the effective date of this section until 30 days after publication thereof in the FEDERAL REGISTER (5 U. S. C. 1001 et seq.) in that:

(i) Shipments of potatoes from the aforesaid production area have begun for the current season and will reach substantial volume during the last half of July and continue at seasonally high levels throughout the remainder of the shipping season;

(ii) Regulation of shipments of potatoes in the manner set forth below on and after the effective date hereinafter set forth will promote more orderly marketing in the public interest than would otherwise prevail;

(iii) Compliance with this section will not require any preparation on the part of handlers which cannot be completed by the effective date hereof;

(iv) The Area Committees and the Colorado Potato Committee, established pursuant to the Marketing Agreement and Order are prepared to exercise their powers and perform their duties;

(v) Adequate information with respect to the supply and demand for potatoes grown in the production area did not become available to these committees until their meetings held for the purpose of organizing and considering their marketing problems for the 1949 season and such committees did not make their recommendations for regulation until such meetings were held, and, therefore, the recommendations of the committees could not be made available until after the meetings of the committees referred to herein, and;

(vi) Information regarding the marketing policy for the 1949-50 season adopted by the aforesaid committees at each of their meetings has been distributed to handlers and producers of potatoes in the production area.

(b) *Order.* (1) On or after July 18, 1949, and until suspended or modified pursuant to § 958.2 (b) of Order No. 58, no handler shall ship potatoes subject to the provisions of said Order No. 58 regulating the handling of potatoes grown in the State of Colorado which do not meet the requirements of U. S. No. 2 or better grade, as defined in the U. S. Standards for Potatoes (14 F. R. 1955), or amendments thereto, except that a mixture of varieties may be shipped: *Provided*, That no potatoes of the U. S. No. 2 grade or better grades, as defined in said U. S. Standards for Potatoes, which are less than 1½ inches in diameter, may be shipped in addition to the tolerance for undersize as specified for the respective grade in said U. S. Standards for Potatoes.

(2) The terms used in this section shall have the same meaning as when used in Order No. 58 (7 CFR 958.1 et seq.).

(Sec. 5, 49 Stat. 753, as amended; 7 U. S. C. and Sup. 608c)

Done at Washington, D. C., this 13th day of July 1949.

[SEAL] S. R. SMITH,
Director,
Fruit and Vegetable Branch.

[F. R. Doc. 49-5796; Filed, July 14, 1949;
10:42 a. m.]

PART 966—ORANGES GROWN IN CALIFORNIA AND ARIZONA

[Orange Reg. 284]

LIMITATION OF SHIPMENTS

§ 966.430 *Orange Regulation 284—(a) Findings.* (1) Pursuant to the provisions of Order No. 66 (7 CFR, Cum. Supp., 966.1 et seq.) regulating the handling of oranges grown in the State of California or in the State of Arizona, effective under the applicable provisions of the Agricultural Marketing Agreement Act of 1937, as amended, and upon the basis of the recommendation and information submitted by the Orange Administrative Committee, established under the said order, and upon other available information, it is hereby found that the limitation of the quantity of such oranges which may be handled, as hereinafter provided, will tend to effectuate the declared policy of the act.

(2) It is hereby further found that it is impracticable and contrary to the public interest to give preliminary notice, engage in public rule-making procedure, and postpone the effective date of this section until 30 days after publication thereof in the FEDERAL REGISTER (60 Stat. 237; 5 U. S. C. 1946 ed. 1001 et seq.) because the time intervening between the date when information upon which this section is based became available and the time when this section must become effective in order to effectuate the declared policy of the Agricultural Marketing Agreement Act of 1937, as amended, is insufficient, and a reasonable time is permitted, under the circumstances, for preparation for such effective date.

(b) *Order.* (1) The quantity of oranges grown in the State of California or in the State of Arizona which may be handled during the period beginning at 12:01 a. m., P. s. t., July 17, 1949, and ending at 12:01 a. m., P. s. t., July 24, 1949, is hereby fixed as follows:

(i) *Valencia oranges.* (a) Prorate District No. 1: Unlimited movement;

(b) Prorate District No. 2: 1,300 carloads;

(c) Prorate District No. 3: No movement.

(ii) *Oranges other than Valencia oranges.* (a) Prorate District No. 1: No movement;

(b) Prorate District No. 2: No movement;

(c) Prorate District No. 3: No movement.

(2) The prorate base of each handler who has made application therefor, as provided in the said order, is hereby fixed in accordance with the prorate base schedule which is attached hereto and made a part hereof by this reference.

(3) As used herein "handled," "handler," "carloads," and "prorate base" shall have the same meaning as is given to each such term in the said order; and "Prorate District No. 1," "Prorate District No. 2," and "Prorate District No. 3" shall have the same meaning as is given to each such term in § 966.107 (11 F. R. 10258) of the rules and regulations contained in this part.

(48 Stat. 31, as amended; 7 U. S. C. 601 et seq.)

AgencySubchapter C—Federal Savings and Loan
System

[No. 1869]

GENERAL REVISION OF REGULATIONS

JULY 13, 1949.

Resolved that, notice having been duly given (see 14 F. R. 1101) pursuant to § 141.2 (c) of the regulations for the Federal Savings and Loan System (24 CFR 141.2 (c)) of the proposed amend-
ment of Parts 141-149 of the regulations for the Federal Savings and Loan System (24 CFR Parts 141-149), the said regula-
tions are hereby amended, effective August 15, 1949, by deleting therefrom the provisions of Part 149 (24 CFR 149); by renumbering Parts 145-148 thereof (24 CFR 145-148) consecutively as Parts 147-150 thereof (24 CFR Parts 147-150); and by substituting in lieu of Parts 141-144 thereof (24 CFR Parts 141-144), Parts

141-146 (24 CFR Parts 141-146) amended to provide as follows:

PART 141—DEFINITIONS

Sec.	
141.1	Board.
141.2	Federal Association.
141.3	Capital.
141.4	Savings account.
141.5	Short-term savings account.
141.6	Withdrawal value.
141.7	General reserves.
141.8	Surplus.
141.9	Loans on the security of first liens.
141.10	Home.
141.11	Combination of home and business property.
141.12	Other improved real estate.
141.13	Improved real estate.
141.14	Installment loan.
141.15	Insured loan.
141.16	Guaranteed loan.

AUTHORITY: §§ 141.1 to 141.16 issued under secs. 4 (a), 5 (a), 48 Stat. 129, 132; 12 U. S. C. 1463 (a), 1464 (a); Reorg. Plan No. 3 of 1947, 12 F. R. 4981, 3 CFR, 1947 Supp.

§ 141.1 *Board.* The term "Board" means the Home Loan Bank Board or one or more of its officials who has been duly authorized by the Home Loan Bank Board to act in its behalf.

§ 141.2 *Federal Association.* The term "Federal association" means a Federal savings and loan association chartered by the Board as provided in section 5 of the Home Owners' Loan Act of 1933, as amended.

§ 141.3 *Capital.* The term "capital" means the aggregate of the payments on savings accounts in a Federal association, plus earnings credited thereto, less lawful deductions therefrom.

§ 141.4 *Savings account.* The term "savings account" means the monetary interest of the holder thereof in the capital of a Federal association and consists of the withdrawal value of such interest.

§ 141.5 *Short-term savings account.* The term "short-term savings account" means a savings account in a Federal association which is to be withdrawn in less than twenty-four months from the date on which such account is opened, or a savings account in a Federal association established for the purpose of accumulating funds to pay taxes or insurance premiums, or both, in connection with a loan on the security of a lien on real estate.

§ 141.6 *Withdrawal value.* The term "withdrawal value" means the amount paid on a savings account in a Federal association, plus earnings credited thereto, less lawful deductions therefrom.

§ 141.7 *General reserves.* The term "general reserves" means the aggregate amount of reserves of a Federal association established by such association for the sole purpose of meeting losses.

§ 141.8 *Surplus.* The term "surplus" means the undistributed earnings of a Federal association which are held as unallocated reserves for general corporate use.

§ 141.9 *Loans on the security of first liens.* The term "loans on the security of first liens" means loans on the security of any instrument (whether a mortgage, deed of trust, or land contract) which

makes the interest in the real estate described therein (whether in fee or in a leasehold extending or renewable automatically for a period of at least 50 years) specific security for the payment of the obligation secured by such instrument, provided the instrument is of such nature that, in the event of default, the real estate described in such instrument could be subjected to the satisfaction of such obligation with the same priority as a first mortgage or a first deed of trust in the jurisdiction where the real estate is located.

§ 141.10 *Home.* The term "home" means real estate upon which there is located a dwelling or dwellings for not more than four families.

§ 141.11 *Combination of home and business property.* The term "combination of home and business property" means real property which is used in part for business purposes and in part for residence purposes for not more than four families, provided the use as a residence is of a bona fide character.

§ 141.12 *Other improved real estate.* The term "other improved real estate" means real estate other than a home or combination home and business property which, because of its state of improvement, produces sufficient income to maintain the property and retire the loan in accordance with the terms thereof.

§ 141.13 *Improved real estate.* The term "improved real estate" means real estate which is, or which from the proceeds of the loan will become, a home, combination of home and business property, or other improved real estate.

§ 141.14 *Installment loan.* The term "installment loan" means any loan repayable in regular periodic payments, equal or unequal, sufficient to retire the debt, interest and principal, within the contract period: *Provided, however,* That the loan contract shall not require any subsequent periodic principal payment to be greater than any previous periodic principal payment.

§ 141.15 *Insured loan.* The term "insured loan" means a loan that is insured, or as to which the mortgagee is insured, or as to which a commitment for any such insurance has been made under the provisions of either the National Housing Act or the Servicemen's Readjustment Act of 1944, as now or hereafter amended.

§ 141.16 *Guaranteed loan.* The term "guaranteed loan" means a loan that is guaranteed or as to which a commitment to guarantee has been made under the provisions of the Servicemen's Readjustment Act of 1944, as now or hereafter amended.

PART 142—RULES AND REGULATIONS: HEARINGS

§ 142.1 *Amendment of rules and regulations.* The rules and regulations in this subchapter, subject to any specific provisions contained herein, may be amended in whole or in part at any time in accordance with the provisions set forth in Subchapter A of this chapter.

(Secs. 4 (a), 5 (a), 48 Stat. 129, 132; 12 U. S. C. 1463 (a), 1464 (a); Reorg. Plan No. 3 of 1947, 12 F. R. 4981, 3 CFR, 1947 Supp.)

§ 142.2 *Hearings.* Any person who has made an application or petition to the Board pursuant to any provision of Parts 143, 144, 145, or 146 of this subchapter may request a hearing thereon, provided such application or petition has been denied or disapproved by the Board. At any time after the filing of any such application or petition and before consideration thereof by the Board, any interested person may request a hearing upon such application or petition. The Board may order a hearing in connection with the consideration of any matter arising under any provision of the rules and regulations in this subchapter, whether or not any request therefor has been made by any person. The Board may deny any request for, or dispense with, any hearing for which this section provides when, in its judgment, no need therefor exists. All hearings held pursuant to the provisions of this section and all procedure in connection therewith shall be in accordance with the provisions set forth in Subchapter A of this chapter.

(Secs. 4 (a), 5 (a), 48 Stat. 129, 132; 12 U. S. C. 1463 (a), 1464 (a); Reorg. Plan No. 3 of 1947, 12 F. R. 4981, 3 CFR, 1947 Supp.)

PART 143—INCORPORATION, ORGANIZATION, AND CONVERSION

Sec.	
143.1	Corporate title.
ORGANIZATION	
143.2	Application for permission to organize.
143.3	Subscription to capital.
143.4	Petition for charter.
143.5	Issuance of charter.
143.6	Completion of organization.
143.7	Limitations on transaction of business.
CONVERSION	
143.8	Eligibility.
143.9	Preliminary application.
143.10	Approval by members.
143.11	Formal application.
143.12	Organization after conversion.

AUTHORITY: §§ 143.1 to 143.12 issued under secs. 4 (a), 5 (a), 48 Stat. 129, 132; 12 U. S. C. 1463 (a), 1464 (a); Reorg. Plan No. 3 of 1947, 12 F. R. 4981, 3 CFR, 1947 Supp.

§ 143.1 *Corporate title.* The full corporate title of each Federal association shall include the words "Federal Savings and Loan Association", which shall be preceded by a suitable descriptive word and may be followed by the words "of _____", using the name of the place in which such association is organized or at which its home office is located: *Provided,* That the name of the place, if used, shall not include the name of the State: *And provided further,* That the Board shall have the right to change the name requested if, in the Board's judgment, such name is inappropriate or is not suitable.

ORGANIZATION

§ 143.2 *Application for permission to organize—(a) Form.* Persons who desire to organize a Federal association

shall first execute in triplicate an application, in form prescribed by the Board, for permission to organize such an association before taking any other action in connection therewith. (The Board has prescribed a form of Application for Permission to Organize; copies may be obtained from the Home Loan Bank Board, Washington, D. C.; or from any Federal home loan bank.)

(b) *Filing.* Upon execution of an application for permission to organize by 5 responsible citizens (hereinafter referred to as the "applicants") the original and two copies thereof shall be submitted to the Board through the Federal home loan bank of the district in which it is intended to organize such association. The applicants shall submit with their application statements, exhibits, maps, and other data, together with an affidavit that the representations made thereby are consistent with the facts to the best of the applicants' information and belief, which data shall be sufficiently detailed and comprehensive to enable the Board to pass upon the application as to (1) the character and responsibility of the applicants; (2) the necessity for such Federal association in the community to be served; (3) reasonable probability of its usefulness and success; and (4) whether or not such Federal association can be established without undue injury to properly conducted existing local thrift and home-financing institutions.

(c) *Hearing.* If the Board does not deny the application on the basis of the data submitted by the applicants and any other information in its possession without a hearing, it will set a date on which a hearing may be held and the applicants will be directed to have published at least 20 days before such date in a newspaper printed in the English language of general circulation in the county in which the proposed Federal association will have its office, a notice in the following form, unless another form is prescribed by the Board:

Notice is hereby given that the applicants listed below have applied to the Home Loan Bank Board for permission to organize a Federal association to be located in

(City) (State)
A hearing will be held on the application at _____ o'clock in the _____ noon on _____, 19____, in Room 827, Federal Home Loan Bank Board Building, Washington, D. C., if written notice of intention to appear in person or by attorney to protest the application is received by the Home Loan Bank Board from one or more persons at least 10 days before that date. If no such notice has been received by the Home Loan Bank Board at least 10 days before said date, the hearing will be dispensed with unless otherwise ordered by the said Board.

The applicants shall file with the Board at least 10 days before the date set for the hearing an affidavit of publication of the notice giving the date of publication and the name of the newspaper in which it was published. The applicants shall also promptly, after receipt of a copy of the resolution providing for the hearing, cause a copy of the notice to be mailed to the state supervisor of institutions of a similar type of the state in which the proposed Federal association will be located. If at least 10 days before

the date set for the hearing the Board has received no written statements of intention to appear in person or by attorney to protest the application from one or more parties, the hearing will be dispensed with unless otherwise ordered by the Board. The Board will notify the applicants at least 5 days before the date of the hearing whether or not a hearing will be held. Notwithstanding any other provisions of this subchapter, the Board may at any time dispense with any hearing on an application for permission to organize a Federal association.

(d) *Approval.* If the Board approves the application it will establish, as conditions to be met prior to the issuance of a charter, requirements as to (1) minimum number of subscribers to the association's capital; (2) minimum amount of capital to be paid into the association's savings accounts upon issuance of a charter to it; (3) guarantee by the organizers or others of the association's organization and operating expenses; and (4) such other requirements as it deems necessary or desirable. Approval of an application for permission to organize a Federal association will not in any manner obligate the Board to issue a charter.

§ 143.3 *Subscription to capital.* Upon approval by the Board of an application for permission to organize a Federal association, the applicants shall constitute the organization committee and shall perfect a temporary organization by electing a chairman, vice-chairman, and a secretary, who shall act as the temporary officers of such association until their successors are duly elected and qualified. Such temporary officers may thereupon proceed to effect compliance with any conditions prescribed by the Board, including the securing of subscriptions to such Federal association's capital in the following form (hereinafter referred to as "subscription to capital"):

(City) (State)
(Date)

HOME LOAN BANK BOARD,
Washington, D. C.

Having been given permission to organize a Federal association, the undersigned hereby subscribe for the amount of capital indicated below, and contract to pay into a savings account, upon the issuance of a charter, the amount of cash stated opposite their respective names below. We agree to cooperate in the development of such an association for the promotion of local savings and home-financing.

(Name) (Address)
(Amount of capital to be paid in cash upon issuance of charter)

§ 143.4 *Petition for charter—(a) Form.* When the required minimum number of persons shall have subscribed for the required minimum amount of capital and shall have agreed to pay such amount in cash upon issuance of a charter by the Board, and when any other conditions prescribed by the Board

shall have been met, a petition addressed to the Board shall be signed by the temporary officers, as provided in § 143.3, requesting the Board to issue a charter under a name chosen by the petitioners or such other name as the Board may deem appropriate. Such petition for charter shall state that (1) the applicants have complied in all respects with the Home Owners' Loan Act of 1933, as amended, and with the rules and regulations governing the organization of a Federal association; (2) the applicants have incurred no expense in connection with the formation of such association which is chargeable to it and that no such expenses will be incurred; (3) no money will be collected on account of such association prior to issuance of a charter to it by the Board; (4) an organization committee has been created (naming such committee and the officers thereof); and (5) the organization committee will organize such association upon the issuance of a charter by the Board and will serve as temporary officers of such association until officers thereof are elected by such association's board of directors as provided in § 143.6.

(b) *Filing.* The petition for charter, together with evidence of compliance with the conditions prescribed by the Board in approving the application for permission to organize, including the original and a duplicate copy of subscriptions to capital, shall be promptly submitted in duplicate to the Board through the Federal home loan bank of the district in which such association is to be located.

§ 143.5 *Issuance of charter.* The Board will take action issuing or denying a charter after receipt of evidence as to compliance by the applicants with the conditions prescribed by the Board. The action of the Board shall be final. If a petition for charter is approved by the Board a charter will be issued in the form of Charter N as provided in § 144.1 of this subchapter.

§ 143.6 *Completion of organization—(a) Organization meeting.* Promptly upon receipt of a charter for a Federal association, the temporary officers thereof shall call a meeting of the subscribers to such association's capital; the notice of such meeting shall be mailed to each such subscriber at least 5 days prior to the date of such meeting. Subscribers who have subscribed for a majority of such Federal association's capital, present in person or by proxy, shall constitute a quorum for the transaction of business. At such organization meeting directors of such Federal association shall be elected according to the provisions of the association's charter and bylaws, and such other action may be taken by such subscribers as is permitted by such charter and bylaws; any action taken at any such meeting under such charter and bylaws shall be deemed an acceptance by such Federal association of its charter, and of the bylaws, which shall be in the form provided in § 144.6 of this subchapter.

(b) *First meeting of directors.* Immediately after election, as hereinabove provided, the board of directors of such Federal association shall hold its first

meeting and shall at that time elect officers of the association as prescribed by its charter and bylaws and shall take such other action as may be necessary to permit such association to be operated in accordance with section 5 of the Home Owners' Loan Act of 1933, as amended, the association's charter and bylaws, and these rules and regulations. When such officers have been bonded as provided in § 145.12 of this subchapter, they shall forthwith collect the sums due on subscriptions to such Federal association's capital.

(c) *Membership in Federal home loan bank.* Upon issuance of a charter to a Federal association it shall promptly qualify as a member of a Federal home loan bank.

(d) *Insurance of accounts.* Upon the issuance of a charter to a Federal association it shall promptly meet all requirements necessary to obtain insurance of its accounts by the Federal Savings and Loan Insurance Corporation.

(e) *Failure to complete.* The organization of a Federal association is not completed until the organization meeting of subscribers to its capital and the first meeting of its directors have been held, as hereinabove provided, and the permanent officers have been bonded and such association is in possession of the minimum amount of cash required to be paid in on subscriptions to its capital: *Provided*, That the Board may specify additional requirements before organization shall be deemed to have been completed. In the event that the organization of a Federal association is not so completed within a period of six months after the issuance of its charter, such charter shall become void and all amounts collected by such association on subscriptions to its capital shall thereupon be returned to the respective subscribers to such capital or to their assigns.

§ 143.7 *Limitations on transaction of business.* No person shall proceed to organize a Federal association or to collect any money from others for such purpose, or represent himself as authorized so to do, and no Federal association shall transact any business prior to the completion of the organization thereof, except as herein provided.

CONVERSION

§ 143.8 *Eligibility.* Any member of a Federal home loan bank may convert itself into a Federal association upon such terms and conditions as the Board may prescribe and upon a vote of not less than 51 percent of the votes cast at a legal meeting called to consider such action: *Provided*, That such member shall comply with all laws, if any, of its jurisdiction which expressly provide for conversion into a Federal association, and with the rules and regulations in this subchapter.

§ 143.9 *Preliminary application—(a) Form.* Any member of a Federal home loan bank that desires to convert into a Federal association, hereinafter referred to as "applicant," may, after approval by its board of directors, file its preliminary application for conversion in form prescribed by the Board; any institution which is not a member of a Federal home

loan bank but which is eligible to apply for such membership may likewise file simultaneously its application for such membership and its preliminary application for conversion. (The Board has prescribed a form of "Preliminary Application for Conversion into a Federal Association," copies of which may be obtained from the Home Loan Bank Board, Washington, D. C., or from any Federal home loan bank.)

(b) *Filing.* A preliminary application for conversion into a Federal association shall be filed in duplicate with the Board through the Federal home loan bank of which the applicant is or proposes to become a member. The applicant shall submit such financial statements and such other information as the Board may require and shall pay all costs, as determined by the Board, arising out of the Board's consideration of the application; the applicant shall also submit with its preliminary application a statement showing the plan of conversion, which shall expressly provide for (1) appropriate reserves and surplus for the Federal association; (2) satisfaction in full or assumption by the Federal association of all creditor obligations of the applicant; (3) issuance by the Federal association of its savings accounts to the holders of withdrawable accounts of the applicant in an amount equivalent to the value of their accounts, including the present value of any preferences to which any of such holders are entitled; and (4) issuance by the Federal association of its savings accounts to all holders of guarantee, permanent, reserve fund, or other nonwithdrawable capital stock of the applicant in an amount equivalent to the value of such stock.

(c) *Board action.* The Board will consider the preliminary application for conversion, together with such information and reports of examination, audit, and appraisal as may have been submitted to or required by the Board, and will either approve or disapprove such application; approval may be conditional.

§ 143.10 *Approval by members.* Upon approval by the Board of a preliminary application for conversion into a Federal association the applicant shall proceed promptly to comply with all conditions prescribed in such approval and to obtain the vote of its members required by the laws of the jurisdiction to which the applicant is subject, if any, which expressly provide for conversion into a Federal association, and in any event to obtain the vote required by section 5 (f) of the Home Owners' Loan Act of 1933, as amended, in favor of the plan of conversion as approved by the Board, and to comply with all other necessary legal formalities; the Board reserves the right to cancel its approval of a preliminary application for conversion into a Federal association in the event an applicant fails to obtain promptly the approval of its members as provided in this section.

§ 143.11 *Formal application—(a) Form.* Upon approval by its members of the plan of conversion, as provided in § 143.10, the applicant may file its formal application for conversion into a Federal association in form prescribed by the Board. (The Board has prescribed a

form of "Application for Conversion into a Federal Association", copies of which may be obtained from the Home Loan Bank Board, Washington, D. C., or from any Federal home loan bank.)

(b) *Filing.* The formal application for conversion into a Federal association shall be filed in duplicate with the Board through the Federal home loan bank of which the applicant is or proposes to become a member; such application shall be accompanied by evidence satisfactory to the Board showing compliance by the applicant with all conditions prescribed by the Board in its approval of the preliminary application for conversion into a Federal association and, unless the applicant is insured by the Federal Savings and Loan Insurance Corporation, by formal application for insurance of accounts.

(c) *Issuance of charter.* No formal application for conversion into a Federal association will be approved by the Board unless the applicant shall have been approved for membership in a Federal home loan bank. Upon approval by the Board of a formal application for conversion into a Federal association, the Board will issue a Charter N to such association, as provided in § 144.1 of this subchapter; conversion into a Federal association is completed upon the issuance of such charter and upon compliance with all relevant requirements of law, if any, which expressly provide for such conversion.

§ 143.12 *Organization after conversion.* Upon issuance of a Federal charter, as provided in § 143.11, a legal meeting of the members of such Federal association shall be held promptly, after due notice unless held upon a valid adjournment of a previous legal meeting. At such meeting directors shall be elected and such other action shall be taken as is necessary fully to carry into effect the conversion as approved by the Board and to operate such Federal association in accordance with the law and the rules and regulations in this subchapter. Immediately thereafter the board of directors shall meet, elect officers, and transact such other business as may be necessary and proper. Such association shall not represent itself as a Federal association until the meetings have been held and the required actions taken as herein provided.

AUTHORITY: §§ 144.1 to 144.7 issued under secs. 4 (a), 5 (a), 48 Stat. 129, 132; 12 U. S. C. 1463 (a), 1464 (a); Reorg. Plan No. 3 of 1947, 12 F. R. 4981, 3 CFR, 1947 Supp.

CHARTER

§ 144.1 *Issuance of Charter N.* Except as provided in § 144.2, the following

form of charter, which shall be known as Charter N, will be issued on and after the effective date of the rules and regulations in this subchapter, upon approval by the Board of any petition for a charter for a Federal association pursuant to the provisions of subsections (a) or (i) of section 5 of the Home Owners' Loan Act of 1938, as amended:

CHARTER N

1. *Corporate title.* The full corporate title of the Federal association hereby chartered is _____ Federal Savings and Loan Association _____

2. *Office.* The home office shall be located at _____, in the County of _____, State of _____

3. *Objects and powers.* The objects of the association are to promote thrift by providing a convenient and safe method for people to save and invest money and to provide for the sound and economical financing of homes; and, in the accomplishment of such objects, it shall have perpetual succession and power: (1) To act as fiscal agent of the United States when designated for that purpose by the Secretary of the Treasury, under such regulations as he may prescribe, and shall perform all such reasonable duties as fiscal agent of the United States as he may require and to act as agent for any other instrumentality of the United States when designated for that purpose by any such instrumentality; (2) To sue and be sued, complain and defend in any court of law or equity; (3) To have a corporate seal, affixed by imprint, facsimile or otherwise; (4) To appoint officers and agents as its business shall require, and allow them suitable compensation; (5) To adopt bylaws not inconsistent with the Constitution or laws of the United States and rules and regulations adopted thereunder and this charter; (6) To raise its capital, which shall be unlimited, by accepting payments on savings accounts representing share interests in the association; (7) To borrow money; (8) To lend and otherwise invest its funds; (9) To wind up and dissolve, merge, consolidate, convert, or reorganize; (10) To purchase, hold, and convey real and personal estate consistent with its objects, purposes, and powers; (11) To mortgage or lease any real and personal estate and take such property by gift, devise, or bequest; and (12) To exercise all powers conferred by law. In addition to the foregoing powers expressly enumerated, this association shall have power to do all things reasonably incident to the accomplishment of its express objects and the performance of its express powers. It shall exercise its powers in conformity with all laws of the United States as they now are, or as they may hereafter be amended, and with all rules and regulations which are not in conflict with this charter now or hereafter made thereunder.

4. *Members.* All holders of the association's savings accounts and all borrowers therefrom are members. In the consideration of all questions requiring action by the members of the association, each holder of a savings account shall be permitted to cast one vote for each \$100, or fraction thereof, of the withdrawal value of his account. A borrowing member shall be permitted, as a borrower, to cast one vote, and to cast the number of votes to which he may be entitled as the holder of a savings account. No member, however, shall cast more than 50 votes. Voting may be by proxy. Any number of members present at a regular or special meeting of the members shall constitute a quorum. A majority of all votes cast at any meeting of members shall determine any question. The members who shall be entitled to vote at any meeting of the members shall be those owning savings accounts and borrowing members of record on the books of the association at the end of the

calendar month next preceding the date of after the date specified as the redemption such meeting. The number of votes which each member shall be entitled to cast at any meeting of the members shall be determined from the books of the association as of the end of the calendar month next preceding the date of such meeting. Those who were members at the end of the calendar month next preceding the date of a meeting of members but who shall have ceased to be members prior to such meeting shall not be entitled to vote thereat. All savings accounts shall be nonassessable.

5. *Directors.* The association shall be under the direction of a board of directors of not less than 5 nor more than 15, as fixed in the association's bylaws or, in the absence of any such bylaw provision, as from time to time expressly determined by resolution of the association's members. Each director of the association shall be a member of the association, and a director shall cease to be a director when he ceases to be a member. Directors of the association shall be elected by its members by ballot: *Provided*, That in the event of a vacancy in the directorate, including vacancies created by an increase in the number of directors, the board of directors may fill such vacancy, if the members of the association fail so to do, by electing a director to serve until the next annual meeting of the members. Directors shall be elected for periods of 3 years and until their successors are elected and qualified, but provision shall be made for the election of approximately one-third of the board of directors each year.

6. *Withdrawals.* The association shall have the right to pay the withdrawal value of its savings accounts at any time upon application therefor and to pay the holders thereof the withdrawal value thereof. Upon receipt of a written request from any holder of a savings account of the association for the withdrawal from such account of all or any part of the withdrawal value thereof, the association shall within 30 days pay the amount requested; *Provided*, that if the association is unable to pay all withdrawals requested at the end of 30 days from the date of such requests, it shall then pay all withdrawals requested in accordance with such methods and procedures as to amounts and allotments of funds for such purposes as shall be provided in regulations made by the Home Loan Bank Board in effect at the date of the request for withdrawal. Holders of savings accounts for which application for withdrawal has been made shall remain holders of savings accounts until paid and shall not become creditors.

7. *Redemption.* At any time sufficient funds are on hand, the association shall have the right to redeem, by lot or otherwise as the board of directors may determine, all or any part of any of its savings accounts on June 30 or December 31, by giving 30 days' notice of such redemption by registered mail addressed to the holder of each such savings account at his last address as recorded on the books of the association. The association may not redeem any of its savings accounts when there is an impairment of its capital or when it has any request for withdrawal which has been on file and unpaid for more than 30 days. The redemption price of each savings account redeemed shall be the full value thereof, as determined by the board of directors, but in no event shall the redemption price be less than the withdrawal amount of such savings account. If a savings account which is redeemed is entitled to participate in any reserve for bonus, the amount in such reserve for bonus which is properly allocable to such savings account shall be paid as part of the redemption price thereof. If any notice of redemption shall have been duly given, and if the funds necessary for such redemption shall have been

set aside so as to be and to continue to be available for that purpose, earnings upon such account shall cease to accrue from and date and all rights with respect to each such account shall forthwith, after such redemption date, terminate, except only the right of the holder of record of such savings account to receive the redemption price thereof without earnings.

8. *Loans and investments.* The association may make any loan or investment authorized by statute and the rules and regulations made by the Home Loan Bank Board and in effect on August 15, 1949; it may make such additional loans and investments as may thereafter be authorized by amendments of the said rules and regulations.

9. *Power to borrow.* The association may borrow money in an aggregate amount not exceeding one-half of its capital; the amount which may be borrowed from sources other than a Federal home loan bank shall not exceed one-tenth of such capital. Notwithstanding the foregoing limitations, the association may, with prior approval by the Home Loan Bank Board, borrow from a Federal home loan bank or from any Federal agency or instrumentality without limitation, upon such terms and conditions as may be required by such bank or agency. The association may pledge and otherwise encumber any of its assets to secure its debts.

10. *Reserves, surplus, and distribution of earnings.* The association shall maintain general reserves for the sole purpose of meeting losses; such reserves shall include the reserve required for insurance of accounts. Any losses may be charged against general reserves. If and whenever the general reserves of the association are not equal to at least 10 percent of its capital, it shall, as of June 30 and December 31 of each year, credit to such reserves an amount equivalent to at least 5 percent of its net earnings for the 6 months' period, or such amount as may be required by the Federal Savings and Loan Insurance Corporation, whichever is greater, until such reserves are equal to at least 10 percent of the association's capital. As of June 30 and December 31 of each year, after payment or provision for payment of all expenses, credits to general reserves and such credits to surplus as the board of directors may determine, and provision for bonus on savings accounts as authorized by regulations made by the Home Loan Bank Board, the board of directors of the association shall cause the remainder of the net earnings of the association for the 6 months' period to be distributed promptly on its savings accounts, ratably, as declared by the board of directors, to the withdrawal value thereof; in lieu of or in addition to such net earnings, any of the association's surplus funds may be likewise distributed. Such net earnings shall be credited to savings accounts or paid, as directed by the owner. All holders of savings accounts shall participate at the same rate and on the same basis in the distribution of earnings: *Provided*, That the association is not required to distribute earnings on short-term savings accounts or on accounts of \$10 or less. Except as provided above, earnings shall be declared on all savings accounts of record at the close of each such 6 months' period, on the withdrawal value of each such account at the beginning of the said 6 months' period, plus the payments made thereon during such period (less amounts withdrawn, and, for purposes of participation in earnings, deducted from the latest previous payments), computed at the declared rate for the time invested, determined as provided below. The date of investment shall be the date of actual receipt of such payments by the association, unless the board of directors fixes a date, not later than the tenth of the month, for determining the date of investment of payments on savings accounts or designated classes thereof. Payments, affected by such determination date, received by the association

on or before such determination date, shall receive earnings as if invested on the first of such month. Payments, affected by such determination date, received subsequent to such determination date, shall receive earnings as if invested on the first of the next succeeding month.

11. *Amendment of charter.* No amendment, addition, alteration, change, or repeal of this charter shall be made unless such proposal is made by the board of directors of the association, and submitted to and approved by the Home Loan Bank Board, and is thereafter submitted to and approved by the members at a legal meeting. Any amendment, addition, alteration, change, or repeal so acted upon and approved shall be effective, if filed with and approved by the Home Loan Bank Board, as of the date of the final approval of, or as fixed by, the members.

HOME LOAN BANK BOARD,
By _____
(Chairman)

Attest:

(Secretary)

§ 144.2 *Pending applications.* All pertinent provisions of Part 142 of this subchapter in effect prior to the effective date hereof shall remain in full force and effect as to any formal applications made prior to such date for permission to organize a Federal association under the provisions of section 5 (a), or to convert to a Federal association under the provisions of section 5 (1), of the Home Owners' Loan Act of 1933, as amended.

§ 144.3 *Adoption of Charter N.* A Federal association that has a Charter E or a Charter K may amend such charter in its entirety to read in the form of Charter N, by majority vote of such association's members present at any duly called regular or special meeting of members: *Provided,* That, in the case of a Federal association that has a Charter K, the board of directors of such association shall first have proposed such amendment, and the provisions of this section shall be deemed to be the approval by the Board of such proposal. Upon receipt of the following petition from a Federal association that has amended its charter as provided in this section, the Board will issue to such Federal association a Charter N in the same name and showing the same location of home office as is prescribed in such association's present charter, unless the Board when petitioned approves a change in such name or location:

HOME LOAN BANK BOARD,
Washington, D. C.

The undersigned, pursuant to § 144.3 of the Rules and Regulations for the Federal Savings and Loan System, respectfully petitions the Board to issue an amended charter in the form of Charter N to the undersigned, fixing the name and home office of the undersigned which its present charter prescribes.

The undersigned, by its secretary, hereby certifies that the members at a meeting duly called and held adopted the following resolution:

"Be it resolved, That the present charter of this association be amended to read in the form of Charter N as set forth in Section 144.1 of the Rules and Regulations for the Federal Savings and Loan System, prescribing the present name and home office fixed by the present charter of this association."

In witness whereof, the Secretary of the undersigned has hereunto affixed his hand

and the seal of the undersigned this _____ day of _____, 19____.

FEDERAL SAVINGS AND
LOAN ASSOCIATION
[CORPORATE
SEAL] By _____

§ 144.4 *Evidence of corporate existence.* The issuance of a charter to a Federal association shall constitute the incorporation of such Federal association by the Board; the charter of a Federal association, or a certified copy thereof under the seal of the Board, shall be evidence of the corporate existence of such Federal association.

BYLAWS

§ 144.5 *Prescribed form.* A Federal association that has a Charter N shall operate under the following prescribed bylaws, unless and until such bylaws are amended in accordance with the procedure therein set forth:

1. *Annual meetings of members.* The annual meeting of the members of the association for the election of directors and for the transaction of any other business of the association shall be held at its home office at 2 o'clock in the afternoon on the third Wednesday in January of each year, if not a legal holiday, or if a legal holiday then on the next succeeding day not a legal holiday. The annual meeting may be held at such other time on such day or at such other place in the same community as the board of directors may determine. At each annual meeting, the officers shall make a full report of the financial condition of the association and of its progress for the preceding year, and shall outline a program for the succeeding year. Annual meetings of the members shall be conducted in accordance with Roberts' Rules of Order.

2. *Special meetings of members.* Special meetings of the members of the association may be called at any time by the president or the board of directors, and shall be called by the president, a vice president, or the secretary upon the written request of members holding of record in the aggregate at least one-tenth of the capital of the association. Such written request shall state the purposes of the meeting and shall be delivered at the home office of the association addressed to the president. Special meetings of the members shall be conducted in accordance with Roberts' Rules of Order.

3. *Notice of meeting of members.* (a) Notice of each annual meeting shall be either published once a week for the two successive calendar weeks (in each instance on any day of the week) immediately prior to the week in which such annual meeting shall convene, in a newspaper printed in the English language and of general circulation in the city or county in which the home office of the association is located, or mailed postage prepaid at least 15 days and not more than 30 days prior to the date on which such annual meetings shall convene to each of its members of record at his last address appearing on the books of the association. Such notice shall state the name of the association, the place of the annual meeting and the time when it shall convene. A similar notice shall be posted in a conspicuous place in each of the offices of the association during the 14 days immediately preceding the date on which such annual meeting shall convene. If any member, in person or by attorney thereunto authorized, shall waive in writing notice of any annual meeting of members, notice thereof need not be given to such member.

(b) Notice of each special meeting shall be either published once a week for the two consecutive calendar weeks (in each instance

on any day of the week) immediately prior to the week in which such special meeting shall convene, in a newspaper printed in the English language and of general circulation in the city or county in which the home office of the association is located, or mailed postage prepaid at least 15 days and not more than 30 days prior to the date on which such special meeting shall convene to each of its members of record at his last address appearing on the books of the association. Such notice shall state the name of the association, the purpose or purposes for which the meeting is called, the place of the special meeting and the time when it shall convene. A similar notice shall be posted in a conspicuous place in each of the offices of the association during the 14 days immediately preceding the date on which such special meeting shall convene. If any member, in person or by attorney thereunto authorized, shall waive in writing notice of any special meeting of members, notice thereof need not be given to such member.

4. *Meetings of the board of directors.* The board of directors shall meet regularly without notice at the home office of the association at least once each month at the hour and date fixed by resolution of the board of directors, provided that the place of meeting may be changed by the directors. Special meetings of the board of directors may be held at any place in the territory in which the association may make loans specified in a notice of such meeting and shall be called by the secretary upon the written request of the president, or of three directors. All special meetings shall be held upon at least 3 days' written notice to each director unless notice be waived in writing before or after such meeting. Such notice shall state the place, time, and purposes of such meeting. A majority of the directors shall constitute a quorum for the transaction of business. The act of a majority of the directors present at any meeting at which there is a quorum shall be the act of the board of directors. All meetings of the board of directors shall be conducted in accordance with Roberts' Rules of Order.

5. *Officers, employees, and agents.* Annually at the meeting of the board of directors of the association next following the annual meeting of the members of the association, the board of directors shall elect a president, one or more vice presidents, a secretary, and a treasurer: *Provided,* That the offices of secretary and treasurer may be held by the same person, and a vice president may also be either the secretary or the treasurer. The board of directors may appoint such additional officers and such employees and agents as it may from time to time determine. The term of office of all officers shall be one year or until their respective successors are elected and qualified; but any officer may be removed at any time by the board of directors. In the absence of designation from time to time of powers and duties by the board of directors, the officers shall have such powers and duties as generally pertain to their respective offices.

6. *Resignation of directors.* Any director may resign at any time by sending a written notice of such resignation to the office of the association delivered to the secretary. Unless otherwise specified therein, such resignation shall take effect upon receipt thereof by the secretary. More than three consecutive absences from regular meetings of the board of directors, unless excused by resolution of the board of directors, shall automatically constitute a resignation, effective when such resignation is accepted by the board of directors.

7. *Powers of the board.* The board of directors shall have power—

(a) To appoint and remove by resolution the members of an executive committee, the members of which shall be directors, which committee shall have and exercise the powers

of the board of directors between the meetings of the board of directors;

(b) To appoint and remove by resolution the members of such other committees as may be deemed necessary and prescribe the duties thereof;

(c) To fix the compensation of directors, officers, and employees; and to remove any officer or employee at any time with or without cause;

(d) To extend leniency and indulgence to borrowing members who are in distress and generally to compromise and settle any debts and claims;

(e) To limit payments on capital which may be accepted;

(f) To reject any application for savings accounts or membership; and

(g) To exercise any and all of the powers of the association not expressly reserved by the charter to the members.

8. *Execution of instruments, generally.* All documents and instruments or writings of any nature shall be signed, executed, verified, acknowledged, and delivered by such officers, agents, or employees of the association or any one of them and in such manner as from time to time may be determined by resolution of the board of directors. All notes, drafts, acceptances, checks, endorsements, and all evidences of indebtedness of the association whatsoever shall be signed by such officer or officers or such agent or agents of the association and in such manner as the board of directors may from time to time determine. Endorsements for deposit to the credit of the association in any of its duly authorized depositories shall be made in such manner as the board of directors may from time to time determine. Proxies to vote with respect to shares or accounts of other associations or stock of other corporations owned by or standing in the name of the association may be executed and delivered from time to time on behalf of the association by the president or a vice president and the secretary or an assistant secretary of the association or by any other person or persons thereunto authorized by the board of directors.

9. *Savings account certificates.* Such officers or employees as may be designated by the board of directors shall deliver to each person upon the initial payment on his savings account in the association an account book or other written evidence of such account.

10. *Seal.* The seal shall be two concentric circles between which shall be the name of the association. The year of incorporation, the word "incorporated", or an emblem may appear in the center.

11. *Amendment.* These bylaws may be amended at any time by a two-thirds affirmative vote of the board of directors, or by a vote of the members of the association. Each and every amendment shall be subject to the approval of the Home Loan Bank Board, and shall be ineffective until such approval shall be given: *Provided*, That, without the approval of the Home Loan Bank Board, section 1 of the bylaws may be amended so that the time of day for convening the annual meeting may be fixed at any hour not earlier than 10 a. m. or later than 9 p. m., and a section providing for a bonus may be added or repealed as provided in the rules and regulations for the Federal Savings and Loan System.

§ 144.6 *Amendment to bylaws.* This section constitutes approval by the Board of any one or more of the following amendments to the bylaws of any Federal association, upon the valid adoption of any such amendment by such association's directors or members as provided in its bylaws, effective when so adopted:

(a) *Nominating committee.* The president, at least 30 days prior to the date of each annual meeting, shall appoint

a nominating committee of three persons who are members of the association. Such committee shall make nominations for directors in writing, and deliver to the secretary such written nominations at least 15 days prior to the date of the annual meeting, which nominations shall forthwith be posted in a prominent place in the home office for the 15 days' period prior to the date of the annual meeting. *Provided* such committee is appointed and makes such nominations, no nominations for directors except those made by the nominating committee shall be voted upon at the annual meeting unless other nominations by members are made in writing and delivered to the secretary of the association at least 10 days prior to the date of the annual meeting, which nominations shall forthwith be posted in a prominent place in the home office for the 10 days' period prior to the date of the annual meeting. Ballots bearing the names of all persons nominated by the nominating committee and by other members prior to the annual meeting shall be provided for use by the members at the annual meeting. If at any time the president shall fail to appoint such nominating committee, or the nominating committee shall fail or refuse to act at least 15 days prior to the annual meeting, nominations for directors may be made at the annual meeting by any member and shall be voted upon.

(b) *New business.* Any new business to be taken up at the annual meeting, including any proposal to increase or decrease the number of directors of the association, shall be stated in writing and filed with the secretary of the association on or before thirty (30) days before the date of the annual meeting, and all business so stated, proposed and filed shall be considered at the annual meeting, but no other proposal shall be acted upon at the annual meeting. Any member may make any other proposal at the annual meeting and the same may be discussed and considered, but unless stated in writing and filed with the secretary thirty (30) days before the meeting such proposal shall be laid over for action at an adjourned, special or regular meeting of the members taking place thirty (30) days or more thereafter. This provision shall not prevent the consideration and approval or disapproval at the annual meeting of the reports of officers and committees, but in connection with such reports no new business shall be acted upon at such annual meeting unless stated and filed as herein provided.

(c) *Voting by proxy.* Voting at any annual or special meeting of the members may be made by proxy, it being provided that no proxies shall be voted at any meeting unless such proxies shall have been placed on file with the secretary of the association, for verification, at least five (5) days prior to the date on which such meeting shall convene.

(d) *Number of directors.* The number of directors of the association shall be -----

(e) *Bonus accounts.* The association shall be obligated to pay a bonus for regular payments on savings accounts upon the bonus plan set forth in the

rules and regulations made by the Home Loan Bank Board.

AVAILABILITY

§ 144.7 *In offices of association.* A Federal association shall cause a true copy of its charter and bylaws, including any amendments thereto, to be at all times available to the members of such association in each of its offices, and shall deliver a copy of such charter and bylaws to any member upon request.

AUTHORITY: §§ 145.1 to 145.27 issued under secs. 4 (a), 5 (a), 48 Stat. 129, 132; 12 U. S. C. 1463 (a), 1464 (a); Reorg. Plan No. 3 of 1947, 12 F. R. 4981, 3 CFR, 1947 Supp.

CAPITAL

§ 145.1 *Savings accounts.* The capital of a Federal association may be raised through payments on its savings accounts in the form of cash, or of property in which such Federal association is authorized to invest, and in the absence of actual fraud in the transaction, the value of such property, as determined by the board of directors of such Federal association, shall be conclusive. The savings accounts of a Federal association that has a Charter E or a Charter K and which amends such charter to read in the form of Charter N shall continue to have the same rights and privileges and to be subject to the same duties and liabilities as were provided in the charter in effect at the time such savings accounts were created, until exchanged for a savings account issued under the provisions of Charter N. No sales commission shall be paid by any Federal association to any of its officers or directors for the sale of its savings accounts: *Provided*, That any such association may distribute prizes in cash or otherwise to any of its officers or directors in connection with any drive or contest authorized by the association's board of directors for the increase of the association's capital by the development of new savings accounts. Except to the extent expressly authorized by Charter E, no Federal association shall directly or indirectly charge any membership admission, repurchase, withdrawal, or any other fee or sum of money, for the privilege of becoming, remaining, or ceasing to be a holder of a savings account of such Federal association.

§ 145.2 *Evidence of ownership—(a) Signature card.* In connection with the issuance of a savings account a Federal association shall obtain a card containing the signature of the owner of such account or his duly authorized representative and shall preserve such signature card in the records of the association.

(b) *Account books and certificates.* A Federal association that has Charter N shall issue to each holder of its savings accounts an account book, or a separate certificate, evidencing the ownership of the account and the interest of the holder thereof in the capital of such Federal association; except as hereinafter provided, each such certificate shall be in form prescribed by the Board. (The Board has prescribed for use by all Federal associations that have Charter K, forms of certificates evidencing the ownership of savings share accounts, short-term savings share accounts, and investment share accounts; and has prescribed for use by all Federal associations that have Charter N forms of certificates evidencing ownership of savings accounts. Illustrative copies of these forms may be obtained from the Home Loan Bank Board, Washington, D. C., or from any Federal home loan bank.) Any Federal association that has a Charter E may, until otherwise provided by the Board, continue to use the forms of share certificates being issued by such association as of the effective date hereof: *Provided*, That no such form is in conflict with any express provision of such association's charter or bylaws.

(c) *Ownership of record.* A Federal association may treat the holder of record of a savings account as the owner for all purposes without being affected by any notice to the contrary unless such Federal association has acknowledged in writing notice of a pledge of such savings account. Savings accounts of a Federal association shall be transferable only upon the books of the association and upon proper application by the transferee and the acceptance of the transferee as a member upon terms approved by the board of directors.

(d) *Duplicate account books and certificates.* Upon filing with a Federal association by the holder of record as shown by the books of the association, or by his legal representative, of an affidavit to the effect that the certificate or account book evidencing his savings account with the association has been lost or destroyed, and that such certificate or account book has not been pledged or assigned in whole or in part, such Federal association shall issue a new certificate or account book evidencing such savings account in the name of the holder of record: *Provided*, That the board of directors shall, if in its judgment it is necessary, require a bond in an amount sufficient to indemnify the association against any loss which might result from the issuance of such new certificate or account book.

§ 145.3 *Bonus on savings accounts—*

(a) *Creation of bonus plan.* The members of a Federal association which has a charter not inconsistent with the provisions of this section may, by bylaw provision, obligate the association to pay a bonus for regular payments on savings accounts. Thereafter, any member of such association desiring a bonus shall agree to make regular monthly payments of a specified amount on a savings account until the withdrawal value thereof is equal to at least 200 times the agreed monthly payment, and if the agreed monthly payments are made each and every month thereafter until the withdrawal value of such savings account is equal to at least 200 times the agreed monthly payment, without a delay of more than 60 days in the payment of any monthly payment and without any prepayment of more than 12 months, and if within such period no application has been made for withdrawal of any part of such savings account, the bonus shall be payable on the date on which the withdrawal value of such savings account equals or exceeds 200 times the agreed monthly payment. The bonus rate on such savings account shall be 1 percent per annum and the amount of the bonus shall be determined as follows:

Divide the dollar amount of each semi-annual distribution of earnings on such savings account by a figure equal to the annual rate of each such semiannual distribution; and the amount of the bonus shall be the sum of the quotients obtained: *Provided, however*, That if a member who has agreed to make regular monthly payments on a savings account under this plan shall apply for the withdrawal of such account in part or in full, or shall fail to meet any of the other

terms of the bonus agreement after such account shall have reached (1) at least 50, but less than 100, times the agreed monthly payment on such account in accordance with the terms of the agreement, such member shall be entitled to receive, in addition to the withdrawal value of such account, a bonus equivalent to 25 percent of the amount of the reserve for bonus which is, at the time of such withdrawal, properly allocable to such account; (2) at least 100, but less than 150, times the agreed monthly payment, 50 percent of such amount; and (3) at least 150, but less than 200, times the agreed monthly payment, 75 percent of such amount.

(b) *Existing bonus rights.* The holder of a savings account of a Federal association which has a Charter K and which amends such charter by the adoption of Charter N shall, upon the exchange of such savings account for a savings account issued under Charter N, have the rights and privileges, and be subject to the duties and liabilities, provided in this section, as if originally created under the provisions hereof: *Provided*, That the savings account so exchanged entitled the holder thereof, at the time of such exchange, to an interest in any reserve for bonus created under the provisions of such Charter K.

(c) *Bonus Reserve.* A Federal association that is obligated to pay a bonus to any of the holders of its savings accounts for regular monthly payments thereon shall establish and maintain a Reserve for Bonus sufficient to meet the bonus obligation. The board of directors may transfer to surplus or to other reserves any excess in the Reserve for Bonus.

(d) *Abolition of bonus plan.* The members of a Federal association may, by amendment of such association's bylaws, abolish any bonus plan as to savings accounts opened after the effective date of such action.

§ 145.4 *Withdrawals.* When a Federal association that has a Charter N is unable to pay all withdrawal requests within a period of 30 days from the date of receipt of written request therefor, the association shall then number and file all withdrawal requests in the order received and shall proceed in the following manner while any withdrawal request remains unpaid for more than 30 days:

Withdrawal requests shall be paid in the order received and if any holder of a savings account or accounts has requested the withdrawal of more than \$1,000, he shall be paid \$1,000 in order when reached and his withdrawal request shall be charged with such amount as paid and shall be renumbered and placed at the end of the list of withdrawal requests, and thereafter, upon again being reached, shall be paid a like amount, but not exceeding the withdrawal value of his savings account, and until such withdrawal request shall have been paid in full, shall continue to be so paid, renumbered, and replaced at the end of the withdrawal requests on file: *Provided*, That when any such request is reached for payment, such association shall so advise the holder of such savings account by registered mail to his

last address as recorded on the books of the association and, unless such holder shall apply in person or in writing for the payment of such withdrawal request within 30 days from the date of the mailing of such notice, no payment on account of such withdrawal request shall be made and such request shall be cancelled: *And provided further*, That the board of directors shall have absolute right to pay on an equitable basis an amount not exceeding \$200 to any holder of a savings account or accounts in any calendar month and without regard to any other provision of this section.

A Federal association that has a Charter N may not make or purchase new loans or investments in an amount exceeding 20 percent of such association's receipts from holders of its savings accounts and from its borrowers while the association is unable to pay all withdrawal requests within a period of 30 days from the date of request therefor.

§ 145.5 Retirement of Government investments—(a) Upon call. Requests for the retirement of investments in a Federal association by the Secretary of the Treasury and by the Home Owners' Loan Corporation shall be made in accordance with law; the basis for computing the amount which the Secretary of the Treasury or the Home Owners' Loan Corporation may at any time request a Federal association to retire shall be the original amount of separate investments in such association made 5 years or more prior to the date of such request, and the original amount of each such separate investment shall be included in the said basis until such time as the investment would have been fully retired had separate requests been made for the retirement of each such investment and had the retirements been applied accordingly. Retirements shall be applied to the investment first made by the Secretary of the Treasury or the Home Owners' Loan Corporation and not previously retired.

(b) Prior to call date. A Federal association may retire investments by the Secretary of the Treasury and by the Home Owners' Loan Corporation in advance of the date on which such investments may be called for retirement by requesting from time to time voluntary withdrawal of investments by the Secretary of the Treasury and by the Home Owners' Loan Corporation in the same order as applications for retirement of such investments would be made by the Secretary of the Treasury or the Home Owners' Loan Corporation under the provisions of law and of this section. All such retirements will be deducted from the next succeeding calls for retirement which the Secretary of the Treasury or the Home Owners' Loan Corporation is authorized by law and regulation to make, and shall be applied in like manner on retirements made upon call. No request for the privilege of retiring any investment by the Secretary of the Treasury will be approved by the Board unless such request is received by it at its office in Washington, D. C., within 30 days subsequent to the last preceding June 30 or December 31, accompanied by a check, postal money order, or bank draft

in the amount of the investment sought to be retired together with any net earnings declared but unpaid.

(c) Return of evidence of investment. The receipt, certificate or other evidence of investment by the Secretary of the Treasury or the Home Owners' Loan Corporation will be returned to a Federal association upon the retirement in full of the investment represented by such instrument; partial retirements of investments will be evidenced by appropriate endorsement on the receipt, certificate or other evidence of the investment.

(d) Withdrawal fee. No Federal association shall charge any withdrawal, repurchase or other fee or sum of money for or in connection with the retirement of any investment in such association by the Secretary of the Treasury or by the Home Owners' Loan Corporation.

LOANS

§ 145.6 Real estate loans.

§ 145.6-1 Lending powers under sections 13 and 14 of Charter K. Any Federal association which has Charter K may under sections 13 and 14 thereof, make the following types of loans on the security of first liens on improved real estate and the use by such an association of loan plans, practices, and procedures which comply with the applicable provisions of §§ 145.6 to 145.6-13, are hereby approved by the Board:

(a) Homes or combination of homes and business property—(1) Monthly installment loans. Installment loans may be made on homes or combination of homes and business property for an amount not in excess of 75 percent of the value thereof, repayable monthly within 20 years or, if an insured or guaranteed loan, within the period acceptable to the insuring or guaranteeing agency: *Provided*, That, when the members of such an association have authorized loans to be made for an amount exceeding 75 percent of the value, such loans may be made up to the percentage of value authorized by the members but not in excess of:

(i) 80 percent of the value, if the loan is not an insured or guaranteed loan;

(ii) The maximum percentage of the value acceptable to the insuring agency, if an insured loan;

(iii) 80 percent of the value, plus the amount guaranteed if a guaranteed loan.

(2) Other installment loans. Loans of any type that such an association may make on a monthly installment basis may also be made with interest payable at least semi-annually and with regular periodic principal installments payable at least annually in an amount sufficient to retire the debt, interest and principal, within 5 years, or, subject to the limitations of § 145.6-7 (for which purpose all such loans as are not fully repayable within 5 years shall be deemed "Non-installment Loans"), within 15 years: *Provided*, That insured or guaranteed loans may be repayable upon such terms as are acceptable to the insuring or guaranteeing agency.

(3) Loans without full amortization. Loans of any type that such an association may make on a monthly installment basis may also be made without full

amortization of principal: *Provided*, That except for insured or guaranteed loans, interest shall be payable at least semi-annually and any such loan may be made for an amount not in excess of 50 percent of the value and for a term of not more than 5 years: *And provided further*, That, if the members have authorized loans to be made without full amortization up to such higher percentage, such loans may be made for an amount not in excess of 60 percent of the value and for a term of not more than 3 years.

(b) Other improved real estate—(1) Monthly installment loans. Installment loans may be made on other improved real estate for an amount not in excess of 50 percent of the value thereof, repayable monthly within 20 years or, if an insured or guaranteed loan, within the period acceptable to the insuring or guaranteeing agency: *Provided*, That, when the members of such an association have authorized loans to be made upon such security for an amount exceeding 50 percent of the value, such loans may be made up to the percentage of value authorized by the members but not in excess of:

(i) The maximum percentage acceptable to the insuring agency, if an insured loan;

(ii) 75 percent of the value of five-family or six-family residential property;

(iii) 60 percent of the value of residential property for more than six families but for not more than twelve families;

(iv) 66⅔ percent of the value of property used primarily for residential purposes: *Provided*, That the loan is an installment loan repayable monthly within a period of 15 years;

(v) 60 percent of the value of real estate which is improved by an income-producing structure thereon: *Provided*, That the loan is an installment loan repayable monthly within a period of 15 years;

(vi) The percentage of value that such an association may otherwise lend under this paragraph plus the amount guaranteed, if a guaranteed loan: *Provided*, That any percentage of value may be loaned if at least 20 percent of the loan is guaranteed.

(2) Other loans. Loans of any type that such an association may make on a monthly installment basis may also be made upon any other plan of repayment: *Provided*, That, except for insured or guaranteed loans, interest shall be payable at least semi-annually and any such loan may be made for an amount not in excess of 50 percent of the value and for a term of not more than 5 years: *And provided further*, That, if the members have authorized loans to be made without full amortization up to such higher percentage of the value of other improved real estate used primarily for residential purposes, such loans may be made for an amount not in excess of 60 percent of the value thereof and for a term of not more than 3 years.

§ 145.6-2 Lending powers under sections 11 and 12 of Charter E. Any Federal association which has Charter E may, under sections 11 and 12 thereof, make monthly installment loans, re-

payable in not less than 5 nor more than 20 years, on the security of first liens on homes or combination of homes and business property for an amount not in excess of 75 percent of the value thereof, and on other improved real estate for an amount not in excess of 50 percent of the value thereof.

§ 145.6-3 Lending powers under other charter provisions. Any Federal association that has amended Charter K by the addition thereto of section 14.1 and any Federal association which has a charter in any other form not inconsistent with the provisions of §§ 145.6 to 145.6-13, may upon authorization by its board of directors and without further action by its members, make the following types of loans and the use by any such association of the applicable loan plans, practices, procedures, and maximum lending percentages is hereby approved by the Board:

(a) Any loan that a Federal association which has Charter K may make under § 145.6-1;

(b) Any guaranteed loan on the security of a lien other than a first lien on real estate: *Provided*, At least 20 percent of the loan is guaranteed.

§ 145.6-4 Participation loans. Any Federal association may participate with other lenders in making loans of any type that such an association may otherwise make: *Provided*, That:

(a) The real estate security is located within such association's regular lending area;

(b) Each of the lenders is either an instrumentality of the United States Government or is insured by the Federal Savings and Loan Insurance Corporation or by the Federal Deposit Insurance Corporation.

§ 145.6-5 Purchase of loans. Any Federal association may purchase loans of any type that it may make: *Provided*, That no loan may be purchased from an affiliated institution without the prior approval of the Board, or from a director, officer or employee of such association, or from any person or firm regularly serving such association in the capacity of attorney-at-law: *And provided further*, That if such an association increases its savings accounts as a part of any such purchase it shall obtain such approval as is required by the rules and regulations for insurance of accounts.

§ 145.6-6 Lending area. The regular lending area of a Federal association consists of the area within a radius of fifty miles from such association's home office and, in the case of a Federal association which is converted from a State-chartered institution, that territory beyond fifty miles from its home office in which such association made loans while operating under State charter. Any Federal association may make loans in its regular lending area and, within the 15-percent-of-assets limitation as defined in § 145.6-7, in other territory: *Provided*, That such association shall comply with the provisions of the rules and regulations for insurance of accounts with respect to loans on the security of real estate located more than fifty miles from the association's home

office. Each converted association that desires to continue to make loans beyond fifty miles from its home office in territory in which it made loans while operating under State charter shall file with the Board a map showing the territory within which such association made loans while operating under State charter. For the purpose of this section a county is the unit of "territory" in which a converted association made loans beyond a radius of fifty miles from its home office while operating under State charter.

§ 145.6-7 Real estate loans and investments subject to 15-percent-of-assets limitation. Any Federal association may make loans of the types enumerated in paragraphs (a) through (d) of this section on the security of first liens on improved real estate only when the resulting aggregate amount of the following investments does not exceed 15 percent of the association's assets:

(a) Loans in excess of \$20,000, after deducting each part of any such loan, if secured by a blanket mortgage, which is apportionable in an amount not exceeding \$20,000 to each home or combination of home and business property which is a part of the security;

(b) Loans on other improved real estate;

(c) Loans on improved real estate located beyond the association's regular lending area;

(d) Non-installment loans;

(e) Real estate owned, except

(1) Property owned and occupied by the association as an office;

(2) Homes or combination of homes and business property which are located within the regular lending area and which have a book value of not more than \$20,000 each:

Provided, That any guaranteed loan, at least 20 percent of which is guaranteed, made by any Federal association that has amended Charter K by the addition thereto of section 14.1, or by any Federal association which has a charter in any other form not inconsistent with the provisions of §§ 145.6 to 145.6-13, is exempt from the limitations of this section.

§ 145.6-8 Loans to directors, officers, or employees. A Federal association may not make a real estate loan to a director, officer or employee of the association, or to any attorney or firm of attorneys, regularly serving the association in the capacity of attorney at law, or to any partnership in which any such director, officer, employee, attorney or firm of attorneys has any interest, and no real estate loan shall be made to any corporation in which any of such parties are stockholders, except that with the prior approval of its board of directors a real estate loan may be made to a corporation in which no such party owns more than fifteen percent of the total outstanding stock and in which the stock owned by all such parties does not exceed twenty-five percent of the total outstanding stock: *Provided*, That nothing herein shall prohibit a Federal association from making loans on the security of a first lien on the home or combination of home and business property owned and occupied by a director, officer or employee

of an association, or by an attorney or member of a firm of attorneys regularly serving the association in the capacity of attorney-at-law.

§ 145.6-9 Appraisals. No loan shall be made by any Federal association until at least two qualified persons designated by its board of directors shall have submitted a signed appraisal of the real estate security; or, if an insured or guaranteed loan, until two qualified persons designated by the board of directors (one of whom may be the appraiser accepted by the insuring or guaranteeing agency) shall have concurred in or approved, in writing, the valuation assigned to the real estate security by the appraiser accepted by the insuring or guaranteeing agency: *Provided*, That any Federal association which has amended its Charter by the addition thereto of section 14.1 and any Federal association which has a charter in any other form not inconsistent with the provisions of §§ 145.6 to 145.6-13, may, when authorized by its board of directors, make any loan after a qualified person designated by such board of directors shall have submitted a signed appraisal of the real estate security and may make any insured or guaranteed loan on the basis of a valuation of the real estate security furnished to such Federal association by the insuring or guaranteeing agency.

§ 145.6-10 Initial loan charges. No director, officer, or employee of a Federal association, and no person or firm regularly serving such association in the capacity of attorney-at-law, may receive from the association or from any other source any fee or other compensation of any kind in connection with the procuring of any particular loan from or by such association. Borrowers may be required to pay the necessary initial charges in connection with the making of a loan, including the actual costs of title examination, appraisal, credit report, survey, drawing of papers, closing of the loan, and other necessary incidental services and costs in such reasonable amounts as may be fixed by the board of directors; such necessary initial charges may be collected by the association from the borrower and paid to any persons, including any such director, officer, employee, attorney or firm rendering such services. Upon the closing of the loan, the association shall furnish the borrower a loan settlement statement showing in detail the charges or fees the borrower has paid or obligated himself to pay to the association or to any other person in connection with such loan; and a copy of such loan settlement statement shall be retained in the records of the association.

§ 145.6-11 Loan contract. Each loan shall be evidenced by note, bond, or other instrument and shall be secured by such security instrument as is in keeping with sound lending practices in the locality. The loan contract shall provide for full protection to the Federal association and shall be recorded; it shall provide specifically for full protection with respect to insurance, taxes, assessments, other governmental levies, maintenance, and repairs, and it may provide for an assign-

ment of rents and for such other protection as may be lawful or appropriate. Such Federal association may pay taxes, assessments, insurance premiums, and other similar charges for the protection of its interest in the property on which it has loans; all such payments may, when lawful, be added to the unpaid balance of the loan. A Federal association may require life insurance to be assigned to it by its borrowers as additional collateral for loans on the security of real estate; such association may advance premiums on any such life insurance and, when lawful, may add the premium so advanced to the unpaid balance of the loan. A Federal association may require that the equivalent of one-twelfth of the estimated annual taxes, assessments, insurance premiums, and other charges on real estate security, or any of them, be paid in advance to such association in addition to interest and principal payments on its loans, to enable the association to pay such charges as they become due from the funds so received. A Federal association shall keep a record of the status of taxes, assessments, insurance premiums, and other charges on all real estate on which such association has loans or which is owned by it. All loan instruments shall comply with applicable provisions of law, governmental regulations, and the Federal association's charter.

§ 145.6-12 Loan payments. Payments on the principal indebtedness of all loans on real estate security shall be applied direct to the reduction of such indebtedness. Payments on all monthly installment loans, other than construction loans, insured loans, and guaranteed loans, shall begin not later than sixty days after the advance of the loan; insured loans and guaranteed loans may be repayable upon terms acceptable to the insuring or guaranteeing agency and the Board hereby approves for use by any Federal association a loan plan wherein payments on any construction loans that such association may otherwise make under §§ 145.6 to 145.6-13 shall begin not later than 6 months after the date of the first advance. The Board hereby approves for use by any Federal association, except Federal associations that have Charter E, a loan plan wherein the association may require the payment of not more than six months' advance interest on the amount of any prepayment on a loan when the aggregate amount of such prepayments in any one year equals or exceeds twenty percent of the original principal amount of the loan: *Provided*, That the loan contract makes express provision therefor.

§ 145.6-13 Reserve for uncollected interest. A "Reserve for Uncollected Interest" shall be maintained equivalent to all interest in default more than 90 days.

§ 145.7 Loans on savings accounts. Any Federal association may make loans on the security of its savings accounts, whether or not the borrower is the owner of such account: *Provided*, That the association obtains a lien upon, or a pledge of, such savings account as security therefor. No such loan may exceed the

withdrawal amount of the savings account securing the loan or the maximum percentage thereof which the association is authorized by its charter to lend upon such security, whichever is less, and no such loan may be made when the association has any application for withdrawal which has been on file more than 30 days and not reached for payment.

§ 145.8 Unsecured loans. Any Federal association that has amended Charter K by the addition thereto of section 14.1 and any Federal association which has a charter in any other form not inconsistent with the provisions of this section may, upon adoption of such a loan plan by its board of directors, make or purchase:

(a) Any unsecured loan at least 20 percent of which is guaranteed under the provisions of the Servicemen's Readjustment Act of 1944, as now or hereafter amended;

(b) Simple-interest, discount, or gross-charge loans for property alteration, repair, or improvement (except business loans provided by section 503 of the Servicemen's Readjustment Act of 1944, as now or hereafter amended, and not secured by lien on real estate) without the security of a lien upon such property: *Provided*, That:

(1) The net proceeds of any such loan do not exceed \$1,500;

(2) The property is located in such association's regular lending area as defined in § 145.6 (f);

(3) Each such loan is evidenced by one or more negotiable notes, bonds, or other written evidences of debt;

(4) The resulting aggregate amount of all such loans does not exceed an amount equal to 15 percent of such association's assets;

(5) Each such loan is repayable in regular monthly installments within a period of 5 years;

And provided further, That any such loan for property alteration, repair, or improvement that is accepted for insurance under the provisions of the National Housing Act, as now or hereafter amended, or for insurance or guarantee under the provisions of the Servicemen's Readjustment Act of 1944, as now or hereafter amended, may be repayable upon such terms and within such period as are acceptable to the insuring or guaranteeing agency and in an amount not exceeding \$2,500: *Provided*, That no Federal association may make any unsecured loan to a director, officer, or employee of the association, or to any person or firm regularly serving the association in the capacity of attorney-at-law, except for the alteration, repair, or improvement of the home or combination of home and business property owned and occupied by such borrowing director, officer, employee, attorney or firm.

OTHER INVESTMENTS

§ 145.9 Stocks and securities. A Federal association may invest without limit in the obligations of, or obligations guaranteed as to principal and interest by, the United States; in stock of a Federal home loan bank; and in obligations of Federal home loan banks.

§ 145.10 Office building. A Federal association may invest in an office building or buildings, and appurtenances, for the transaction of such association's business, or for the transaction of such business and for rental: *Provided*, That no such investment may be made without the prior approval of the Board if the total amount of the investment exceeds the aggregate amount of the association's general reserves and surplus. A Federal association may not purchase an office building, or any part thereof, or land upon which to erect an office building, from an affiliated institution, from an officer, director or employee of such association, or from a corporation or association in which any officer, director or employee is a stockholder or is an officer, director or employee, or from a partnership in which any officer, director or employee is a partner, without the prior approval of the Board.

BROKERAGE BUSINESS AND SALE OF LOANS

§ 145.11 Restrictions. A Federal association may not engage in the mortgage brokerage business. A Federal association may sell any loan at any time if the total dollar amount of loans sold, including such sale, within the calendar year beginning January 1 immediately preceding the date of such sale, does not exceed a sum equivalent to 20 percent of the dollar amount of all loans held by such Federal association at the beginning of such calendar year. The limitation upon the sale of loans may be adjusted in the case of any Federal association upon application to and approval by the Board. All loans sold shall be sold without recourse, and if under a contract to service the same, then on a basis to provide sufficient compensation to the Federal association to reimburse it for expenses incurred under its service contract.

FIDELITY BONDS

§ 145.12 Bonds for directors, officers, employees, and agents. Each Federal association shall provide and maintain a fidelity bond covering its directors, officers, employees, and agents in the form and amount required by the Federal Savings and Loan Insurance Corporation.

OFFICES

§ 145.13 Home office. The home office of a Federal association is the office established by such association's charter; such association shall be operated from its home office and all branch offices and agencies thereof shall be subject to direction therefrom. A Federal association shall maintain at its home office a complete record of all business transacted at such office and control records of all business transacted at each of its branch offices and agencies.

§ 145.14 Branch office. No Federal association may establish or maintain a branch office without the prior written approval of the Board. Each application by a Federal association for permission to establish or maintain a branch office shall state the need for such branch office; the functions to be performed; the personnel and office facilities to be provided; the estimated annual volume of business, income, and expenses of such

branch office; and shall be accompanied by a proposed annual budget of such association. Any business of a Federal association, except the approval of loans, may be transacted at a branch office, as authorized by its board of directors. A detailed record of all transactions of any branch office of a Federal association shall be maintained at such office and such control records as may be necessary for the proper conduct of such association's business shall be furnished by such branch office to its home office.

§ 145.15 *Agency.* Subject to prior approval by the Board as hereinafter provided, a Federal association may establish and maintain one or more agencies at which any agent of such association may transact its business to the extent authorized by its board of directors: *Provided*, That no loans may be approved and no savings accounts may be opened at any agency of a Federal association. Each application for approval by the Board of the establishment or maintenance of a place of business as an agency of a Federal association shall state the need for such agency; the functions to be performed; the personnel and office facilities to be provided; and the estimated annual volume of business and expenses of such agency. A Federal association may, without approval by the Board, establish or maintain any agency the functions of which are limited to the servicing of loans and contracts, or to the management or sale of real estate owned, or to any combination of such functions; temporary or incidental agencies may likewise be established for individual transactions or for special, temporary purposes. An original record of all business of a Federal association transacted at any agency thereof shall be kept by such agency and such reports of business so transacted shall be made to a branch office or to the home office of such association as are required for the proper conduct and control of the association's affairs.

§ 145.16 *Change of office location.* A Federal association may not move any office from its immediate vicinity without prior approval by the Board. If a Federal association changes the location of its home office as fixed in such association's charter, such charter shall be appropriately amended in accordance with the provisions thereof. Each application to the Board by a Federal association for permission to move any office of such association from its immediate vicinity shall be supported with a statement showing the need for such change of location, the functions to be performed by the office at the new location, and the estimated expense of removal to and of maintenance at the new location.

FISCAL AGENCY

§ 145.17 *Powers and duties.* When designated for that purpose by the Secretary of the Treasury, a Federal association shall perform all such reasonable duties as fiscal agent of the Government specified by the Secretary of the Treasury. Such a Federal association shall exercise only such powers and privileges as a fiscal agent of the Gov-

ernment as are enumerated in regulations prescribed by the Secretary of the Treasury. When the designation for that purpose by any other instrumentality of the United States has been approved by the Board, a Federal association, upon qualification for such employment, shall perform the duties as agent of such instrumentality specified by such instrumentality of the United States. Such a Federal association shall exercise only such powers and privileges as an agent of any other instrumentality of the United States as are prescribed by such other instrumentality of the United States.

BOOK VALUE OF ASSETS

§ 145.18 *Adjustments.* The Board may require that any asset of a Federal association be charged off, to the extent that it has depreciated in value, or that a special reserve or reserves equal to such depreciation in value be set up.

§ 145.19 *Real estate owned.* A Federal association shall appraise each parcel of real estate at the time of acquisition thereof and shall keep a signed copy of such appraisal in its records. A Federal association may not carry real estate on its books for a sum in excess of the total amount invested by the association on account of such real estate, including advances, costs, and improvements, but excluding accrued but uncollected interest.

RECORDS AND REPORTS

§ 145.20 *Accounting.* A Federal association shall maintain a complete record of all business transacted by it and shall use such forms and follow such accounting practices as the Board may from time to time require. A Federal association shall close its books on June 30 and December 31 of each year.

§ 145.21 *Annual reports.* Each Federal association shall make an annual report of its affairs as of December 31 of each year, on forms provided by the Board; and shall forward two copies of each such report to the Federal home loan bank of which the association is a member, within thirty days following the date as of which the report is made.

§ 145.22 *Monthly reports.* The officers of each Federal association shall make a monthly report to the association's board of directors on forms prescribed by the Board; and shall forward one copy of each such report to the Federal home loan bank of which the association is a member and two copies to the Home Loan Bank Board, Washington, D. C. (The Board has approved a form of "Monthly Report," copies of which any Federal association may obtain from any Federal home loan bank.)

§ 145.23 *Statement of condition.* Within the month of January of each year, each Federal association shall either mail to each of its members, at his last address appearing on the association's books, or publish in a newspaper printed in the English language and of general circulation in the county in which the association's home office is located, a statement of condition of the association as of December 31 immediately preced-

ing, in form prescribed by the Board. (The Board has prescribed a form of "Statement of Condition," an illustrative copy of which may be obtained from any Federal home loan bank or from the Home Loan Bank Board, Washington, D. C.) Within five days after each such statement of condition has been so mailed or published, a certification to such effect, signed by an executive officer of such Federal association, together with a copy of the statement of condition, shall be transmitted by the association to the Home Loan Bank Board, Washington, D. C., and to the Federal home loan bank of which the association is a member.

EXAMINATIONS AND AUDITS

§ 145.24 *Supervisory examinations.* Each Federal association shall be examined, with appraisals when deemed advisable, at least annually by the Board.

§ 145.25 *Audits.* Unless a Federal association is audited at least once each year by auditors and in a manner satisfactory to the Board and two copies of such audit, certified by the auditor, are promptly filed with the Board through the Federal home loan bank of which such association is a member, the examination of such association made pursuant to the provisions of § 145.24, shall include an audit.

§ 145.26 *Cost.* The cost, as determined by the Board, of each examination of a Federal association, including office analysis thereof, audit, and any appraisals made in connection therewith, and of other supervision by the Board, shall be paid by such association.

ANNUAL MEETINGS OF MEMBERS

§ 145.27 *Notice.* A Federal association shall either publish a notice of its annual meeting of members once a week for the two successive calendar weeks (in each instance on any date of the week) immediately prior to the week in which such annual meeting shall convene, in a newspaper printed in the English language and of general circulation in the city or county in which the home office of the Federal association is located, or mail a copy of such notice, postage prepaid, at least 15 days and not more than 30 days prior to the date on which such annual meeting shall convene to each of its members of record at his last address appearing upon its books. Such notice shall state the name of the Federal association, the place of the annual meeting and the time when it shall convene. A similar notice shall be posted in a conspicuous place in each office of such Federal association during the 14 days immediately preceding the date on which such annual meeting shall convene.

PART 146—MERGER, DISSOLUTION, AND REORGANIZATION

MERGER

- Sec.
146.1 Definitions.
146.2 Procedure; effective date.
146.3 Transfer of assets upon merger.
146.4 Voluntary dissolution.

AUTHORITY: §§ 146.1 to 146.4 issued under secs. 4 (a), 5, 48 Stat. 129, 132; 12 U. S. C.

1463 (a), 1464; Reorg. Plan No. 3 of 1947, 12 F. R. 4981, 3 CFR, 1947 Supp.

MERGER

146.1 Definitions. As used in §§ 146.2 and 146.3, the term (a) "association" means a Federal association and any building and loan association, savings and loan association, cooperative bank or homestead association organized under the laws of any of the States or Territories of the United States or of the District of Columbia: *Provided*, That any such institution under the laws of the jurisdiction of its creation is empowered to merge or consolidate with a Federal association; (b) "merging association" means any association absorbed by merger; and (c) "resulting association" means the Federal association which continues its corporate existence after absorbing one or more merging associations in a merger effected under the provisions of the rules and regulations in this subchapter.

§ 146.2 Procedure; effective date. Two or more associations may merge in the manner hereinafter set forth: *Provided*, That any merging association which is not a Federal association shall first (a) either be or become a member of a Federal home loan bank; (b) comply with the requirements of law of the jurisdiction of its creation; and (c) obtain the vote to convert required by subsection (i) of section 5 of Home Owners' Loan Act of 1933 (48 Stat. 646; 12 U. S. C. 1464 (i)) as amended:

Each association, by a majority vote of its board of directors, shall approve a plan of merger evidenced by a merger agreement. The merger agreement shall state that it shall not be effective unless and until approved by the Board and shall specify (a) which of the associations is to be the resulting association; (b) the name to be used by the resulting association; (c) the location of the home office of the resulting association; (d) the basis upon which the savings accounts of the resulting association shall be issued; and (e) the number of directors, and the names and residence addresses of all persons chosen to serve as directors of the resulting association, together with the term for which each such director shall serve. Application for approval by the Board of the merger as provided by the said merger agreement shall be made by filing with the Federal home loan bank of which at least one of the associations is a member two copies of the merger agreement, properly executed in the name of the respective associations, and two certified copies of the minutes of all of the meetings of the respective boards of directors at which the plan of merger was considered and approved: and, if any of the merging associations is not a Federal association it shall submit a preliminary application for conversion as provided in § 143.9 of this subchapter. Upon receipt of such application the Board will (a) disapprove the merger; (b) approve the merger; or (c) recommend modifications of the plan of merger as submitted; if the modifications recommended by the Board are accepted by the directors of each of the associations, they shall

thereupon amend such merger agreement accordingly and shall submit the amended merger agreement in the same manner as hereinabove provided.

For the purposes of this section, the approval of a merger involving a merging association which is not a Federal association shall, without the issuance of a charter, constitute the approval by the Board of the conversion of such merging association into a Federal association. In the event that any plan of merger provides for a change of name or change of location of the home office of the resulting association, the charter of such resulting association shall be amended accordingly. The charters of all merging Federal associations shall be surrendered to the Board for cancellation. The effective date of a merger shall be the date on which the merger is approved by the Board unless otherwise stated in such approval; approval of the merger automatically cancels the Federal charter of each of the merging associations as of the effective date of the merger.

§ 146.3 Transfer of assets upon merger. Upon the effective date of the merger, as provided in § 146.2, all of the assets and property of every kind and character, real, personal and mixed, tangible and intangible, choses in action, rights, and credits then owned by the merging associations, or which would inure to any of them, shall immediately by operation of law and without any conveyance or transfer and without any further act or deed, be vested in and become the property of the resulting association, which shall have, hold, and enjoy the same in its own right as fully and to the same extent as if the same were possessed, held, and enjoyed by the merging associations prior to such merger; and the resulting association shall be deemed to be and shall be a continuation of the entity and identity of the Federal association, which absorbed the merging associations; and all of the rights and obligations of the merging associations shall remain unimpaired, and the resulting association, on the effective date of such merger, shall succeed to all of such rights and obligations and the duties and liabilities connected therewith.

§ 146.4 Voluntary dissolution. The board of directors of any Federal association may propose a plan for the dissolution of such association. Such plan may provide for (a) the Federal Savings and Loan Insurance Corporation to be appointed, in accordance with the provisions of sections 405 and 406 of the National Housing Act, as amended (48 Stat. 1259, 49 Stat. 299; 12 U. S. C. 1728, 1729), and pertinent regulations of such corporation, as receiver for the purpose of liquidation; (b) all assets of the association to be transferred to another thrift and home-financing institution under Federal or State charter for a sufficient amount of cash to pay all obligations of the association and to retire all outstanding share accounts up to the amount credited thereto; (c) the transfer of all assets to another thrift and home-financing institution under Federal or State charter in consideration of

the payment of all outstanding obligations of the association and the issuance of share accounts or other evidence of interest to the members of the Federal association on a pro rata basis; or (d) dissolution in such other manner as may be proposed by the directors and which to them appears to be to the best interest of all concerned. Such plan shall thereupon be submitted to the Board for approval, together with a statement of the reasons for proposing dissolution and the reasons for the plan submitted. If it appears to the Board that dissolution is advisable and that the plan of dissolution submitted is in the interest of all concerned, the Board will approve the plan; if the plan submitted appears to be inadvisable, the Board will either make recommendations to the association concerning the plan or disapprove it. When a plan of dissolution has been approved by the board of directors of a Federal association and by the Board, such plan shall be submitted to the members of such association at a duly called meeting and, when approved by a majority of the votes cast at such meeting, shall become effective. When dissolution has been consummated in accordance with the plan approved by the Board, a certificate evidencing that fact, supported by such evidence as the Board may require, shall forthwith be filed with the Board. Upon receipt of evidence satisfactory to the Board that such dissolution has been so consummated, the Board will terminate the corporate existence of the dissolved Federal association and its charter shall thereby be cancelled.

By the Home Loan Bank Board.

[SEAL] J. FRANCIS MOORE,
Secretary.

Chapter VIII—Office of Housing Expediter

[Controlled Housing Rent Reg.¹ Amdt. 129]

PART 825—RENT REGULATIONS UNDER THE HOUSING AND RENT ACT OF 1947, AS AMENDED

VARIOUS STATES

The Controlled Housing Rent Regulation (§§ 825.1 to 825.12) is amended in the following respects:

1. Schedule A, Item 55a, is amended to read as follows:

(55a) [Revoked and decontrolled.]

This decontrols from §§ 825.1 to 825.12 the entire Fort Pierce, Florida, Defense-Rental Area, consisting of St. Lucie County, Florida, on the Housing Expe-

¹ 13 F. R. 5706, 5788, 5789, 5877, 5937, 6246, 6283, 6411, 6556, 6881, 6910, 7299, 7671, 7801, 7862, 8217, 8218, 8327, 8386; 14 F. R. 17, 93, 143, 271, 337, 456, 627, 682, 695, 856, 918, 979, 1005, 1083, 1345, 1394, 1519, 1570, 1571, 1587, 1668, 1667, 1733, 1760, 1823, 1868, 1932, 2959, 2060, 2084, 2176, 2233, 2412, 2441, 2545, 2805, 2807, 2808, 2695, 2746, 2761, 2796, 2897, 3079, 3120, 3152, 3200, 3234, 3280, 3311, 3353, 3399, 3451, 3467, 3494, 3556, 3617, 3672, 3673, 3704, 3705, 3745, 3773.

diter's own initiative in accordance with section 204 (c) of the Housing and Rent Act of 1947, as amended.

2. Schedule A, Item 122, is amended to read as follows:

(122) [Revoked and decontrolled.]

This decontrols from §§ 825.1 to 825.12 (1) the City of Topeka in Shawnee County, Kansas, and all unincorporated localities in Shawnee and Douglas Counties, all being portions of the Topeka-Lawrence, Kansas, Defense-Rental Area, based on a resolution submitted for said City of Topeka in accordance with section 204 (j) (3) of the Housing and Rent Act of 1947, as amended, said City of Topeka constituting the major portion of said Defense-Rental Area, and (2) the remainder of said Defense-Rental Area, on the Housing Expediter's own initiative in accordance with section 204 (c) of said act.

This decontrol of said Topeka-Lawrence Defense-Rental Area shall become effective September 14, 1949.

3. Schedule A, Item 286, is amended to describe the counties in the Defense-Rental Area as follows:

Greene, Hawkins, Unicoi, Washington and Sullivan, except the City of Kingsport.

Independent City of Bristol, and the Counties of Scott and Washington.

This decontrols from §§ 825.1 to 825.12 the City of Kingsport in Sullivan County, Tennessee, a portion of the Bristol-Kingsport, Tennessee, Defense-Rental Area, based on a resolution submitted in accordance with section 204 (j) (3) of the Housing and Rent Act of 1947, as amended.

4. Schedule A, Item 288, is amended to describe the counties in the Defense-Rental Areas as follows:

Montgomery.
Christian and Todd.

This decontrols from §§ 825.1 to 825.12 the County of Trigg, Kentucky, and the County of Stewart, Tennessee, both in the Clarksville, Tennessee, Defense-Rental Area, on the Housing Expediter's own initiative, in accordance with section 204 (c) of the Housing and Rent Act of 1947, as amended.

5. Schedule A, Item 292a, is amended to read as follows:

(292a) [Revoked and decontrolled.]

This decontrols from §§ 825.1 to 825.12 (1) The City of Lenoir City, in the Lenoir City, Tennessee, Defense-Rental Area, based on a resolution submitted in accordance with section 204 (j) (3) of the Housing and Rent Act of 1947, as amended, and (2) the remainder of the said Defense-Rental Area, on the Housing Expediter's own initiative in accordance with section 204 (c) of said act.

6. Schedule A, Item 295b, is amended to read as follows:

(295b) [Revoked and decontrolled.]

This decontrols from §§ 825.1 to 825.12 the entire Paris, Tennessee, Defense-Rental Area, consisting of Henry County, Tennessee, on the Housing Expediter's own initiative in accordance with section 204 (c) of the Housing and Rent Act of 1947, as amended.

7. Schedule A, Item 316, is amended to describe the counties in the Defense-Rental Area as follows:

Tarrant, except Westworth Village.

This decontrols from §§ 825.1 to 825.12 Westworth Village in Tarrant County, Texas, a portion of the Fort Worth, Texas, Defense-Rental Area, based on a resolution submitted in accordance with section 204 (j) (3) of the Housing and Rent Act of 1947, as amended.

8. Schedule A, Item 334b, is amended to read as follows:

(334b) [Revoked and decontrolled.]

This decontrols from §§ 825.1 to 825.12 the entire Price, Utah, Defense-Rental Area, consisting of Carbon County, Utah, on the Housing Expediter's own initiative in accordance with section 204 (c) of the Housing and Rent Act of 1947, as amended.

9. Schedule A, Item 336a, is amended to read as follows:

(336a) [Revoked and decontrolled.]

This decontrols from §§ 825.1 to 825.12 (1) the City of Vernal, in the Vernal, Utah, Defense-Rental Area, based on a resolution submitted in accordance with section 204 (j) (3) of the Housing and Rent Act of 1947, as amended, and (2) the remainder of said Defense-Rental Area, on the Housing Expediter's own initiative in accordance with section 204 (c) of said act.

(Sec. 204 (d), 61 Stat. 197, as amended, 62 Stat. 37, 94, Pub. Law 31, 81st Cong.; 50 U. S. C. App. 1894 (d). Applies sec. 204, 61 Stat. 197, as amended, 62 Stat. 37, 94, Pub. Law 31, 81st Cong.; 50 U. S. C. App. 1894)

This amendment except Item 2 thereof shall become effective July 13, 1949.

Issued this 13th day of July 1949.

TIGHE E. WOODS,
Housing Expediter.

[Controlled Rooms in Rooming Houses and Other Establishments Rent Reg.,¹ Amdt. 124]

PART 825—RENT REGULATIONS UNDER THE HOUSING AND RENT ACT OF 1947, AS AMENDED

VARIOUS STATES

The Rent Regulation for Controlled Rooms in Rooming Houses and Other Establishments (§§ 825.81 to 825.92) is hereby amended in the following respects:

1. Schedule A, Item 55a, is amended to read as follows:

(55a) [Revoked and decontrolled.]

¹ 13 F. R. 5750, 5789, 5875, 5937, 5938, 6247, 6283, 6411, 6556, 6882, 6911, 7299, 7672, 7801, 7862, 8218, 8219, 8328, 8388; 14 F. R. 18, 272, 337, 457, 627, 682, 695, 857, 918, 978, 1083, 1345, 1520, 1570, 1582, 1587, 1669, 1670, 1734, 1759, 1869, 1932, 2061, 2062, 2085, 2176, 2237, 2413, 2440, 2441, 2545, 2607, 2608, 2695, 2746, 2761, 2796, 3079, 3121, 3153, 3201, 3234, 3280, 3311, 3353, 3400, 3451, 3468, 3494, 3555, 3617, 3675, 3705, 3746, 3772.

This decontrols from §§ 825.81 to 825.92 the entire Fort Pierce, Florida, Defense-Rental Area, consisting of St. Lucie County, Florida, on the Housing Expediter's own initiative in accordance with section 204 (c) of the Housing and Rent Act of 1947, as amended.

2. Schedule A, Item 122, is amended to read as follows:

(122) [Revoked and decontrolled.]

This decontrols from §§ 825.81 to 825.92 (1) the City of Topeka in Shawnee County, Kansas and all unincorporated localities in Shawnee and Douglas Counties, all being portions of the Topeka-Lawrence, Kansas, Defense-Rental Area, based on a resolution submitted for said City of Topeka in accordance with section 204 (j) (3) of the Housing and Rent Act of 1947, as amended, said City of Topeka constituting the major portion of said Defense-Rental Area, and (2) the remainder of said Defense-Rental Area, on the Housing Expediter's own initiative in accordance with section 204 (c) of said act.

This decontrol of said Topeka-Lawrence Defense-Rental Area shall become effective September 14, 1949.

3. Schedule A, Item 286, is amended to describe the counties in the Defense-Rental Area as follows:

Greene, Hawkins, Unicoi, Washington, and Sullivan, except the city of Kingsport.

Independent City of Bristol, and the Counties of Scott and Washington.

This decontrols from §§ 825.81 to 825.92 the City of Kingsport in Sullivan County, Tennessee, a portion of the Bristol-Kingsport, Tennessee, Defense-Rental Area, based on a resolution submitted in accordance with section 204 (j) (3) of the Housing and Rent Act of 1947, as amended.

4. Schedule A, Item 288, is amended to describe the counties in the Defense-Rental Areas as follows:

Montgomery.
Christian and Todd.

This decontrols from §§ 825.81 to 825.92 the County of Trigg, Kentucky, and the County of Stewart, Tennessee, both in the Clarksville, Tennessee, Defense-Rental Area, on the Housing Expediter's own initiative, in accordance with section 204 (c) of the Housing and Rent Act of 1947, as amended.

5. Schedule A, Item 292a, is amended to read as follows:

(292a) [Revoked and decontrolled.]

This decontrols from §§ 825.81 to 825.92 (1) The City of Lenoir City in the Lenoir City, Tennessee, Defense-Rental Area, based on a resolution submitted in accordance with section 204 (j) (3) of the Housing and Rent Act of 1947, as amended and (2) the remainder of the said Defense-Rental Area, on the Housing Expediter's own initiative, in accordance with section 204 (c) of said act.

6. Schedule A, Item 295b, is amended to read as follows:

(295b) [Revoked and decontrolled.]

This decontrols from §§ 825.81 to 825.92 the entire Paris, Tennessee, Defense-Rental Area, consisting of Henry County, Tennessee, on the Housing Expediter's own initiative, in accordance with section

204 (c) of the Housing and Rent Act of 1947, as amended.

7. Schedule A, Item 316, is amended to describe the counties in the Defense-Rental Area as follows:

Tarrant, except Westworth Village.

This decontrols from §§ 825.81 to 825.92 Westworth Village in Tarrant County, Texas, a portion of the Fort Worth, Texas, Defense-Rental Area, based on a resolution submitted in accordance with section 204 (j) (3) of said act.

8. Schedule A, Item 334b, is amended to read as follows:

(334b) [Revoked and decontrolled.]

This decontrols from §§ 825.81 to 825.92 the entire Price, Utah, Defense-Rental Area, consisting of Carbon County, Utah, on the Housing Expediter's own initiative in accordance with section 204 (c) of the Housing and Rent Act of 1947, as amended.

9. Schedule A, Item 336a, is amended to read as follows:

(336a) [Revoked and decontrolled.]

This decontrols from §§ 825.81 to 825.92 (1) the City of Vernal, of the Vernal, Utah, Defense-Rental Area, based on a resolution submitted in accordance with section 204 (j) (3) of the Housing and Rent Act of 1947, as amended, and (2) the remainder of said Defense-Rental Area, on the Housing Expediter's own initiative in accordance with section 204 (c) of said act.

(Sec. 204 (d), 61 Stat. 197, as amended, 62 Stat. 37, 94, Pub. Law 31, 81st Cong.; 50 U. S. C. App. 1894 (d)). Applies sec. 204, 61 Stat. 197, as amended, 62 Stat. 37, 94, Pub. Law 31, 81st Cong.; 50 U. S. C. App. 1894)

This amendment, except Item 2 thereof shall become effective July 13, 1949.

Issued this 13th day of July 1949.

TIGHE E. WOODS,
Housing Expediter.

TITLE 26—INTERNAL REVENUE

Chapter I—Bureau of Internal Revenue, Department of the Treasury

Subchapter C—Miscellaneous Excise Taxes

[T. D. 42]

PART 151—REGULATIONS UNDER THE HARRISON NARCOTIC LAW, AS AMENDED

ANNUAL INVENTORIES OF NARCOTIC SUBSTANCES IN POSSESSION OF MANUFACTURERS AND WHOLESALERS

Narcotic Regulations 5 (26 CFR, Part 151) relating to narcotics subject to the Harrison Narcotic Law, but only as prescribed and made applicable to the Internal Revenue Code by Treasury Decision 4884, approved February 11, 1939 (26 CFR, Cum. Supp., p. 5875) are amended as follows:

PARAGRAPH 1. Article 155 (26 CFR 151.155) is amended to read as follows:

§ 151.155 *Form 810e: Manufacturers, producers, compounders.* Each manu-

facturer, producer or compounder registered in Class I under the act shall render as a part of his December return on Form 810 a detailed inventory on Form 810e of all narcotic substances, except those specifically required by Articles 156 and 157 (26 CFR 151.156, 151.157) to be reported on other forms, which are in his possession on December 31 of each year, classified and grouped as follows:

- (a) Raw materials.
- (b) Goods in process.
- (c) Finished bulk stock.
- (d) Finished goods in marketable packages.
- (e) Miscellaneous stock.

PAR. 2. Article 156 (26 CFR 151.156) is amended to read as follows:

§ 151.156 *Form 163b: Manufacturers importing opium.* Each manufacturer who imports crude opium shall, in addition to the inventory required by Article 155 (26 CFR 151.155), render an inventory on Form 163b of crude opium, goods in process of manufacture from crude opium, and substances resulting from such processes of manufacture which have not been transferred to the return on Form 810, which are in his possession as an opium importing manufacturer on December 31 of each year. Each inventory on Form 163b shall group the substances on hand on separate sheets in accordance with the classifications in the summaries of Forms 163 and 163a and each sheet shall be numbered to correspond with the appropriate line and summary numbers of such Forms 163 and 163a. Each such inventory shall be made a part of the return rendered on Form 163 for the month or quarter ending with the date for which the inventory is rendered.

PAR. 3. Article 157 (26 CFR 151.157) is amended to read as follows:

§ 151.157 *Form 168b: Manufacturers importing medicinal coca leaves.* Each manufacturer who imports coca leaves for the manufacture of medicinal products shall, in addition to the inventory required by Article 155 (26 CFR 151.155), render an inventory on Form 168b of raw coca leaves, goods in process of manufacture from such leaves and substances resulting from such processes of manufacture which have not been transferred to the return on Form 810, which are in his possession as a coca leaf importing manufacturer on December 31 of each year. Each inventory on Form 168b shall group the substances on hand on separate sheets in accordance with the classifications in the summaries of Forms 168 and 168a and each sheet shall be numbered to correspond with the appropriate line and summary numbers of such Forms 168 and 168a. Each such inventory shall be made a part of the return rendered on Form 168 for the month or quarter ending with the date for which the inventory is rendered.

PAR. 4. Article 158 (26 CFR 151.158) is amended to read as follows:

§ 151.158 *Form 811c: Wholesale dealers.* Every wholesale dealer shall render, as part of his December return on Form 811, an inventory, on Form 811c, of taxable narcotic drugs on hand on

December 31 of each year. A separate entry shall be made with respect to each kind of drug or preparation, and each kind or size of package. Each entry shall show the name, quantity, and narcotic content of the drug or preparation and the size of the individual package, the number of packages, and the total narcotic content of all the packages covered by the entry, classified according to the kind of narcotic contained in the drug or preparation.

(Secs. 2555, 2559, 2606 and 3791, Internal Revenue Code, 53 Stat. 273, 277, 283, 467; 26 U. S. C. 2555, 2559, 2606, 3791)

Because the amendments made by this Treasury decision merely reduce the burden of persons subject to the regulations, it is found unnecessary to issue this Treasury decision with notice and public procedure thereon under section 4 (a) of the Administrative Procedure Act, approved June 11, 1946, or subject to the effective date limitation of section 4 (c) of said act.

This Treasury decision shall be effective upon its filing for publication in the FEDERAL REGISTER.

[SEAL] H. J. ANSLINGER,
Commissioner of Narcotics.
GEORGE SCHOENEMAN,
Commissioner of Internal Revenue.

Approved: June 29, 1949.

EDWARD H. FOLEY, Jr.,
Acting Secretary of the Treasury.

[F. R. Doc. 49-5818; Filed, July 15, 1949; 8:53 a. m.]

TITLE 39—POSTAL SERVICE

Chapter I—Post Office Department

PART 3—MISCELLANEOUS PROVISIONS RELATING TO THE DEPARTMENT AND THE POSTAL SERVICE

DAMAGE TO PERSON OR PROPERTY BY POSTAL OPERATIONS

In § 3.5 *Damage to person or property by postal operations* (13 F. R. 8850) amend subparagraph (7) of paragraph (n) to read as follows:

(n) *Investigations and reports of accidents.* * * *

(7) *Accidents; assignment of counsel for postal employees.* (i) City carriers, rural carriers, special delivery messengers, highway postoffice operators, motor vehicle personnel, and all other post office employees involved in traffic accidents while operating either Government-owned or privately owned vehicles of any kind in the performance of their official duties should be defended by counsel in all such cases, both civil and criminal.

(ii) Where the contemplated court action is set for a date two weeks or more distant the postmaster or district superintendent, Railway Mail Service, should transmit all available supporting papers to the appropriate Bureau and division of the Department and request that counsel be assigned. Where the court action is set for a date less than two weeks distant, the postmaster or district superintendent should take up the mat-

ter direct with the post office inspector in charge or the post office inspector of his district and furnish him all available papers in order that he may immediately present the case to the United States attorney. The Attorney General has instructed United States attorneys to provide counsel upon request of an inspector in such cases.

(iii) These instructions are authority to contact the post office inspector in charge or a post office inspector and to furnish him with all available papers pertaining to the case, in those instances where it is apparent that an immediate assignment of counsel to defend the postal employee is desirable. In such urgent cases, it will be necessary, however, that two copies of the letter to the post office inspector in charge or the post office inspector on the subject be forwarded to the appropriate Bureau and division of the Department.

(iv) The foregoing instructions apply to the assignment of counsel to postal employees only, and under no circumstances should counsel be requested to defend the owners of contract vehicles or drivers employed by such contractors.

(R. S. 161, 396, Secs. 304, 309, 42 Stat. 24, 25; 5 U. S. C. 22, 369)

[SEAL]

J. M. DONALDSON,
Postmaster General.

TITLE 41—PUBLIC CONTRACTS

Chapter II—Division of Public Contracts, Department of Labor

PART 202—MINIMUM WAGE DETERMINATIONS

FLINT GLASS INDUSTRY; DETERMINATION

This matter is before the Department pursuant to the act of June 30, 1936 (49 Stat. 2036; 41 U. S. C. secs. 35-45) entitled "An act to provide conditions for the purchase of supplies and the making of contracts by the United States, and for other purposes," otherwise known as the Walsh-Healey Public Contracts Act. It arises upon the petition of the American Flint Glass Workers' Union of North America that the Secretary of Labor determine the prevailing minimum wage for the Flint Glass Industry to be at least 90 cents an hour. The minimum wage of 42½ cents an hour currently in effect for this industry was determined by the Acting Secretary of Labor on June 27, 1938 (41 CFR, Cum. Supp., 202.18).

General. Notice of a hearing on the Union's petition was published in the *FEDERAL REGISTER* (14 F. R. 188). Copies of the notice and of a press release were mailed to trade associations, unions, and to all individual companies in the industry as shown by the Glass Factory Year Book and Directory (1947 edition). In addition, the press release was distributed to newspapers, trade publications and trade associations.

This notice and release advised interested persons of the time and place at which they could appear and offer testimony: (1) As to what is the prevailing minimum wage in the industry;

(2) as to whether there should be included in any amended determination for this industry provision for the employment of learners at a subminimum rate, and, if so, in what occupations, at what subminimum rates, and with what limitations as to length of the learning period and number of proportions of learners; and (3) to the proposed definition of the industry. The notice also provided that written statements in lieu of personal appearance could be filed at any time prior to the hearing or with the presiding officer at the hearing. It also stated that a tabulation by the Bureau of Labor Statistics showing wages paid in the industry as of January 1947 would serve as a basis of discussion at the hearing, and that copies of such tabulation would be available to interested persons upon request.

The hearing was held on February 9, 1949, the date scheduled in the notice. Representatives of employees and of employers testified, and the record was kept open for a specified period beyond the close of the hearing for receipt of specified additional data.

Title and definition. The notice of hearing advised interested persons that it was proposed, in conjunction with a reconsideration of the prevailing minimum wage for the industry, to redesignate the industry as the pressed and blown glass and glassware industry, and to define the industry as set forth in the notice.

At the hearing a Union representative requested that the proposed definition be amended so as to make more clear the fact that the production of chemical and laboratory glassware was covered by the proposed definition of the industry. The proposed definition does include such production, but after discussion both parties agreed that the insertion of the words "chemical and laboratory glassware" following the word "tubing" in the inclusionary part of the proposed definition was desirable and would accomplish the purpose sought. Such proposed change has been incorporated in the definition of the pressed and blown glass and glassware industry as herein-after set forth.

A representative of a firm engaged in the production of fiberglass products requested that such products be excluded from the proposed definition. He argued that his company is not part of the industry under discussion and does not compete with firms in the industry. He admitted, however, that his company forms molten glass in a tank as it done generally in the industry but claimed that its subsequent functions and processes were entirely different. He testified that the company's lowest wage rate is about 92 cents an hour, and stated that as regards its production of insulation the company is in competition with manufacturers of rockwool and similar insulation rather than with producers in the glass industry. A Union representative argued that all glass and glassware products except flat glass and glass containers should be included in the definition of the industry and called attention to a similarity of manufacturing processes. Government representatives called attention

to the fact that the proposed definition covers only basic fiber-glass products, including insulation products, and does not cover the production of woven glass fabric, and that the definition of the industry in the current determination has been interpreted in this manner. On the basis of the record it would appear that no reason exists why such interpretation should not be continued and the definition is therefore amended to include the words "fiberglass and foamglass products except tapes and other woven fabrics" as set forth in the proposed definition.

Other than these two suggested changes, there was no objection raised to the proposed redesignation and definition of the industry, and such change of title and definition are adopted herein.

Minimum wage. Representatives of the American Flint Glass Workers' Union of North America, the petitioning union, appeared at the hearing on behalf of the employees and testified that the collective bargaining agreements negotiated by the Union covered approximately 90 percent of the industry's employees. The views of employers were presented at the hearing by representatives of the National Association of Manufacturers of Pressed and Blown Glassware, the American Glassware Association and the Scientific Apparatus Makers' Association. A representative of the National Association of Manufacturers of Pressed and Blown Glassware testified that Association members employed over half of the workers in the industry and the representative of the American Glassware Association testified that his association represented about 80 percent of the dollar sales volume at factory level of glassware included in the industry as defined for the purpose of this proceeding, and approximately 40 percent of the total number of manufacturers that are engaged in the production of such glassware. It would therefore appear that, in terms of numbers or proportion, both the employers and the employees of the industry were adequately represented.

At the hearing Union representatives requested that the prevailing minimum wage for the industry be determined by the Secretary of Labor as 90 cents an hour. Industry representatives argued that the Secretary of Labor should find as such minimum wage the rate applicable to the lowest job classifications in the collective bargaining agreements in the industry, i. e., 83½ cents an hour.

Copies of collective bargaining agreements between the Union and the employers represented by the National Association of Manufacturers of Pressed and Blown Glassware were offered in evidence at the hearing to show the plant minimum wage rates and minimum rates for the various job classifications in the "miscellaneous" divisions of the hand plants, combination plants, and automatic machine plants. Such minima were agreed to in the last annual joint conference of representatives of The National Association of Manufacturers of Pressed and Blown Glassware, and the American Flint Glass Workers' Union of North America held in October 1948, and are currently in effect. These contracts show that, except for beginners,

the wage for the lowest occupational groups is, in fact, 83½ cents an hour.

As above stated, the representative of the National Association of Manufacturers of Pressed and Blown Glassware testified that members of the Association employ more than half of the workers in the industry, all production workers being covered by collective bargaining agreements with the American Flint Glass Workers Union of North America. The testimony of employer and employee representatives also shows that the agreements between the Union and the Association have become the pattern for union agreements covering practically all plants in the industry. A Union representative enumerated about a dozen production and cutting plants, and stated that while some pay rates equal to or higher than rates specified in union agreements, most of them pay less.

There was also introduced as evidence at the hearing a report showing the results of a comprehensive survey by the Bureau of Labor Statistics of the wage structure in the Glassware Industry in January 1947, together with adjusted percentage distributions reflecting approximately the two general wage increases as provided in union agreements effective August 1947 and August 1948.

The wage distributions prepared by the Bureau of Labor Statistics showed that in September 1948 the straight-time average hourly earnings of the 39,827 plant workers employed in glass and glassware (except containers) establishments were \$1.24 and that straight-time average hourly earnings below 90 cents were received by 9 percent of all the workers. It is important to note, however, that the above distributions should be evaluated in the light of the limitations referred to at the hearing by a representative from the Bureau of Labor Statistics. The major limitation of this table results from the fact that in adjusting the actual percentage distributions existing in January 1947 to reflect approximately the two wage increases negotiated since that date, the assumption was made by the Bureau of Labor Statistics that the wages of all plant workers—whether employed in union plants or not—were increased by a flat 8 cents an hour in August 1947 and a flat 10 cents an hour in August 1948, resulting in a total increase for all workers in the industry of 18 cents an hour. Actually, the large, low-wage group of approximately 28,500 unskilled and semi-skilled workers employed in the miscellaneous divisions in all plants, which accounts for 86 percent of the 33,000 organized workers currently employed in the industry, received a wage increase of only 6 cents an hour in August 1947. Accordingly, an upward wage adjustment to the extent of 16 cents an hour instead of 18 cents an hour would have reflected more accurately the measure of the total wage increase given the vast majority of the workers in the industry from January 1947 to September 1948. Subsequent to the hearing the Bureau of Labor Statistics revised the wage distribution table on the basis of the 16 cents an hour increase actually received.

Supplemental information submitted by representatives of the union and in-

dustry associations indicated employment of about 1,300–1,400 workers in occupations to which the 83½ cents minimum is applicable, and that from 60 percent to 80 percent of this group receive exactly 83½ cents an hour. Relating these estimates to the total estimated labor force in hand plants indicates that approximately 7 percent of workers in hand plants are employed at 83½ cents an hour.

The evidence submitted by the Union and by industry representatives, together with statistical data on employment in the industry, supports a finding that 83½ cents an hour is the prevailing minimum wage in the industry.

The evidence in the record also established that there exists an industry practice to hire beginners in certain operations at a wage 5 cents below the contract minima. The copies of the collective bargaining agreements in evidence also confirm the existence of such differential. Such industry practice should, therefore, be given effect in a determination of the prevailing minimum wage.

Amendment of determination. After consideration of the entire record of this proceeding, the prevailing minimum wage determination for the flint glass industry is hereby amended to read as follows:

§ 202.18 *Pressed and blown glass and glassware industry*—(a) *Definition.* The pressed and blown glass and glassware industry, formerly known as the flint glass industry, is defined as that industry which manufactures pressed and blown glass and glassware, including, but not limited to, tumblers and other glass table and ornamental ware; glass blanks for electric light bulbs and electronic apparatus; glass shades and reflectors, and other illuminating glassware; smokers' glass accessories; glass rod and tubing, chemical and laboratory glassware, and other technical, scientific, and industrial pressed and blown glassware; glass oven, cooking, and kitchen ware; glass brick; glass insulators; glass parts for vacuum ware; fiberglass and foamglass products except tapes and other woven fabrics; and goggle lenses, nonprescription lenses and signal lenses.

Expressly excluded from the scope of the definition are window, plate and rolled glass; commercial glass containers (including prescription ware) for commercial packing and bottling, and for home canning; and chemical and other laboratory apparatus in which glass is assembled in combination with other materials.

(b) *Minimum wage.* The minimum wage for employees engaged in the performance of contracts with agencies of the United States subject to the provisions of the Walsh-Healey Public Contracts Act for the manufacture or supply of products of the pressed and blown glass and glassware industry shall be 83½ cents an hour arrived at either upon a time or piece-work basis; except that beginners as herein defined may be employed during a learning period of 60 calendar days at 78½ cents an hour unless experienced workers in the same plant and occupation are paid on a piece rate basis, in which case the beginners must be paid the same piece rates paid

to experienced workers and earnings based upon those piece rates, if such earnings are in excess of 78½ cents an hour. A beginner for the purpose of this determination, is a person who has not been employed in the same plant, or in the same department of another plant in the same branch of the industry, for as long as 60 calendar days and who is not a journeyman, skilled craftsman, apprentice or an employee in the furnace room or hot metal department. Any previous employment as defined above must be subtracted from the 60-day learning period.

(c) *Effective date.* This determination shall be effective and the minimum wage hereby established shall apply to all contracts subject to the Public Contracts Act, bids for which are solicited or negotiations otherwise commenced on or after August 16, 1949.

(d) *Effect on other minimum rates.* Nothing in this determination shall affect any obligations for the payment of minimum wages that an employer may have under any law or agreement more favorable to employees than the requirements of this determination.

(49 Stat. 2036; 41 U. S. C. 35–45)

TITLE 43—PUBLIC LANDS: INTERIOR

Chapter I—Bureau of Land Management, Department of the Interior

Appendix—Public Land Orders

[Public Land Order 594]

ALASKA

EXCLUDING CERTAIN TRACTS OF LAND FROM CHUGACH AND TONGASS NATIONAL FORESTS AND RESTORING THEM FOR PURCHASE AS HOMESITES

By virtue of the authority vested in the President by the act of June 4, 1897, 30 Stat. 11, 36 (16 U. S. C. sec. 473), and pursuant to Executive Order No. 9337 of April 24, 1943, it is ordered as follows:

The following-described tracts of public land in Alaska, occupied as homesites, and identified by surveys of which plats and field notes are on file in the Bureau of Land Management, Washington, D. C., are hereby excluded from the Chugach and Tongass National Forests in Alaska, and restored, subject to valid existing rights, for purchase as homesites under section 10 of the act of May 14, 1898, as amended by the act of May 26, 1934, 48 Stat. 809 (U. S. C. title 43, sec. 461):

CHUGACH NATIONAL FOREST

U. S. Survey No. 2524, lot 1, 1.91 acres; latitude 60°3'10" N., longitude 149°48' W. (Homesite No. 110, Slaughter Creek Group).

U. S. Survey No. 2526, lot 10, 4.67 acres; latitude 60°29'49" N., longitude 149°49'30" W. (Homesite No. 51, Cooper's Landing Group).

U. S. Survey No. 2527, lot 1, 3.35 acres; latitude 60°29'49" N., longitude 149°49'30" W. (Homesite No. 55, Cooper's Landing Group).

U. S. Survey No. 2527, lot 2, 4.97 acres; latitude 60°29'49" N., longitude 149°48' W. (Homesite No. 10, Cooper's Landing Group).
 U. S. Survey No. 2528, lot 23, 4.81 acres; latitude 60°28'23" N., longitude 149°21' W. (Homesite No. 80, Trall Lake Group).
 On south shore of Kenal Lake adjoining H. E. S. 224, 4.75 acres; latitude 60°29' N., longitude 149°45' W. (Homesite No. 109).

TONGASS NATIONAL FOREST

U. S. Survey No. 2386, lot K, 1.92 acres; latitude 58°21'49" N., longitude 134°37'07" W. (Homesite No. 486, Pederson Hill Group).
 U. S. Survey No. 2402, lot L, 1.24 acres; latitude 55°18' N., longitude 131°32' W. (Homesite No. 559, Mountain Point Group).
 U. S. Survey No. 2402, lot 53, 1.33 acres; latitude 55°18' N., longitude 131°32' W. (Homesite No. 844, Mountain Point Group).
 U. S. Survey No. 2403, lot 86, 0.87 acre; latitude 55°19'20" N., longitude 131°30' W. (Homesite No. 992, Herring Bay Group).
 U. S. Survey No. 2452, lot 15, 3.74 acres; latitude 57°47'04" N., longitude 135°14' W. (Homesite No. 823, West Tenakee Group).
 U. S. Survey No. 2554, lot I, 4.26 acres; latitude 55°28' N., longitude 131°47' W. (Homesite No. 589, Clover Pass Group).
 U. S. Survey No. 2589, lot 15, 3.24 acres; latitude 56°23'38" N., longitude 132°21' W. (Homesite No. 794, Wrangell Highway, Section 2).
 U. S. Survey No. 2603, lot 16, 3.20 acres; latitude 55°25'42" N., longitude 131°50' W. (Homesite No. 866, Point Higgins Group).
 U. S. Survey No. 2604, lot 15, 3.52 acres; latitude 55°25'42" N., longitude 131°50' W. (Homesite No. 264, Point Higgins Group).
 U. S. Survey No. 2604, lot 19, 2.70 acres; latitude 55°25'42" N., longitude 131°50' W. (Homesite No. 696, Point Higgins Group, Group B).
 U. S. Survey No. 2616, lot 12, 1.25 acres; latitude 55°57'47" N., longitude 133°47'51" W. (Homesite No. 647, Fisherman's Harbor Group).
 U. S. Survey No. 2670, lot 4, 0.77 acre; latitude 58°22'37" N., longitude 134°38'30" W. (Homesite No. 770, Fritz Cave Group).
 U. S. Survey No. 2678, lot 1, 0.32 acre; latitude 55°25' N., longitude 131°45'30" W. (Homesite No. 886, Mud Bay Group).
 U. S. Survey No. 2741, lot 3, 0.62 acre; latitude 58°23' N., longitude 134°38'07" W. (Homesite No. 888, Auke Lake Group).
 T. 58 S., R. 79 E., Copper River Meridian, sec. 29, in lot 7, 4.87 acres. (Homesite No. 698).

TITLE 47—TELECOMMUNICATION

Chapter I—Federal Communications Commission

PART 1—PRACTICE AND PROCEDURE

PART 3—RADIO BROADCAST SERVICES

TRANSFER AND ASSIGNMENT APPLICATIONS

In the matter of adoption of proposed form for use in connection with the filing of certain transfer and assignment applications. Amendment of § 1.321 of Part 1, and §§ 3.223, 3.523, 3.623, and 3.723 of Part 3 of the Commission's rules and regulations.

At a session of the Federal Communications Commission held at its offices in Washington, D. C., on the 6th day of July 1949;

The Commission having under consideration the matter of the adoption of a new Form (316) to be used in connection with the filing of certain types of transfer and assignment applications and the matter of amending §§ 1.321, 3.223, 3.523, 3.623 and 3.723 of its rules and regulations so as to include appropriate references therein to the form to be adopted; and

It appearing, that, although certain types of transfer and assignment applications relate to matters *pro forma* in nature, there are available to applicants for use in connection with such applications only Forms 314 (Assignment of License) and 315 (Transfer of Control) which forms require information above and beyond that pertinent to *pro forma* transfers and assignments; and, it appearing that it would conduce to the public interest and convenience and to the more prompt dispatch of the Commission's business to adopt a new Form (316) requiring the submission of only that information directly pertinent to such applications and that, further, the adoption of the form and amendments herein referred to are procedural in nature and not within the requirements of section 4 (a) of the Administrative Procedure Act; and

It further appearing, that FCC Forms 328 and 329 as set forth in § 1.321 (b) are obsolete and that accordingly reference to such forms should be deleted; and

It further appearing, that authority for the adoption of the new form and the amendments herein proposed is contained in sections 4 (1), 303 (r), 309, 310 and 319 of the Communications Act of 1934, as amended;

It is ordered, That the attached Form 316 "Application for Consent to Assignment of Radio Broadcast Station Construction Permit or License or Transfer of Control of Corporation holding Radio Broadcast Station Construction Permit or License (Short Form)"¹ be adopted; and

It is further ordered, That § 1.321 of Part 1 of the Commission's rules and regulations be amended to read in its entirety as follows:

§ 1.321 *Application for voluntary assignment or transfer of control; broadcast.* (a) Applications for consent to the assignment of construction permit or license for an AM, FM, television or other broadcast station or for consent to the transfer of control of a corporation holding such a construction permit or license shall be filed with the Commission on FCC Form No. 314 (Assignment of License), FCC Form No. 315 (Transfer of Control), or FCC Form 316 (Short Form). Such applications shall be filed with the Commission at least 60 days prior to contemplated effective date of assignment of transfer of control.

(b) *Pro forma* assignment or transfer applications shall be filed on FCC Form 316. Such cases are defined as cases in which:

(1) There is an assignment from an individual or individuals (including partnerships) to a corporation owned and controlled by such individuals or part-

nerships without any substantial change in their relative interests;

(2) There is an assignment from a corporation to its individual stockholders without effecting any substantial change in the disposition of their interests;

(3) There is an assignment or transfer by which certain partners or stockholders retire but no new ones are brought in, provided that the interest transferred is not a controlling one;

(4) There is a corporate reorganization which involves no substantial change in the beneficial ownership of the corporation;

(5) There is an involuntary transfer to an Executor, Administrator or other court appointed officer caused by death or legal disability except that this form does not cover assignments (or transfers) from the Executor, Administrator or other court appointed officers to the ultimate beneficiary;

(6) There is an assignment or transfer from a corporation to a wholly owned subsidiary thereof or vice versa, or where there is an assignment from a corporation to a corporation owned or controlled by the assignor stockholders without substantial change in their interests.

It is further ordered, That § 3.223 of Part 3 of the Commission's rules and regulations be amended to read in its entirety as follows:

§ 3.223 *Assignment or transfer of control—(a) Voluntary.* Application for consent to voluntary assignment of an FM broadcast station construction permit or license or for consent to voluntary transfer of control of a corporation holding an FM broadcast station construction permit or license shall be filed with the Commission on Form FCC No. 314 (Assignment of License), Form FCC No. 315 (Transfer of Control) or Form FCC No. 316 (Short Form) at least 60 days prior to the contemplated effective date of assignment or transfer of control.

(b) *Pro forma.* Assignment or transfer applications shall be filed on FCC Form 316 where:

(1) There is an assignment from an individual or individuals (including partnerships) to a corporation owned and controlled by such individuals or partnerships without any substantial change in their relative interests;

(2) There is an assignment from a corporation to its individual stockholders without effecting any substantial change in the disposition of their interests;

(3) There is an assignment or transfer by which certain partners or stockholders retire but no new ones are brought in, provided that the interest transferred is not a controlling one;

(4) There is a corporate reorganization which involves no substantial change in the beneficial ownership of the corporation;

(5) There is an involuntary transfer to an Executor, Administrator or other court appointed officer caused by death or legal disability except that this form does not cover assignments (or transfers) from the Executor, Administrator or other court appointed officers to the ultimate beneficiary;

(6) There is an assignment or transfer from a corporation to a wholly owned

¹ Filed as part of the original document.

subsidiary thereof or vice versa, or where there is an assignment from a corporation to a corporation owned or controlled by the assignor stockholders without substantial change in their interests.

(c) *Involuntary.* In the event of the death or legal disability of a permittee or licensee, or a member of a partnership, or a person directly or indirectly in control of a corporation, which is a permittee or licensee:

(1) The Commission shall be notified in writing promptly of the occurrence of such death or legal disability, and

(2) Within 30 days after the occurrence of such death or legal disability, application on Form FCC No. 316 shall be filed for consent to involuntary assignment of such FM broadcast station permit or license or for involuntary transfer of control of such corporation to a person or entity legally qualified to succeed to the foregoing interests under the laws of the place having jurisdiction over the estate involved.

It is further ordered, That § 3.523 of Part 3 of the Commission rules and regulations be amended to read in its entirety as follows:

§ 3.523 *Assignment or transfer of control.* Application for consent to assignment of a noncommercial educational FM construction permit or license or for consent to voluntary transfer of control of a corporation holding a noncommercial educational FM construction permit or license shall be filed with the Commission on Form FCC No. 314 (Assignment of License), Form FCC No. 315 (Transfer of Control) or Form FCC No. 316 (Short Form) at least 60 days prior to the contemplated effective date of assignment or transfer of control.

(b) *Pro forma* assignment or transfer applications shall be filed on FCC Form 316. Such cases are defined as cases in which:

(1) There is an assignment from an individual or individuals (including partnerships) to a corporation owned and controlled by such individuals or partnerships without any substantial change in their relative interests;

(2) There is an assignment from a corporation to its individual stockholders without effecting any substantial change in the disposition of their interests;

(3) There is an assignment or transfer by which certain partners or stockholders retire but no new ones are brought in, provided that the interest transferred is not a controlling one;

(4) There is a corporate reorganization which involves no substantial change in the beneficial ownership of the corporation;

(5) There is an involuntary transfer to an Executor, Administrator or other court appointed officer caused by death or legal disability except that this form does not cover assignments (or transfers) from the Executor, Administrator or other court appointed officers to the ultimate beneficiary;

(6) There is an assignment or transfer from a corporation to a wholly owned subsidiary thereof or vice versa, or where there is an assignment from a corporation to a corporation owned or controlled by the assignor stockholders without substantial change in their interests.

It is further ordered, That § 3.623 of Part 3 of the Commission rules and regulations be amended to read in its entirety as follows:

§ 3.623 *Assignment or transfer of control.*—(a) *Voluntary.* Application for consent to voluntary assignment of a television station construction permit or license or for consent to voluntary transfer of control of a corporation permit or license or for consent to voluntary transfer of control of a corporation holding a television station construction permit or license shall be filed with the Commission on Form FCC No. 314 (Assignment of License), Form FCC No. 315 (Transfer of Control) or Form FCC No. 316 (Short Form) at least 60 days prior to the contemplated effective date of assignment or transfer of control.

(b) *Pro forma.* Assignment or transfer application shall be filed on FCC Form 316 where:

(1) There is an assignment from an individual or individuals (including partnerships) to a corporation owned and controlled by such individuals or partnerships without any substantial change in their relative interests;

(2) There is an assignment from a corporation to its individual stockholders without effecting any substantial change in the disposition of their interests;

(3) There is an assignment or transfer by which certain partners or stockholders retire but no new ones are brought in, provided that the interest transferred is not a controlling one;

(4) There is a corporate reorganization which involves no substantial change in the beneficial ownership of the corporation;

(5) There is an involuntary transfer to an Executor, Administrator or other court appointed officer caused by death or legal disability except that this form does not cover assignments (or transfers) from the Executor, Administrator or other court appointed officers to the ultimate beneficiary;

(6) There is an assignment or transfer from a corporation to a wholly owned subsidiary thereof or vice versa, or where there is an assignment from a corporation to a corporation owned or controlled by the assignor stockholders without substantial change in their interests.

(c) *Involuntary.* In the event of the death or legal disability of a permittee or licensee, or a member of a partnership, or a person directly or indirectly in control of a corporation, which is a permittee or licensee:

(1) The Commission shall be notified in writing promptly of the occurrence of such death or legal disability, and (2) within thirty days after the occurrence of such death or legal disability, application on Form FCC No. 316 shall be filed for consent to involuntary transfer of control of such corporation to a person or entity qualified to succeed to the foregoing interests under the laws of the place having jurisdiction over the estate involved.

It is further ordered, That § 3.723 of Part 3 of the Commission's rules and regulations be amended to read in its entirety as follows:

§ 3.723 *Assignment or transfer of control.*—(a) *Voluntary.* Application for

consent to voluntary assignment of an international station construction permit or license or for consent to voluntary transfer of control of a corporation holding an international station construction permit or license shall be filed with the Commission on Form FCC No. 314 (Assignment of License), Form FCC No. 315 (Transfer of Control) or Form FCC No. 316 (Short Form) at least 60 days prior to the contemplated effective date of assignment or transfer of control.

(b) *Pro forma.* Assignment or transfer applications shall be filed on FCC Form 316 where:

(1) There is an assignment from an individual or individuals (including partnerships) to a corporation owned and controlled by such individuals or partnerships without any substantial change in their relative interests;

(2) There is an assignment from a corporation to its individual stockholders without effecting any substantial change in the disposition of their interests;

(3) There is an assignment or transfer by which certain partners or stockholders retire but no new ones are brought in, provided that the interest transferred is not a controlling one;

(4) There is a corporate reorganization which involves no substantial change in the beneficial ownership of the corporation;

(5) There is an involuntary transfer to an Executor, Administrator or other court appointed officer caused by death or legal disability except that this form does not cover assignments (or transfers) from the Executor, Administrator or other court appointed officers to the ultimate beneficiary;

(6) There is an assignment or transfer from a corporation to a wholly owned subsidiary thereof or vice versa, or where there is an assignment from a corporation to a corporation owned or controlled by the assignor stockholders without substantial change in their interests.

(c) *Involuntary.* In the event of the death or legal disability of a permittee or licensee, or a member of a partnership, or a person directly or indirectly in control of a corporation, which is a permittee or licensee:

(1) The Commission shall be notified in writing promptly of the occurrence of such death or legal disability, and

(2) Within thirty days after the occurrence of such death or legal disability, application on Form FCC No. 316 shall be filed for consent to involuntary assignment of such international station permit or license or for involuntary transfer of control of such corporation to a person or entity legally qualified to succeed to the foregoing interests under the laws of the place having jurisdiction over the estate involved.

PROPOSED RULE MAKING

DEPARTMENT OF AGRICULTURE

Production and Marketing Administration

[7 CFR, Part 991]

MILK IN ROCKFORD-FREEPORT, ILLINOIS, MILK MARKETING AREA

DECISION WITH RESPECT TO PROPOSED MARKETING AGREEMENT AND PROPOSED ORDER REGULATING HANDLING

Pursuant to Public Act No. 10, 73d Congress (May 12, 1933) as amended and as reenacted and amended by the Agricultural Marketing Agreement Act of 1937, as amended (hereinafter referred to as the "act"), and the rules of practice and procedure, as amended, governing proceedings to formulate marketing agreements and orders (7 CFR, Supps. 900.1 et seq., 13 F. R. 8585), a public hearing was held at Rockford, Illinois, during the period June 2-9, 1948, upon a proposed marketing agreement and a proposed order regulating the handling of milk in the Rockford-Freeport, Illinois, milk marketing area.

The material issues presented on the record of this hearing were concerned with:

- (a) The need for regulation;
- (b) The extent to which interstate commerce is involved or affected; and
- (c) The provisions to be included in an order, if justified. The evidence on this issue involved:
 - (1) The extent of the marketing area;
 - (2) The definition of "producer", "handler", "approved plant", and other terms;
 - (3) The classification of milk and milk products;
 - (4) Allocation of classified skim milk and butterfat between receipts from producers and from other sources;
 - (5) The determination and level of class prices;
 - (6) Payments to producers;
 - (7) The applicability of provisions to milk regulated under other Federal orders;
 - (8) The amount of administrative assessments;
 - (9) The amount of deductions for marketing services; and
 - (10) The administrative provisions common to all orders.

Upon the basis of the evidence introduced at such hearing and the record thereof, the Assistant Administrator, Production and Marketing Administration, on March 22, 1949, filed with the Hearing Clerk, United States Department of Agriculture, his recommended decision in this proceeding. The notice of such recommended decision and of opportunity to file written exceptions thereto was published in the FEDERAL REGISTER on March 25, 1949 (14 F. R. 1356).

Rulings on exceptions. Exceptions to the recommended decision were filed on behalf of interested parties. Each of such exceptions was carefully considered in arriving at the findings and conclusions appearing in this decision.

Rulings on some of the exceptions appear herein in the findings and conclusions with respect to the particular issue to which the exception refers. Otherwise, to the extent that the findings and conclusions contained herein are at variance with exceptions pertaining thereto, such exceptions are denied.

The exceptions received from Rockford handlers alleged that certain developments had taken place since the hearing which should be considered in arriving at a decision on the issues and requested that the hearing be reopened in order that the facts concerning these developments might be placed in the record. A review of the record of hearing indicates that the developments alleged were either shown on the record or were clearly predictable from the evidence in the record. The principal developments alleged were concerned with one large handler changing his operations for the marketing area so that they are under the regulation of the Chicago milk order. This handler testified at the hearing that he intended to make this change. From his testimony and other facts in the record, the economic effects of such a move could be foreseen and were considered in arriving at this decision. Other alleged developments appear to be continuations of conditions shown on the record. It is, therefore, concluded that no useful purpose would be served by reopening the hearing and the request is denied.

Findings and conclusions. Upon the basis of the evidence adduced at such hearing, it is hereby found and concluded that:

- (a) Marketing conditions in the Rockford-Freeport area justify the issuance of an order.

The milksheds of Rockford and Freeport are within the inner reaches—Zones 2 to 5—of the Chicago milkshed where buyers in the local trade and buyers in the overshadowing Chicago trade are in close competition. By contract or oral agreement the producer associations and the handlers negotiate prices for association milk. These prices apply to a use classification of the milk that was adopted some years ago. It differs significantly from the classification scheme employed in the Chicago milkshed under Federal Order No. 41. The chief difference lies in the definition and determination of Class I milk. In effect, the Chicago plan would classify a larger proportion of producers' milk in the top price class than does the method followed by Rockford and Freeport handlers.

Since the lifting of war-time price control measures, class prices have equalled those currently paid for Chicago approved milk by handlers under Order 41 who operate in and around the milk shed of Rockford and Freeport. These prices have been at the Chicago Zone I (70-mile zone) level. Since September 1947, Rockford handlers have added an 8¢ premium on most of their receipts to meet premiums paid by competitive Chi-

cago plants. With such class prices the Rockford association during the period January-April 1948 made returns to their producers approximately equal to or a few cents above the Chicago 70-mile zone blended price. During the same period the returns to member producers of the Freeport association were a few cents under the Chicago 70-mile zone blended price. Prior to January 1948, returns to members of both associations were generally below the Chicago 70-mile zone blended price.

With the exception of one handler, Rockford and Freeport handlers purchase through the associations all milk received from producers. This handler is the largest Rockford operator who handles approximately 45% of local Class I and Class II business. In 1946 this handler cancelled his full-supply contract with the Rockford producers association on the grounds that the association was failing to provide him with enough milk for his business. While continuing to purchase association milk, the handler recruited a group of other producers, which by April 1948 numbered 70, or 16.5% of all Rockford approved producers. These producers have been paid the Chicago 70-mile blend price, plus whatever premiums Chicago buyers in the territory were paying. This handler has more recently declared his intention to cease handling milk for his Rockford Class I and Class II trade in his Rockford plant, and to use for this trade milk received and processed in a Chicago approved plant operated by him in a neighboring town. Handlers cite these circumstances in challenging the need for regulation and ask what more could be justified than class prices and producer returns equal to those of the regulated Chicago market. This challenge fails to consider supplies of producer milk in relation to need.

As matters stand, the Rockford market is in short supply of approved milk. The producers cooperative association has attempted to augment supplies by enlarging its membership as well as by encouraging higher production per member. Its efforts have been, for the most part, unavailing. In April 1948 it had 28 fewer members than at the close of 1945. In 1947 it lost 42 old members and gained 22 new members. Of the 42 who quit the association, 18 transferred to Chicago approved plants. Through April 1948 it had acquired 6 new member producers, but had lost 12 old producers, 5 of whom became Chicago producers. Even the accession of non-member producers seems not to have raised supplies to the full level of the expanding needs of the trade. The handler who turned to non-member producers for additional supplies testified that in the last three or four years available supply of Rockford approved producer milk has failed to keep pace with expanding needs of the trade.

It is clear from the record that the area as a whole has, since the war period, suffered from undersupply of locally in-

spected and approved milk. This supply condition has been associated with great expansion, in the production region of this marketing area, in demand of other markets for Grade "A" milk. The Chicago area trade, in particular, has in recent years drawn increasing quantities of Grade "A" milk from the region of this marketing area. Indeed, the proximity of Chicago handlers to this marketing area, due to great expansion in the demand for Chicago approved milk, has since the war period made the level of prices for Chicago approved milk the practical test of the adequacy and fairness of producer prices in this area. This does not mean that local producer prices (or returns) must always equal producer prices for Chicago approved milk. On the contrary, it implies that when the local market is relatively undersupplied, producer prices (or returns) should rise substantially above those of the alternative market. It has appeared from indications above cited that Rockford and Freeport producer prices have not, even up to the end of the period observed, very well measured up to such test.

The record shows considerably higher proportionate Class I utilization and of combined Class I and II utilization, during the early months of 1948, in the Rockford area plants than in Chicago approved plants under Order 41, with approximately equal producer returns. From this it is clear that Rockford and Freeport handlers, under their class price arrangements with the producers' association, paid less to the associations for milk used in their Grade "A" milk and cream trade than Chicago handlers were paying to Chicago producers for milk similarly used. Had they really paid as much, association returns to producers would surely have been substantially above minimum producer prices at competitive Chicago plants.

The association could not augment its supplies without inevitably driving its returns to producers below the Chicago producer price; for, additional supply, though no greater than required for a comfortable margin, would naturally lower the proportionate use in Class I. Such classification and pricing has not reflected in prices to producers the supply and demand condition in the area. As a method of determining producer prices it cannot be relied upon to induce a supply in balance with needs of the market.

Unsatisfactory producer prices have been more a matter of classification than of the class prices themselves. In both parts of the proposed marketing area, bargaining with respect to class prices has been more or less obstructed by the vagaries of the classification system. Another part of this report deals in particular with the question of adequate classification for the area. Here it only needs to be noted that the scheme employed in the area has proven to be inadequate as a basis for the determination of producer prices. Proof of its inadequacy lies mainly in the fact that it fails to capture for the top price category all of the milk actually used by handlers for their trade in fresh milk and milk drinks. This is due in part to definition, in part

to the method of classification, and in part, to the method of accounting for class usage. First, by definition, Class I is unduly limited in that it is not specifically made to include all fluid usage whether in whole milk or skim and also the residual or accounting items: excess shrinkage and unaccounted for milk. Class II includes beverage uses of skim which are more appropriately included in Class I. Second, computation of utilization of receipts by classes is not based on records showing actual quantities of milk, butterfat, and skim used in each class. Rather it is done by an oversimplified conversion method that entirely omits any reconciliation of quantities actually used in each class of utilization with total disposition and receipts. Such computation is bound in most cases to inflate classification in lower classes at the expense of Class I. Besides, the method is quite lacking in proof of accuracy and true representation. Third, with this method of accounting for class usage handlers avoid the burden of proof. To allow representatives of producers to check certain records is no substitute for a method of accounting for class usage that is not only supported by all relevant records and accounts of handlers, but also buttressed by class definitions that place in Class I all milk inadequately accounted for in lower class usage. If the Class I price is to apply to all usage properly defined as Class I, then handlers must assume the burden of proof of utilization. This follows from the evident necessity of supporting claimed utilization by adequate accounting for all milk handled. Judged with reference to these features, the classification system of the area fails to measure up to requirements. It is too ineffectual to serve as a basis for class prices that are, under present market conditions, essential for satisfactory producer returns.

(b) The handling of milk in the Rockford-Freeport, Illinois, marketing area is in the current of interstate commerce and directly burdens, obstructs and affects interstate commerce in milk and its products.

Substantial interstate movement occurs with respect to milk produced for the Rockford-Freeport marketing area, and with respect to milk products produced therefrom, and in addition, there is a close interrelationship between the handling of such milk and that of other milk that moves in interstate commerce. The cities of Rockford and Freeport are in Illinois, within a few miles of the State of Wisconsin, and within the area from which the Chicago marketing area draws its supplies. Milk of a Wisconsin producer is approved by Rockford health authorities and is delivered to a Rockford plant. Cream from Wisconsin plants has during the past year been received by Rockford handlers as an approved emergency supply. Chicago approved milk from plants with Wisconsin producers is distributed in Freeport and in portions of the proposed marketing area beyond the city limits of Rockford and Freeport.

Milk of producers inspected for the Rockford - Freeport market is distributed frequently in the current of interstate

commerce. One Rockford handler is currently packaging such milk in paper cartons for distribution by a handler in Beloit, Wisconsin. Milk and ice cream from Rockford and Freeport handlers was shown to be distributed in Wisconsin communities. Supplies of inspected milk, when surplus to local needs, are disposed of at a wide variety of plants from which manufactured products and, in the case of one plant, fluid milk, are widely distributed in interstate commerce.

Producers of the Rockford-Freeport marketing area are interspersed with those supplying Chicago approved plants, some of which are located in Wisconsin and many of which receive milk from Wisconsin patrons. Rockford-Freeport producers are also interspersed with dairy farmers supplying manufacturing plants in Illinois and Wisconsin from which dairy products are distributed widely without regard to state lines. Shifting of producers among the Rockford-Freeport plants, Chicago approved plants, and manufacturing plants occurs frequently. In addition there is active procurement in the area by other plants for inspected milk supplies, some of which are for markets outside of Illinois. These interrelationships have a substantial effect upon the flow of milk from one market to another, and hence upon the volume of milk which crosses state lines. Price distortions which interrupt or interfere with the economical disposition of milk in this area burden, obstruct and affect interstate commerce in milk and its products.

(c) From the evidence it is concluded that the proposed marketing agreement and order hereinafter set forth meet the needs of the Rockford-Freeport market and will tend to effectuate the declared policy of the act. The following findings and conclusions are made with respect to the various provisions of the marketing agreement and order:

(1) *Extent of the marketing area.* The marketing area should be defined to include the City of Rockford with six adjacent or nearby townships in Winnebago County and the City of Freeport together with four townships in Stephenson County, all in the State of Illinois. Rockford and Freeport have almost identical sanitary and health requirements with enforcement on a quite comparable basis. The production areas recognized by the health authorities of the two cities overlap. Freeport authorities are currently recognizing Rockford inspection by permitting sale of Grade "A" milk received at and packaged in a Rockford plant. The proposed marketing area, while not contiguous, includes the principal urban areas in which Rockford and Freeport inspected milk is sold. The townships included are adjacent or near to the two cities and have considerable urban population regularly served by handlers of the two cities.

The record does not indicate that any useful purpose would be served by extending the marketing area to include the entire area of Winnebago and Stephenson Counties as originally proposed by producers. While Rockford and Freeport inspected milk is sold throughout these counties, most of the other milk distrib-

uted in these counties (outside the proposed marketing area) is by handlers under regulation of the Chicago order, rather than from sources that will be free of regulation. The extension of the marketing area would not provide sufficient additional protection to handlers or producers to warrant including the whole of both counties.

(2) *Definitions.* The term "producer" should be defined to include those dairy farmers whose milk is regularly received directly from the farm where produced at a plant from which routes distributing fluid milk are operated in the marketing area. Those dairy farmers included thereby should be divided into two groups: (a) those approved by appropriate health authorities of the marketing area, or by the State of Illinois, for the production of milk to be distributed as Grade "A" milk in the marketing area, whose milk is regularly received at a plant from which Grade "A" milk is distributed in the marketing area, and (b) those whose milk is regularly delivered to a plant distributing non-Grade "A" milk in the marketing area.

Only Grade "A" milk approved by the health authorities of the municipalities may be distributed in the Cities of Rockford and Freeport. In other parts of the marketing area there are distributed in addition to these supplies, both Grade "A" milk inspected by the State of Illinois under requirements very similar to those of the municipalities, and milk that is not Grade "A". By the definitions of "producer" and "handler", it is intended in this decision to place under regulation all milk distributed in fluid form in the marketing area. The recommended decision in these proceedings had proposed to regulate only that eligible for distribution as Grade "A" milk. The change is made upon reconsideration of the record in the light of the exceptions received. Both producers and handlers protested in their exceptions to the failure of the recommended decision to regulate non-Grade "A" milk. That decision was based to a considerable extent upon the small volume of such milk distributed in the proposed marketing area at the time of the hearing. Distribution of non-Grade "A" milk was shown on the record to have been a factor that at times in the past seriously affected the marketing of all milk in the area, and the potentialities for a recurrence of such a situation are clearly set forth in the record. From the evidence in the record, it is concluded that stable and orderly marketing of milk in the marketing area requires that the handling of both Grade "A" and non-Grade "A" milk should be regulated.

Handlers allege that the distribution of non-Grade "A" milk had increased since the hearing and request a reopening of the hearing in order that additional facts may be placed on the record. The record of volumes distributed since the hearing that are alleged by handlers would not contribute to a decision on methods of regulation for such milk; hence the request to reopen the hearing is denied.

Dairy farmers who distribute their own production and do not purchase milk from other producers should be excluded from the definition of producers. Nor-

mally such persons deliver to the regulated plants of other handlers only milk which is in excess of their own needs, and they should not, therefore, share with other producers in the proceeds of the higher priced utilization of regulated plants.

The term "handler" should be defined to include operators of plants from which fluid milk is distributed directly into the marketing area; it should also include cooperative associations with respect to milk of producers which such cooperative associations divert at times to manufacturing plants when not needed for fluid distribution. The substantive provisions of the order regulate activities of handlers; hence it is necessary that a definition of the term be included in the order. The proposed definition will include all persons responsible for reporting receipts and utilization of producer milk and for making payments for such milk.

The distinction made between the producers from whom Grade "A" supplies of the marketing area are received and those producing the non-Grade "A" supplies makes desirable a similar distinction between the plants distributing Grade "A" milk and other plants. The term "approved plant" should be defined to include any milk plant from which Grade "A" milk in fluid form is distributed in the marketing area. There is at least one plant in the marketing area where the record showed a dual operation at which physical segregation (in separate parts of the same plant) is required between Grade "A" and non-Grade "A" operations, the latter not concerned with fluid distribution in the marketing area. It is not necessary to bring such a non-Grade "A" operator under regulation for protection of producer interests in determining the classification of his milk. The definition of approved plant should exclude any portion of the plant or facilities used to process milk or milk products which health authorities require to be kept physically separate from the portion in which Grade "A" milk is handled. A definition of an approved plant is included to clarify the language of producer and handler definitions and of other provisions of the order. There are no present or prospective receiving station operations; therefore, the definition of approved plant may be restricted to those plants actually distributing Grade "A" milk in the marketing area.

The term "producer-handler" should include any person who produces milk and operates a plant from which a route is operated in the marketing area, but who receives no milk from producers. It is concluded that such persons should be exempt from the regulatory provisions of the order except for making reports to the market administrator at such time and in such manner as the market administrator may require. Producer-handlers (by definition) do not purchase or receive milk from producers; they are for this reason not subject to the pricing provision of the order which applies solely to the sale of milk by producers to handlers. However, in order that the market administrator may inform him-

self as to their status in relation to the regulation, it is necessary for him to receive reports from producer-handlers from time to time.

The term "other source milk" should include all receipts of skim milk and butterfat at a regulated plant, except as contained in producer milk, in receipts from other handlers, in certain receipts from handlers under other orders as discussed elsewhere in this decision, and in non-fluid milk products received from non-handlers and disposed of in the same form. Definition of other source milk will simplify the language of other sections of the order. It is proposed under other sections that receipts of other source milk be included in the total classified use of a regulated plant and then be deducted in arriving at the use classification to be allocated to producer milk. However, it does not appear necessary that non-fluid milk products received from sources other than handlers should enter these calculations, if disposed of in the same form as when received. Therefore, such non-fluid milk products are excluded from the term "other source milk". This serves the purpose sought by a handler proposal to define "milk products". A handler proposal to define "emergency milk" for the purpose of an allocation treatment different from that of "other source milk" should not be adopted. The purpose of this proposal appears to be to require producer milk to share classification ratably with such outside purchases as health authorities permit to be labelled Grade "A" when supplies of producer milk available to a handler with an approved plant are less than his Class I and Class II needs. It appears that the City of Rockford, in recent years, has been short of producer milk for Class I and Class II needs in the short season and the health authorities now allow emergency supplies to enter the city when needed in fall months. At the same time that there was a shortage at Rockford, there was a surplus in the short season on the Freeport market and no indication was given that these supplies would not be acceptable to Rockford authorities for use in that city. In support of the proposed definition of "emergency milk" handlers contended that they should not be charged the highest classification for producer milk when their receipts of producer milk are less than Class I and Class II uses, because imported supplies acceptable to health authorities usually were secured at premium prices. This, however, would be accomplished by reducing returns to local producers. To the extent that milk approved for one portion of the marketing area will meet the need of another part, the desired end can be achieved with accompanying benefits to producers by transfers of milk among handlers without reducing returns to producers. Moreover, producers should receive the higher classification in order that returns to producers will be maintained at a level which will encourage production by approved producers.

In order that language in other sections of the order may be shortened, definitions of "act", "Secretary", "Department", "person", "cooperative asso-

ciation", "delivery period", "unapproved plant" and "producer milk" should be included. These terms are common to Federal milk marketing orders issued pursuant to the act. A definition of "route" is also included as an auxiliary to the definitions of "approved plant" and "handler".

(3) *Classification of milk.* The order should provide for the separate classification of skim milk and butterfat. Such a system of classification will provide equitable costs to handlers whose use of these components vary from each other, and will enable handlers to determine accurately their costs for milk used in each product. It will also provide producers with returns based upon the actual utilization of their milk. The present accounting methods in use by many handlers in the market do not accurately reflect to producers the actual use of skim milk and butterfat, in that milk equivalents of butterfat are used to determine Class II volume, and Class I volume in a residual amount. Under this system, volume of Class I milk is impaired to the extent that skim milk is used to standardize milk sold for fluid consumption. Skim milk and butterfat should be classified in three classes as follows:

Class I milk should include skim milk and butterfat which is disposed of in fluid form as milk, skim milk, buttermilk, flavored milk, or flavored milk drinks, and that not specifically accounted for otherwise;

Class II milk should include skim milk and butterfat which are disposed of, in fluid form, as cream, or cream mixtures of 6 percent or more butterfat (except ice cream mix) and eggnog;

Class III milk should include skim milk and butterfat which are used to produce all products other than those specified in Class I and Class II and in actual plant loss (but limited, with respect to butterfat and skim milk in producer milk, to not more than 2 percent of receipts of producer milk). Class III milk should also include skim milk marketed for livestock feed or dumped, if properly accounted for to the market administrator.

The items included in Class I and Class II milk are those required by the health authorities of the cities of the marketing area to be produced from Grade "A" milk. Further these items are those currently included within these classes under the accounting between handlers and the cooperative associations supplying them, except that buttermilk, flavored milk, and flavored milk drinks are now included in Class II milk instead of Class I milk. The physical characteristics, purposes, values and uses of these items are more nearly similar to those of fluid milk than to those of the products included in Class II milk. Accordingly, it is concluded that they should be included in Class I milk.

Fluid cream and cream mixtures are included as Class II. Under the accounting (skim milk and butterfat separately) and pricing plan herein recommended, results would not be significantly different if these products were included in Class I. Use of a separate class for cream will, however, permit separate consideration of prices as the need arises.

The inclusion in Class III milk of products other than those required by city health regulations to be from Grade "A" milk is amply justified by the conditions of the market. Class III milk is that which is in excess of the market needs for Class I and Class II milk. Use of this milk may be made only in manufactured milk products and the value of it is commensurate only with that of uninspected milk used in manufactured milk products. At present this classification is used for all milk delivered to Rockford and Freeport handlers beyond Class I and II needs. There are readily available outlets in the immediate area in which any surplus milk can be used for ice cream purposes, or for condensed products, which are usually considered to be high value outlets for manufacturing milk. The proposal of handlers to provide a fourth classification for butter, cheddar cheese, casein and skim milk sold for animal feed or dumped, should not be adopted, as the necessity for finding low value outlets for any volume of surplus milk, was not shown. The fact that route returns of Class I and Class II products may on occasion find their way into such products does not justify providing the class. The records indicate that the cooperatives supplying Rockford and Freeport have found outlets for surplus milk at prices equal to or above condensery values.

A shrinkage allowance on producer milk is necessary to reconcile milk accounted for as disposed of with that which is accounted for as received. This reconciliation should be made to the extent of two percent of producer receipts in Class III, as proposed by producers and currently in effect between Rockford handlers and the association supplying them. In order to protect the pricing scheme from excessive amounts of unaccounted for milk, losses in excess of 2 percent of producer receipts should be in Class I. Experience with the 2% allowance demonstrates that it has operated satisfactorily in the market. The handler proposal that the shrinkage allowance be set at three percent was not supported on the record by any testimony showing that past experience or efficient operation requires an allowance of this amount. No limits need be put on the amount of shrinkage in other source milk that may be allocated to Class III, since receipts of other source milk by means of the allocation provisions discussed elsewhere in this decision will be deducted from the lower class uses found in the plant. Since, when other source milk is present, shrinkage cannot be identified separately between producer milk and other source milk, provision is included to allocate the total shrinkage pro rata between producer milk and other source milk.

The order should require the handler who receives skim milk or butterfat to prove to the market administrator use in some class other than Class I, or to account to producers for such receipts as Class I milk. Such a provision insures to producers that their returns will not suffer because of inadequate accounting by the handler.

Under the order herein recommended, the classification of milk transferred or

diverted to another handler in the form of milk or cream may be determined by agreement between the handlers provided the receiving handler has use for an equivalent amount of milk in the class to which the transferred milk is assigned, after application of the allocation provisions with reference to other source milk. In this way producers generally will receive the full classification of their milk while at the same time a high degree of flexibility is afforded to handlers in transferring milk among themselves.

Any milk or skim milk transferred to a producer handler will be Class I milk and any cream transferred to a producer handler will be Class II milk. Producer handlers do not share their utilization with regular producers and normally buy milk and cream from other handlers only for Class I and Class II uses. By the method provided producer handlers may buy milk and cream at classifications consistent with the most likely use of the product and returns to producers generally are safeguarded against abuse.

Milk, skim milk or cream, transferred or diverted to an unapproved plant within one-hundred miles of the marketing area may be classified upon the basis agreed upon between the buyer and seller, provided the buyer maintains adequate books and records, and has actually used an equivalent amount of milk in the class named. Such transfers are normally of surplus milk to manufacturing plants which should not be required to replace regular receipts of such plants in any higher class uses of such plants. Transfers to unapproved plants at points beyond one-hundred miles should be classified as Class I if in the form of milk or skim milk, and as Class II if in the form of cream. A limitation of this kind is necessary because the market administrator must trace for audit purposes all movements of milk and cream which may later be reclassified into a lower value class. In the interest of reasonable administrative economy, limits must be set on shipments beyond which the classification is final. These limits should reasonably accommodate the marketing necessities of handlers. Within 100 miles of the Rockford-Freeport area, there are ample manufacturing facilities to absorb any surplus producer milk. Hence, there should be little occasion for milk to move more than 100 miles unless for Class I or Class II use because the transportation charges involved are such as to make uneconomical movement for manufacturing purposes at greater distances.

(4) *Allocation of classified milk.* When producer milk which is subject to the pricing provisions of the order, and other source milk are both received at a regulated plant, it is impossible to determine definitely upon the basis of usual accounting records the uses made of each. Producers, as defined herein, who regularly supply milk for the Class I and Class II needs of the market, should, in such cases, have prior claim on the higher class uses of milk by the regulated plant. Therefore, allocation provisions are included which allocate receipts of producer milk, with the exception of plant loss not in excess of 2 percent of receipts of such milk, to the highest classes for

which an equivalent amount of milk was used in the plant, and allocate receipts of other source milk to the lower classes for which an equivalent amount of milk was used in the plant.

(5) *Determination and level of prices.*
(a) Class prices should be based on prices paid for milk used for manufacturing purposes.

Historically, prices paid for milk used for fluid purposes have been closely related to prices paid for milk used for manufacturing purposes. Such relationships are quite pronounced in areas such as the one here under consideration, where milk is produced in relatively large quantities and where manufacturing plants serve as alternative outlets for milk production. Production and marketing of milk for each type of outlet is subject to many of the same economic factors. Since the market for most manufactured products is country-wide, prices of manufactured dairy products reflect to a large extent changes in general economic conditions affecting the supply and demand for milk. For these reasons fluid milk markets have used butter, powder and cheese prices, or the prices paid by condenseries, as a basis for establishing fluid milk prices. Differentials over these basic or manufacturing prices are needed to reflect the additional cost of meeting quality requirements in the production of market milk, and to furnish the necessary incentive to get such milk produced and delivered to points of consumption.

It is concluded that the basic price to be used in establishing Class I and Class II milk prices should be the price paid for milk of 3.5% butterfat delivered to 18 plants at which milk is manufactured into evaporated milk. Formulas based upon prices of butter and cheese and upon butter and nonfat dried milk solids should be used as alternatives. Similar basic price formulae are contained in the orders for Chicago and Suburban Chicago marketing area. It is important that a similar basis be used in the Rockford-Freeport area, and that changes in class prices for these areas occur simultaneously, since producers of the three areas are intermingled. For this reason the use of certain nearby Illinois condenseries as the list of evaporated plants, as advocated by handlers, should not be adopted. The butter-cheese alternative formula included is the so-called evaporated milk code price which also appears in the Chicago milk order. The butter-nonfat dry milk solids formula recommended uses generally accepted standards of yield of these products per hundred pounds 3.5 percent milk, and provided "make allowances" for both butter and nonfat dry milk solids. While the components of this formula vary from that included in the Chicago order, its use results in a price almost identical with that of the Chicago formula.

Handlers excepted to the butterfat-nonfat dry milk solids formula included in the recommended decision, claiming that its use as an alternative formula would result in their paying higher class prices than required of competing Chicago handlers under Order No. 41. The formula recommended results in prices

slightly less than those of the Chicago order, except for the months of March through June when the Chicago formula has a seasonal reduction of approximately 7.5 cents per hundred pounds. In order to insure that higher class prices will not be charged Rockford-Freeport handlers than those of the Chicago order an adjustment for these months has been included in the order accompanying this decision.

Class I and Class II prices should be determined from the basic price for the month next preceding the delivery period. This will enable producers and handlers to know the Class I and Class II prices early in the delivery period, and will encourage orderly marketing; because similar provisions are included in the orders for the Chicago and Suburban Chicago markets, this provision is necessary in order to maintain prices in the Rockford-Freeport area in line with prices at Chicago and at Suburban Chicago.

(b) The price differential above the basic price for Class I and Class II milk should provide for a pronounced seasonal variation, and should be comparable to those for the Chicago marketing area.

The seasonal pattern of production for this market is significantly different from the pattern of sales of Class I and Class II milk. Production in the peak production month has exceeded that of the low months of the same year by about 60 percent. Sales of Class I and Class II milk have been much more uniform throughout the year. A wide seasonal variation in production creates the problems of surplus handling and disposal in the spring months, and shortages in the fall months. Seasonal changes in class prices to provide incentives for more even production are provided for in the present pricing plans of the marketing area.

The differentials herein recommended are identical with those for the Chicago and Suburban Chicago markets. For some time class prices in effect in the marketing area have been those of the Chicago order. The adoption of the basic prices and differentials herein recommended will continue that practice. These Class I and Class II prices are higher than the minimums that would be required by the Chicago order for Chicago plants located in the marketing area by the zone location differentials of this Chicago order. It is shown from the record, however, that dairy farmers of this area can and do deliver to Chicago plants at which the full Chicago prices are paid. These class prices will not incorporate in the minimum prices of the marketing area the premiums which Rockford producers are currently receiving on their blend prices. Producers did not ask that this be done. Their attitude indicates their belief that the relationship between the markets is so close that it would be unwise to deal separately with the problem for the Rockford-Freeport area. The Class I and Class II prices that should apply to non-Grade "A" milk delivered to unapproved plants which operate routes in the marketing area should be 10 cents less than those for Grade "A" milk delivered to approved plants. This decision follows the pat-

tern of pricing for such milk established in the Suburban Chicago Order.

The recommended Class I and Class II differentials are:

Delivery period	Class I		Class II	
	Grade "A"	Non-grade "A"	Grade "A"	Non-grade "A"
May and June.....	\$0.50	\$0.40	\$0.30	\$0.20
August, September, October, November.....	.90	.80	.50	.40
All other months.....	.70	.60	.40	.30

(c) The Class III price should be the basic formula price for the current delivery period.

This is the price proposed by producers for the notice of hearing. At the hearing, however, they supported the paying price of Northern Illinois condenseries as more nearly reflecting the local prices for manufacturing milk at which Class III milk should be valued. This contention fails to recognize that much Chicago approved milk in the area, and much of the milk to be regulated under the order now is priced for manufacturing use at the basic formula price. Freeport handlers are paying 5 cents more than the basic formula price for all Class III milk they receive at their plants in recognition of the fact that much of their Class III usage is in ice cream, which is a Class II product under the Chicago order. Rockford handlers are paying the basic formula price for their Class III usage. On occasion it is necessary for the cooperative associations to divert milk to local condenseries at which returns are somewhat lower than the 18 condensery average. The quantities of these shipments are uncertain, but relatively small on a yearly basis. The occurrence of these shipments, however, in view of the price which may be obtained for the great bulk of the Class III milk, does not warrant the adoption of the lower price for all Class III milk.

(d) The price computed for each class on the basis of milk of 3.5 percent butterfat content, should be adjusted to reflect the weighted average butterfat content of products used in the respective classes. The adjustment differential for Class III milk should be on the basis of the value of 92-score butter on the Chicago market plus 20 percent. This differential represents the generally accepted value of butterfat made into butter. For Class II milk, the differential should be established at the value of 92-score butter on the Chicago market plus 30 percent. Under the skim milk and butterfat method of classification, the butterfat differential determines much of the value of Class II milk which is principally fluid cream sales. A differential such as contained herein provides a price for fluid cream in line with that which handlers would normally be expected to pay for inspected cream of bottling quality. For Class I milk a differential equal to that for Class II milk is considered appropriate. The record indicates that the average butterfat content of Class I products in the market normally varies little from 3.5 percent. Therefore, the effect of the butterfat differential in Class I milk is largely to determine the relative values

of skim milk and butterfat within the over-all Class I price. The use of the differential recommended recognizes that the additional value of Class I milk over Class II milk is a skim milk value.

(e) The prices that will give milk and its products a purchasing power equivalent to their purchasing power during the base period as determined pursuant to section 2 and section 8 (e) of the act are not reasonable in view of the price of feeds, the available supplies of feeds, and other economic conditions which affect market supply and demand for milk and its products in the proposed marketing area, and the prices contained in this proposed marketing agreement and order will reflect such factors, insure a sufficient quantity of pure and wholesome milk, and in the public interest.

The prices herein recommended reflect the market supply and demand in the proposed marketing area for milk. The active procurement of milk for Chicago which also requires milk of Grade "A" quality is the most effective demand factor in the Rockford-Freepoint production area. The demand for this milk cannot reasonably be ignored in the determination of prices for the Rockford-Freepoint areas. Therefore, the establishment of class prices on the basis of relationships to those already established for Chicago and Suburban Chicago, rather than on the basis of relationship to a base period is considered reasonable. The manufacturing prices selected as basic prices reasonably reflect the price of feeds, and availability of feeds, and the general market supply and demand for milk and its products. The differentials herein recommended reflect the additional costs of supplying milk for fluid use. While class prices equivalent to those included in the recommended order have not provided adequate supplies of producer milk during the approximately one-and-one-half years, they have been in effect, they have not been applied during this time to a classification system adequate to the needs of the market. While the recent record of the market would appear to justify higher class prices, if no classification changes were recommended, it is believed that results of these prices under the classification system proposed should return producers blend prices sufficiently high to attract an adequate supply of milk.

(f) The proposal for inclusion of emergency price provisions should not be adopted. Such provisions were included in Federal milk marketing orders during the war period to cover conditions that no longer exist.

(6) *Payments to producers.* The order should provide for the individual handler type of pool, wherein producers are paid on the basis of the use value of producer milk by the handler to whom they deliver their milk. While producers originally proposed a market-wide pool with equalization of uniform price between handlers, they supported at the hearing the individual handler pool. Handlers agreed that this arrangement would best meet the present needs of the market. The chief weakness of a handler pool in this market would appear to be that the varied producer prices

it produces would not compete entirely with each other, but it would also compete with the price of the dominant Chicago market. There is a possibility that Chicago approved plants may attract milk from Rockford-Freepoint plants with low blend prices while Rockford-Freepoint plants with higher blend prices are attracting milk from Chicago plants. However, under the individual handler type of pool cooperative associations may equalize payments to their members by collecting from handlers and making payments to their members. The associations of this market have been using this practice and there was indication at the hearing that they propose to continue it under the handler pool proposed. This will eliminate much of this problem. There are certain other advantages which a handler pool appears to provide in this market. The handler type pool will reflect to Rockford producers the somewhat higher utilization of that part of the marketing area, thus attracting additional milk to those handlers needing it for Class I and Class II uses. The lower blend prices of Freepoint handlers will also correspond more nearly with the prices paid by Chicago handlers with plants near Freepoint.

Payments to producers for milk varying from 3.5 percent butterfat test should be adjusted by a butterfat differential. The differential included in the order is the same as that now used and is also the same as those of the Chicago and Suburban Chicago orders. It is important that the relationship to the Chicago markets in this respect be maintained.

(7) *Provisions should be included with respect to milk regulated under other Federal orders.* Milk regulated under the Chicago and Suburban Chicago orders is distributed in the proposed marketing area in two ways. Handlers in the marketing area purchase milk from Chicago handlers; packaged milk is purchased regularly for disposition in the original container in which received by some handlers without facilities for packaging milk in paper containers and milk supplies are purchased at times for emergency needs when local supplies are inadequate. In addition, some Chicago and Suburban Chicago handlers distribute directly or through vendors; this direct distribution had up to the time of the hearing been in portions of the proposed marketing area outside the Cities of Rockford and Freepoint, but attempts to make direct distribution in Rockford were proposed by one of the larger Rockford handlers who contemplated transferring his bottling operations for Rockford to a Chicago approved plant which he also operates.

Various proposals concerning regulation of such milk were discussed at the hearing. With respect to that distributed directly or through vendors by handlers from other Federal markets, it is concluded that the simplest and most equitable method would be to exempt such handlers from regulation, except for reporting. Class prices here established parallel closely those of the orders most likely to be involved, and the proposal discussed at the hearing to equalize administrative assessments does not appear warranted. With respect to

milk first received by a handler subject to another order which is later received at the plant of a handler subject to the proposed order, numerous exceptions were received to the treatment as other source milk proposed in the recommended decision. Upon review of the evidence of the hearing concerning the movements of such milk, it is concluded that such treatment is not appropriate for milk regulated under another Federal order which is received in packaged form by a handler subject to the proposed order, and disposed of in the original package in which received. The evidence indicates that local handlers purchased packaged milk from Chicago handlers in order to supply the demands of their trade for milk in paper containers which they do not have facilities to package. Since handlers from other regulated markets may distribute this milk without further regulation, it does not appear equitable to require that local handlers account to local producers for this milk which is neither processed nor packaged in the local handlers' plants. With respect to receipts of bulk milk, skim milk, or cream, which require processing and/or packaging before distribution, this conclusion does not apply. Handlers need purchase bulk supplies only when supplies of producer milk are inadequate, and the allocation provisions applicable to other source milk do not appear to impose any undue economic penalty under such conditions.

(8) *Administrative assessments.* Handlers should be required to bear the costs of administration of the order by the payment of assessments of not more than four cents per hundredweight of receipts of producer milk and of other source milk.

The act provides that such assessments shall be the means of financing costs of administration. The proposed maximum rate of four cents appears reasonable in view of the volume of milk regulated and the experience in markets of similar size. The proposal of handlers that the rate be limited to one cent per hundredweight cannot be adopted because it would not result in sufficient revenue with which to administer the order adequately.

(9) *Deductions for marketing services.* In conformity with the act, provision should be included for providing marketing services for producers who do not belong to a cooperative association, with appropriate deduction therefor. Such provision is specifically authorized by the act. The rate of 5 cents per hundredweight proposed by producers should be provided. If experience indicates that adequate services can be provided at a lower rate, it may be adjusted downward. The proposal should, therefore, be adopted.

(10) *Administrative provisions.* The marketing agreement and order should include other general administrative provisions which are common to all orders and which are necessary for proper and efficient administration of the order. These provisions provide for the selection of a market administrator, define his powers and duties, prescribe the information to be reported by handlers each month, set forth the rules to be followed

by the market administrator in making computations required by the order, and provide for a plan for liquidation of the order in the event of its suspension or termination.

The chief issue raised with respect to these provisions was with respect to the dates by which handlers were required to report each month. The dates here included are later than those proposed, and as late as will reasonably permit payment to producers by the dates recommended for such payments.

Minor modifications in dates for announcing prices and making payments have been made in the order as a result of exceptions received from handlers and producers. The uniform price will be announced one day earlier, and handlers are required to pay cooperative associations earlier than individual producers for milk for which the cooperative association collects payments for milk and makes distribution to producers. In the latter case the association assumes much of the clerical burden and handlers are in position to make the payments more promptly.

Handlers excepted to the lack of provisions with reference to retention of records and termination of obligations. Handlers suggested such provisions at the hearing. However, the necessary substantive provisions were not sufficiently explored to provide a basis for decision from this record. There will be considerable time before these provisions would have any effect which provides opportunity for their consideration at a future hearing.

General findings. (a) The proposed marketing agreement and the order, and all of the terms and conditions thereof will tend to effectuate the declared policy of the act.

(b) The proposed marketing agreement and the order regulate the handling of milk in the same manner as and are applicable only to persons in the respective classes of industrial and commercial activity specified in the proposed marketing agreement upon which the hearing has been held, and

(c) The prices calculated to give milk produced for sale in the said marketing area a purchasing power equivalent to the purchasing power of such milk as determined pursuant to sections 2 and 8 (e) of the act are not reasonable in view of the price of feeds, available supplies of feeds, and other economic conditions which affect market supply of and demand for such milk, and the minimum prices specified in the proposed marketing agreement and order are such prices as will reflect the aforesaid factors, insure a sufficient quantity of pure and wholesome milk and be in the public interest.

Marketing agreement and order. Annexed hereto and made a part hereof are two documents entitled "Marketing agreement regulating the handling of milk in the Rockford-Freeport marketing area" and order regulating the handling of milk in the Rockford-Freeport marketing area," which have been decided upon as the appropriate and detailed means of effecting the foregoing conclusions. These documents shall not become effective unless and until the

requirements of § 900.14 of the rules of practice and procedure governing proceedings to formulate marketing agreements and orders have been met.

It is hereby ordered that all of this decision, except the attached marketing agreement be published in the *FEDERAL REGISTER*. The regulatory provisions of said marketing agreement are identical with those contained in the attached order which will be published with the decision.

This decision filed at Washington, D. C., this 8th day of July 1949.

[SEAL]

CHARLES F. BRANNAN,
Secretary of Agriculture.

*Order Regulating the Handling of Milk in the Rockford-Freeport, Illinois, Marketing Area*¹

§ 991.0 **Findings and determinations**—(a) *Findings upon the basis of the hearing record.* Pursuant to Public Act No. 10, 73d Congress (May 12, 1933) as amended and as reenacted and amended (hereinafter referred to as the "act"), and the rules of practice and procedure governing the formulation of marketing agreements and orders (7 CFR, 900.1 et seq.), a public hearing was held upon a proposed marketing agreement and a proposed order, regulating the handling of milk in the Rockford-Freeport, Illinois, marketing area. Upon the basis of the evidence introduced at such hearing and the record thereof, it is found that:

(1) The said order, and all of the terms and conditions of said order will tend to effectuate the declared policy of the act;

(2) The prices calculated to give milk produced for sale in said marketing area a purchasing power equivalent to the purchasing power of such milk as determined pursuant to sections 2 and 8 (e) of the act are not reasonable in view of the price of feeds, available supplies of feeds, and other economic conditions which affect market supplies of and demand for such milk, and the minimum prices specified in the order, are such prices as will reflect the aforesaid factors, insure a sufficient quantity of pure and wholesome milk, and be in the public interest; and

(3) The said order regulates the handling of milk in the same manner as and is applicable only to persons in the respective classes of industrial and commercial activity specified in a marketing agreement upon which a hearing has been held.

Order relative to handling. It is therefore ordered that on and after the effective date hereof, the handling of milk in the Rockford-Freeport marketing area shall be in conformity to and in compliance with the terms and conditions of the following order.

DEFINITIONS

§ 991.1 **Act.** "Act" means Public Act No. 10, 73d Congress, as amended, and as reenacted and amended by the Agri-

¹ This order shall not become effective unless and until the requirements of § 900.14 of the rules of practice and procedure to formulate marketing agreements and orders have been met.

cultural Marketing Agreement Act of 1937, as amended (7 U. S. C. 601 et seq.).

§ 991.2 **Secretary.** "Secretary" means the Secretary of Agriculture or other officer or employee of the United States authorized to exercise the powers or to perform the duties of the said Secretary of Agriculture.

§ 991.3 **Department.** "Department" means the United States Department of Agriculture or such other Federal agency authorized to perform the price reporting functions specified in §§ 991.50, 991.54 and 991.81.

§ 991.4 **Person.** "Person" means any individual, partnership, corporation, association, or any other business unit.

§ 991.5 **Cooperative association.** "Cooperative association" means any cooperative marketing association which the Secretary determined, after application by the association;

(a) To be qualified under the provisions of the Act of Congress of February 18, 1922, as amended, known as the "Capper Volstead Act"; and

(b) To have full authority in the sale of milk of its members and to be engaged in making collective sales or marketing milk or its products for its members.

§ 991.6 **Delivery period.** "Delivery period" means the calendar month or the total portion thereof during which this order is in effect.

§ 991.7 **Rockford-Freeport marketing area.** "Rockford-Freeport marketing area" hereinafter called the "marketing area," means the territory lying within the corporate limits of the Cities of Rockford and Freeport, together with the territory lying within the Townships of Burritt, Cherry Valley, Harlem, Owen, Rockford and Winnebago, in Winnebago County, and Florence, Harlem, Lancaster and Silver Creek, in Stephenson County, all in the State of Illinois.

§ 991.8 **Route.** "Route" means a delivery (including at a plant store) of milk, skim milk, buttermilk, flavored milk, or flavored milk drink in fluid form to a wholesale or retail stop(s) other than to a milk processing or distributing plant(s).

§ 991.9 **Approved plant.** "Approved plant" means a milk processing or distributing plant approved by the appropriate authorities for distribution of Grade "A" milk under the milk ordinance of any municipality in the marketing area or under the Grade "A" milk and Grade "A" milk products law of the State of Illinois, and from which a route is operated wholly or partially within the marketing area. The term "approved plant" does not include any portions of the plant or facilities used for processing milk or any milk product required by the appropriate health authorities to be kept physically separate from that portion of the plant facilities used for receiving, processing, or packaging milk or milk products to be labeled Grade "A".

§ 991.10 **Unapproved plant.** "Unapproved plant" means any milk processing

or distributing plant which is not an approved plant.

§ 991.11 Handler. "Handler" means:

(a) The operator of an approved plant in his capacity as such; or
(b) The operator of an unapproved plant from which a route is operated wholly or partially within the marketing area;

(c) A cooperative association with respect to milk of producers caused to be diverted for its account from an approved plant to an unapproved plant from which no route is operated within the marketing area.

§ 991.12 Producer. "Producer" means either of the following:

(a) "Grade A producer" means any person, except a producer-handler, who under inspection of the appropriate health authorities of any of the municipalities of the marketing area, or of the State of Illinois, produces milk approved by such authority for distribution as Grade "A" milk within the marketing area, which milk is received at an approved plant, or is diverted by a cooperative association for its account from an approved plant to an unapproved plant; or

(b) "Non-Grade A producer" means any person, except a producer-handler, who produces milk which is received at an unapproved plant from which a route is operated in the marketing area.

§ 991.13 Producer milk. "Producer milk" means either of the following: (a) "Grade A producer milk" means milk of one or more producers produced and received or diverted under the conditions set forth in § 991.12 (a).

(b) "Non-Grade A producer milk" means milk of one or more producers produced and received under the conditions set forth in § 991.12 (b).

§ 991.14 Other source milk. "Other source milk" means skim milk or butterfat received at an approved plant, or at an unapproved plant from which a route is operated wholly or partially within the marketing area, except that contained in (a) producer milk, (b) in receipts from other handlers, (c) in receipts from handlers under any marketing agreement and order issued pursuant to the act for any other fluid milk marketing area of items listed herein as Class I milk or Class II milk in packaged or bottled form ready for delivery to consumers, which are disposed of in the original package in which received; and (d) in any non-fluid milk product received from a non-handler and disposed of in the form in which received.

§ 991.15 Producer-handler. "Producer-handler" means any person who produces milk and operates a route in the marketing area, but who receives no milk from producers.

MARKET ADMINISTRATOR

§ 991.20 Designation. The agency for the administration hereof shall be a market administrator, selected by the Secretary, who shall be entitled to such compensation as may be determined by, and shall be subject to removal at the discretion of the Secretary.

§ 991.21 Powers. The market administrator shall have the following powers with respect to this order:

(a) To administer its terms and provisions;

(b) To receive, investigate, and report to the Secretary complaints of violations;

(c) To make rules and regulations to effectuate its terms and provisions; and

(d) To recommend amendments to the Secretary.

§ 991.22 Duties. The market administrator shall perform all duties necessary to administer the terms and provisions of this order, including, but not limited to, the following:

(a) Within 30 days following the date on which he enters upon his duties, or such lesser period as may be prescribed by the Secretary, execute and deliver to the Secretary a bond, effective as of the date on which he enters upon such duties and conditioned upon the faithful performance of such duties, in an amount and with surety thereon satisfactory to the Secretary;

(b) Employ and fix the compensation of such persons as may be necessary to enable him to administer its terms and provisions;

(c) Obtain a bond in a reasonable amount and with reasonable surety thereon covering each employee who handles funds entrusted to the market administrator;

(d) Pay, out of the funds provided by § 991.82:

(1) The cost of his bond and of the bonds of his employees;

(2) His own compensation; and

(3) All other expenses, except those incurred under § 991.83, necessarily incurred by him in the maintenance and functioning of his office and in the performance of his duties;

(e) Keep such books and records as will clearly reflect the transactions provided for herein, and, upon request by the Secretary surrender the same to such other person as the Secretary may designate;

(f) Publicly announce, unless otherwise directed by the Secretary, by posting in a conspicuous place in his office and by such other means as he deems appropriate, the name of any person who within 10 days after the day upon which he is required to perform such act, has not (1) made reports pursuant to §§ 991.30, 991.31 or 991.32, (2) maintained adequate records and facilities pursuant to § 991.33, or (3) record the payments required under §§ 991.80, 991.81, 991.82 or 991.83;

(g) Submit his books and records to examination by the Secretary and furnish such information and reports as may be requested by the Secretary;

(h) On or before the 10th day after the end of each delivery period report to each cooperative association which so requests the amount and class utilization of milk caused to be delivered by such cooperative association, either directly or from producers who have authorized such cooperative association to receive payments for them, to each handler to whom the cooperative association sells milk. For the purpose of this re-

port the milk caused to be so delivered by a cooperative association shall be prorated to each class in the proportion that the total receipts of milk received from producers by such handler were used in each class;

(i) Audit all reports and payments by each handler by inspection of such handler's records and of the records of any handler or person upon whose utilization and classification of skim milk or butterfat for such handler depends;

(j) Publicly announce, by posting in a conspicuous place in his office and by such other means as he deems appropriate, the prices determined for each delivery period as follows:

(1) On or before the 5th day after the end of such delivery period, the minimum class prices pursuant to §§ 991.51, 991.52 and 991.53, and the butterfat differentials for each class pursuant to § 991.54, and

(2) On or before the 11th day after the end of such delivery period, the uniform prices computed, pursuant to § 991.71 and the butterfat differential computed pursuant to § 991.81 and

(k) Prepare and disseminate to the public such statistics and information as he deems advisable and as do not reveal confidential information.

REPORTS, RECORDS AND FACILITIES

§ 991.30 Delivery period reports of receipts and utilization. On or before the 8th day after the end of each delivery period each handler, except a producer-handler, shall report to the market administrator in the detail and on forms prescribed by the market administrator:

(a) The quantities of butterfat and quantities of skim milk contained in (or used in the production of) all receipts within such delivery period of (1) producer milk, (2) skim milk and butterfat in any form from any other handler, and (3) other source milk; and the sources thereof;

(b) The product pounds of Class I and Class II milk received in packaged or bottled form ready for delivery to consumers from handlers under any marketing agreement and order issued pursuant to the act for any other fluid milk marketing area, and disposed of in the form in which received;

(c) The product pounds of non-fluid milk products received from any non-handler and disposed of in the same form;

(d) The utilization of all receipts required to be reported under paragraphs (a) and (b) and (c) of this section; and

(e) Such other information with respect to all such receipts and utilization as the market administrator may prescribe.

§ 991.31 Producer payroll reports. On or before the 25th day after the end of each delivery period each handler shall submit to the market administrator such handler's producer payroll for the preceding delivery period, which shall show (a) the total pounds of milk received from each producer and cooperative association and the total pounds of butterfat contained in such milk, (b) the amount of payment to each producer and cooperative association and (c) the nature and amount of any deductions and

charges involved in the payments referred to in paragraph (b) of this section.

§ 991.32 *Reports by producer handlers.* Each producer-handler shall make reports to the market administrator at such time and in such manner as the market administrator may prescribe.

§ 991.33 *Records and facilities.* Each handler shall maintain and make available to the market administrator or to his representative during the usual hours of business, such accounts and records of his operations and such facilities as are necessary for the market administrator to verify or to establish the correct data with respect to:

(a) The receipts and utilization, in whatever form, of all skim milk and butterfat received, including milk products received and disposed of in the same form;

(b) The weights, samples and tests for butterfat and for other content of all skim milk and butterfat handled;

(c) Payments to producers and cooperative association; and

(d) The pounds of skim milk and butterfat contained in or represented by all milk, skim milk, cream and each milk product on hand at the beginning and at the end of each delivery period.

CLASSIFICATION

§ 991.40 *Skim milk and butterfat to be classified.* All skim milk and butterfat, in any form, received within the delivery period by a handler, in producer milk, in other source milk, and from another handler shall be classified by the market administrator pursuant to the provisions of §§ 991.41 to 991.46.

§ 991.41 *Classes of utilization.* Subject to the conditions set forth in § 991.43 and § 991.44 the skim milk and butterfat described in § 991.40 shall be classified separately by the market administrator on the basis of the following classes:

(a) Class I milk shall be all skim milk (including reconstituted skim milk) and butterfat;

(1) Disposed of in fluid form as milk, skim milk, buttermilk, flavored milk or flavored milk drink (except as provided in paragraph (c) (4) of this section; or

(2) Not specifically accounted for as any item included under subparagraph (1) of this paragraph or as Class II milk or Class III milk.

(b) Class II milk shall be all skim milk (including reconstituted skim milk) and butterfat disposed of in fluid form as

(1) Cream or as any mixture containing cream and milk or skim milk (not including ice cream mix) containing not less than 6 percent of butterfat, or

(2) Eggnog.

(c) Class III milk shall be all skim milk and butterfat:

(1) Used to produce a milk product other than any of those specified in paragraph (a) (1) or in paragraph (b) of this section;

(2) In actual plant shrinkage of producer milk computed pursuant to § 991.42, but not in excess of 2 percent thereof;

(3) In inventory variation of milk, skim milk, cream or of any Class I or Class II product;

(4) In skim milk, flavored milk, flavored milk drink or buttermilk dumped or disposed of for livestock feed;

(5) In actual plant shrinkage of other source milk computed pursuant to § 991.42.

§ 991.42 *Shrinkage.* The market administrator shall determine the shrinkage of skim milk and butterfat, respectively, in producer milk and in other source milk in the following manner:

(a) Compute the total shrinkage of skim milk and butterfat, respectively, for each handler; and

(b) Prorate the total shrinkage of skim milk and butterfat, respectively, computed pursuant to paragraph (a) of this section between producer milk and other source milk after deducting receipts from other handlers.

§ 991.43 *Responsibility of handlers and reclassification of milk.* (a) All skim milk and butterfat shall be Class I milk, unless the handler who first receives such skim milk or butterfat proves to the market administrator that such skim milk or butterfat should be classified otherwise.

(b) Any skim milk or butterfat (except that transferred to a producer-handler) classified in one class shall be reclassified if used or reused by such handler or by another handler in another class.

§ 991.44 *Transfers.* Skim milk or butterfat disposed of by a handler either by transfer or diversion shall be classified:

(a) As Class I milk if transferred in the form of milk or skim milk, and as Class II milk if so disposed of in the form of cream, to the regulated plant of another handler (except a producer-handler) unless utilization in another class is mutually indicated in writing to the market administrator by both handlers on or before the 8th day after the end of the delivery period within which such transaction occurred: *Provided*, That skim milk or butterfat so assigned to a particular class shall be limited to the amount thereof remaining in such class in the plant of the transferee-handler after the subtraction of other source milk pursuant to § 991.46 (a) (2), and any excess of such skim milk or butterfat, respectively, shall be assigned in series beginning with the next higher priced available utilization: *And provided further*, That in no event shall skim milk or butterfat so transferred or diverted be so classified that other source milk is assigned to any higher class in the plant of the transferring handler than the lowest class to which producer milk (other than allowable shrinkage) is assigned in the plant of the transferee-handler, after application of the allocation provisions of § 991.46.

(b) As Class I milk if transferred to a producer-handler in the form of milk or skim milk and as Class II milk if so disposed of in the form of cream;

(c) As class I milk if transferred in bulk in the form of milk or skim milk or diverted, and as Class II milk if transferred in the form of cream, to an un-

approved plant from which no route is operated in the marketing area unless, except as provided in paragraph (d) of this section;

(1) The handler claims another class on the basis of a utilization mutually indicated in writing to the market administrator by both the buyer and seller on or before the 8th day after the end of the delivery period within which such transaction occurred;

(2) The buyer maintains books and records showing the utilization of all skim milk and butterfat at his plant which are made available if requested by the market administrator for the purpose of verification;

(3) Such buyer's plant had actually used not less than an equivalent amount of skim milk and butterfat in the use indicated in such statement: *Provided*, That if upon inspection of his records such buyer's plant had not actually used an equivalent amount of skim milk and butterfat in such indicated use, the remaining pounds shall be classified on the basis of the next lower-priced available use in accordance with the classes set forth in § 941.41 and

(d) As Class I milk if transferred or diverted in the form of milk or skim milk, and as Class II milk is transferred in the form of cream, to an unapproved plant located 100 miles or more from the marketing area, by shortest highway distance as determined by the market administrator.

§ 991.45 *Computation of skim milk and butterfat in each class.* For each delivery period, the market administrator shall correct for mathematical and for other obvious errors the delivery period report submitted by each handler and compute the total pounds of skim milk and butterfat, respectively, in Class I milk, Class II milk, and Class III milk for such handler.

§ 991.46 *Allocation of skim milk and butterfat classified.* (a) The pounds of skim milk remaining in each class after making the following computations shall be the pounds in such class allocated to producer milk;

(1) Subtract plant shrinkage of skim milk in producer milk pursuant to § 991.41 (c) (2) from the total pounds of skim milk in Class III milk;

(2) Subtract from the remaining pounds of skim milk in each class, in series beginning with the lowest priced available use, the pounds of skim milk in other source milk;

(3) Subtract from the remaining pounds of skim milk in each class the skim milk received from other handlers and assigned pursuant to § 991.44.

(4) Add to the remaining pounds of skim milk in Class III milk the pounds subtracted pursuant to subparagraph (1) of this paragraph; or if the remaining pounds of skim milk in all classes exceed the pounds of skim milk in producer milk, subtract such excess from the remaining pounds of skim milk in series beginning with lowest-prices available use.

(b) Allocate classified butterfat to producer milk according to the method prescribed in paragraph (a) of this section for skim milk.

(c) Determine the weighted average butterfat test of the remaining Class I milk, Class II milk, and Class III milk computed pursuant to paragraph (a) and (b) of this paragraph.

MINIMUM PRICES

§ 991.50 *Basic formula price to be used in determining class prices.* The basic formula price per hundredweight of milk to be used in determining the Class I and Class II prices provided by this section shall be the highest of the prices per hundredweight for milk of 3.5 percent butterfat content determined by the market administrator pursuant to paragraphs (a), (b), or (c) of this section, computed to the nearest tenth of a cent.

(a) The average of the basic (or field prices per hundredweight) reported to have been paid, for milk of 3.5 percent butterfat content received from farmers during the delivery period at the following plants or places for which prices have been reported to the market administrator or to the Department:

Present Operator and Location

Borden Co., Black Creek, Wis.
Borden Co., Greenville, Wis.
Borden Co., Mt. Pleasant, Mich.
Borden Co., New London, Wis.
Borden Co., Orfordville, Wis.
Carnation Co., Berlin, Wis.
Carnation Co., Jefferson, Wis.
Carnation Co., Chilton, Wis.
Carnation Co., Richland Center, Wis.
Carnation Co., Oconomowoc, Wis.
Carnation Co., Sparta, Mich.
Pet Milk Co., Bellesville, Wis.
Pet Milk Co., Coopersville, Mich.
Pet Milk Co., Hudson, Mich.
Pet Milk Co., New Glarus, Wis.
Pet Milk Co., Wayland, Mich.
White House Milk Co., Manitowoc, Wis.
White House Milk Co., West Bend, Wis.

(b) The price per hundredweight computed as follows:

(1) Multiply by six the average daily wholesale price per pound of 92-score butter in the Chicago market as reported by the Department during the delivery period;

(2) Add an amount equal to 2.4 times the average weekly prevailing price per pound of "Twins" during the delivery period on the Wisconsin Cheese Exchange at Plymouth, Wisconsin: *Provided*, That if the price of "Twins" is not quoted on the Wisconsin Cheese Exchange the weekly prevailing price per pound of "Cheddars" shall be used; and

(3) Divide by seven, add 30 percent thereof, and then multiply by 3.5.

(c) The price per hundredweight computed by adding together the plus values pursuant to subparagraphs (1) and (2) of this paragraph:

(1) From the average daily wholesale price per pound of 92-score butter in the Chicago market, as reported by the Department during the delivery period, subtract two cents, add 20 percent thereof, and then multiply by 3.5; and

(2) From the arithmetical average of the carlot prices per pound for non-fat dry milk solids (not including that specifically designated animal feed) spray and roller process, f. o. b. manufacturing plants in the Chicago area as published by the Department during the delivery period, deduct 5.5 cents for all delivery

periods other than March, April, May and June, or deduct 6.5 cents for such delivery periods, multiply by 8.5 and then multiply by 0.965, except that if such agency does not publish such prices f. o. b. manufacturing plants, there shall be used for the purpose of this computation the arithmetical average of the carlot prices thereof, delivered at Chicago, Illinois, as published weekly by such agency during the delivery period; and in the latter event the respective amounts "5.5" cents and "6.5" cents shall each be increased by one cent.

§ 991.51 *Class I milk prices.* Subject to the provisions of § 991.54, the minimum price per hundredweight, on a 3.5 percent butterfat content basis, to be paid by each handler at his plant, for producer milk received and classified as Class I milk, shall be the basic formula price for the preceding delivery period determined pursuant to § 991.50, plus the following:

Delivery period	Amount	
	Grade "A"	Nongrade "A"
May and June.....	\$0.50	\$0.40
August, September, October, November.....	.90	.80
All other months.....	.70	.60

§ 991.52 *Class II milk prices.* Subject to the provisions of § 991.54, the minimum price per hundredweight, on a 3.5 percent butterfat content basis, to be paid by each handler, at his plant, for producer milk received and classified as Class II milk, shall be the basic formula price for the preceding delivery period determined pursuant to § 991.50, plus the following:

Delivery period	Amount	
	Grade "A"	Nongrade "A"
May and June.....	\$0.30	\$0.20
August, September, October, November.....	.50	.40
All other months.....	.40	.30

§ 991.53 *Class III milk prices.* Subject to the provisions of § 991.54, the minimum price per hundredweight, on a 3.5 percent butterfat basis to be paid by each handler, at his plant, for producer milk received and classified as Class III milk shall be the same as the basic formula price for the current delivery period.

§ 991.54 *Butterfat differentials to handlers.* If for any handler the weighted average butterfat test of his producer milk in any class is more or less than 3.5 percent, there shall be added to or subtracted from, as the case may be, the price for such class, for each one-tenth of one percent that such weighted average butterfat test is above or below 3.5 percent a butterfat differential (computed to the nearest tenth of a cent) calculated by the market administrator for such class as follows:

(a) Class I milk—multiply by 1.30 the average daily wholesale price per

pound of 92-score butter in the Chicago market as reported by the Department for the previous delivery period and divide the result by 10.

(b) Class II milk—multiply by 1.30 the average daily wholesale price per pound of 92-score butter in the Chicago market as reported by the Department for the previous delivery period and divide the result by 10.

(c) Class III milk—multiply by 1.20 the average daily wholesale price per pound of 92-score butter in the Chicago market as reported by the Department during the delivery period and divide the result by 10.

APPLICATION OF PROVISIONS

§ 991.60 *Producer-handlers.* Sections 991.40 to 991.46, 991.50 to 991.54, 991.70 to 991.72, and 991.80 to 991.84, shall not apply to a producer-handler.

§ 991.61 *Milk subject to pricing under other Federal orders.* Except as follows, milk priced under any other Federal milk marketing agreement or order for any other fluid milk marketing area shall not be subject to the provisions of this order:

(a) If such milk is disposed of on a route in the marketing area operated by or for a person subject to regulation as a handler under another order, such person shall report as requested by the market administrator, but shall not otherwise be considered a handler under this order;

(b) If such milk is received at the regulated plant of a handler subject to the provisions of this order in any form other than those stated in § 991.4 (c) and (d), it shall be considered as other source milk;

(c) If the provisions of the order for the other milk marketing area provide for determination as to the order under which milk shall be priced, the Secretary shall so determine; and

(d) Milk received at a plant where any fluid milk is received and bottled for distribution as Class I milk in the marketing area defined in Federal Order No. 69 regulating the handling of milk in the Suburban Chicago, Illinois, milk marketing area shall be subject to pricing and payment under this order only in the event that the Secretary determines that a greater portion of such milk is distributed as Class I and Class II milk in the marketing area herein defined than is disposed of in the marketing area defined in Federal Order No. 69.

DETERMINATION OF UNIFORM PRICES

§ 991.70 *Computation of value of milk.* The value of producer milk received during each delivery period by each handler shall be a sum of money computed by the market administrator by multiplying the pounds of such milk in each class for the delivery period, by the applicable class prices, and adding together the resulting amounts: *Provided*, That if a handler, after subtracting other source milk and receipts from other handlers, has disposed of skim milk or butterfat in excess of the skim milk or butterfat which, on the basis of his report for the delivery period

pursuant to § 991.30 has been credited to producers as having been received from them, there shall be added an amount computed by multiplying the pounds in each class as subtracted pursuant to §§ 991.46 (a) (4) and 991.46 (b) by the applicable class prices.

§ 991.71 *Computation of uniform prices for each handler.* For each delivery period the market administrator shall compute for each handler a uniform price per hundredweight, on the basis of 3.5 percent butterfat content, for producer milk received by such handler as follows:

(a) From the value of milk computed for such handler pursuant to § 991.70, deduct, if the weighted average butterfat test of all producer milk received by him is greater than 3.5 percent, or add, if the weighted average butterfat test of such milk is less than 3.5 percent, an amount computed by multiplying the variation from 3.5 percent, of such weighted average test by the producer butterfat differential specified in § 991.81, and multiplying the resulting figure by the total hundredweight of such milk;

(b) Add, or subtract, as the case may be, the amount necessary to correct errors in classification for previous delivery periods, as disclosed by audit of the market administrator;

(c) Adjust the resulting amount by the sum of money used in adjusting the uniform price pursuant to paragraph (e) of this section for the preceding delivery period to the nearest cent;

(d) Divide the result by the total hundredweight of milk received from producers by the handler during the delivery period; and

(e) Adjust the resulting figure to the nearest cent.

§ 991.72 *Notification of handlers.* On or before the 11th day after the end of each delivery period, the market administrator shall mail to each handler at his last known address, a statement showing:

(a) The amount and value of his milk in each class and the totals thereof;

(b) The uniform price for such handler pursuant to § 991.91 and the butterfat differentials computed pursuant to § 991.81.

(c) The amounts to be paid by each handler pursuant to §§ 991.80 to 991.84.

PAYMENTS

§ 991.80 *Payments to producers.* Each handler shall make payments on or before the 15th day after the end of each delivery period to each producer, or on or before the 13th day after the end of each delivery period to each cooperative association, at not less than the uniform price for such delivery period pursuant to § 991.71 adjusted by the producer butterfat differential pursuant to § 991.81 for all milk received from such producer or cooperative association during such delivery period.

§ 991.81 *Producer butterfat differential.* In making payments pursuant to § 991.80 there shall be added to, or subtracted from, the uniform price for milk

of 3.5 percent butterfat content, for each one-tenth of one percent of butterfat content in such producer milk above or below 3.5 percent, as the case may be, an amount computed by multiplying the average daily wholesale price per pound of 92-score butter in Chicago, as reported by the Department for the delivery period, by 1.20, dividing by 10, and rounding to the nearest tenth of a cent.

§ 991.82 *Expense of administration.* As his prorata share of the expense incurred pursuant to § 991.22 (d) each handler shall pay the market administrator, on or before the 15th day after the end of each delivery period, 4 cents per hundredweight, or such lesser amount as the Secretary from time to time may prescribe with respect to all milk received within the delivery period from producers (including such handler's own production) and from sources other than producers or other handlers.

§ 991.83 *Marketing services.*—(a) *Deductions.* Except as set forth in paragraph (b) of this section, each handler for each delivery period shall deduct 5¢ per hundredweight or such lesser amount as may be prescribed by the Secretary from the payments made to each producer pursuant to § 991.80, and shall pay such deductions to the market administrator on or before the 15th day after the end of such delivery period. Such monies shall be used by the market administrator to check weights, samples and tests of producer milk received by handlers and to provide producers with market information. Such services to be performed by the market administrator or by an agent engaged by and responsible to him.

(b) *Deductions with respect to members of, or producers marketing through, a cooperative association.* In the case of producers for whom a cooperative association is actually performing the services set forth in paragraph (a) of this section, but for whom such cooperative association does not receive payment for milk, each handler shall make in lieu of the deduction specified in paragraph (a) of this section such deductions from the payment to be made to such producers as may be authorized by the membership agreement or marketing contract between such cooperative association and such producers and on or before the 12th day after the end of such delivery period pay every such deduction to the cooperative association rendering such services.

§ 991.84 *Adjustment of accounts.*—(a) *Errors in payments.* Whenever audit by the market administrator of any handler's reports, books, records, or accounts disclose errors resulting in monies due:

(1) The market administrator from such handler,

(2) Such handler from the market administrator, or

(3) Any producer or cooperative association from such handler, the market administrator shall promptly notify such handler of any such amount due; and payment thereof shall be made on or before the next date for making payment set forth in the provision under which

such error occurred following the 5th day after such notice.

(b) *Interest on overdue accounts.* Any unpaid obligation of a handler pursuant to §§ 991.80, 991.81, 991.82, 991.83, or this section shall be increased one-half of one percent on the first day of the calendar month next following the due date of such obligation and on the first day of each calendar month thereafter until such obligation is paid.

MISCELLANEOUS PROVISIONS

§ 991.90 *Effective time, suspension, or termination.*—(a) *Effective time.* The provisions hereof or any amendments hereto shall become effective at such time as the Secretary may declare and shall continue in force until suspended or terminated.

(b) *Suspension or termination.* The Secretary may suspend or terminate this order or any provision hereof whenever he finds that this order or any provision hereof obstructs or does not tend to effectuate the declared policy of the act. This order shall terminate in any event whenever the provisions of the act authorizing it cease to be in effect.

(c) *Continuing obligations.* If, upon the suspension or termination of any or all provisions of this order, there are any obligations thereunder the final accrual or ascertainment of which requires further acts by any person (including the market administrator), such further acts shall be performed notwithstanding such suspension or termination.

(d) *Liquidation.* Upon the suspension or termination of the provisions hereof, except this section, the market administrator, or such other liquidating agent, as the Secretary may designate, shall if so directed by the Secretary, liquidate the business of the market administrator's office, dispose of all property in his possession or control, including accounts receivable, and execute and deliver all assignments or other instruments necessary or appropriate to effectuate any such disposition. If a liquidating agent is so designated, all assets, books, and records of the market administrator shall be transferred promptly to such liquidating agent. If upon such liquidation, the funds on hand exceed the amounts required to pay outstanding obligations of the office of the market administrator and to pay necessary expenses of liquidation and distribution, such excess shall be distributed to contributing handlers and producers in an equitable manner.

§ 991.91 *Agents.* The Secretary may, by designation in writing, name any officer or employee of the United States to act as his agent or representative in connection with any of the provisions hereof.

§ 991.92 *Separability of provisions.* If any provision hereof, or its application to any person or circumstances, is held invalid, the application of such provision, and of the remaining provisions hereof, to other persons or circumstances shall not be affected thereby.

[F. R. Doc. 49-5822; Filed, July 15, 1949; 8:53 a. m.]

5. Delete §§ 34.3113 to 34.3928, inclusive, and substitute therefor the following new sections:

§ 34.3100 *Domestic message revenue.*
(a) This account, when maintained under the option provided in § 34.03-5 (a), shall include the carrier's portion of revenue from the transmission of messages between points in the continental United States, Alaska, Canada, Saint Pierre-Miquelon, and Mexico.

(b) When maintained, this account shall include, also, the carrier's portion of revenue from the transmission of transoceanic and marine messages in so far as such transmission is performed within the area comprising the continental United States, Alaska, Canada, Saint Pierre-Miquelon, and Mexico. (See particularly § 34.3160.)

(c) This account shall be cleared on a monthly basis prior to entries herein for any succeeding month.

§ 34.3110 *Public message revenue.*
This account shall include the carrier's portion of revenue from the transmission within the continental United States, Alaska, Canada, Saint Pierre-Miquelon, and Mexico, of messages at effective rates available to the general public.

§ 34.3115 *U. S. Government message revenue.*
This account shall include the carrier's portion of revenue from the transmission within the continental United States, Alaska, Canada, Saint Pierre-Miquelon, and Mexico, of messages at effective rates available to the United States Government.

§ 34.3120 *Other governments message revenue.*
This account shall include the carrier's portion of revenue from the transmission within the continental United States, Alaska, Canada, Saint Pierre-Miquelon, and Mexico, of messages at effective rates available to governments other than the United States Government.

§ 34.3125 *Press message revenue.*
This account shall include the carrier's portion of revenue from the transmission within the continental United States, Alaska, Canada, Saint Pierre-Miquelon, and Mexico, of messages at effective rates available to organizations engaged in publication of the substance of such messages.

§ 34.3160 *Domestic transmission of transoceanic and marine messages.*
This account shall include the carrier's

§ 34.31-99 *Contemplated form of operating-revenue statement.* (See § 34.03-9.)

7. In accordance with the provisions of § 1.764 of the Commission's rules and regulations, an original and 14 copies of all statements, briefs, or comments filed shall be furnished the Commission.

Adopted: July 6, 1949.

Released: July 7, 1949

FEDERAL COMMUNICATIONS

COMMISSION,

T. J. SLOWIE,

Secretary.

1. Amend § 34.02-1 by adding new definitions as follows:

"Domestic message revenue" means revenue from the "transmission" of messages between points within the area comprising the "Continental United States," Alaska, Canada, Saint Pierre-Miquelon, and Mexico. It includes revenue from both "fixed transmission" and "mobile transmission" of messages within such area.

"Transoceanic message revenue" means revenue from the "transmission" of messages between points outside the area comprising the "Continental United States," Alaska, Canada, Saint Pierre-Miquelon, and Mexico, and between such points and points designated as gateway points (or "Continental terminus"). It includes revenue from both "foreign transmission" and "insular transmission" of messages between such points.

2. Amend § 34.02-1 by revising the definition of "Continental United States" by the deletion therefrom of the term "the Territory of Alaska" so that the definition will read as follows:

"Continental United States" means the several States of the United States and the District of Columbia.

3. Amend § 34.02-1 by deleting from the definition of "Insular communication" the words "the Philippine Islands and", and by deleting from the definition of "United States," the words "the Philippine Islands or."

4. Amend § 34.31-99 to read as follows:

FEDERAL COMMUNICATIONS COMMISSION

[47 CFR, Part 34]

[Docket No. 9370]

UNIFORM SYSTEM OF ACCOUNTS FOR RADIOTELEGRAPH CARRIERS

NOTICE OF PROPOSED RULE MAKING

1. Notice is hereby given of proposed rule making in the above-entitled matter.

2. Sections 34.31-99 and 34.3113 to 34.3928, inclusive, of the Commission's rules and regulations regarding uniform operating-revenue accounts for Radiotelegraph Carriers were promulgated by the Commission in 1939 to become effective on January 1, 1940, and were designed to reflect the several sources of revenue of radiotelegraph carriers as then existing.

3. Progress in the art of radiotelegraph communication, the withdrawal of radiotelegraph carriers from the field of domestic telegraph communication, changes in the types of services rendered, and other developments within the past decade have occasioned a need for substantial revision of these rules.

4. Therefore, it is proposed to amend Part 34 of the Commission's rules and regulations as provided below, such amendments to become effective 6 months after the adoption of a final order herein, with the provision, however, that, if the amendments are adopted, any carrier may adopt the modified accounting procedure with respect to the prior months of the calendar year 1950.

5. The proposed amendment is issued under authority of sections 4 (1) and 220 of the Communications Act of 1934, as amended.

6. Any interested person who is of the opinion that the proposed amendment should not be adopted, or should not be adopted in the manner set forth herein, may file with the Commission on or before August 16, 1949, a statement or brief setting forth his comments. At the same time persons favoring the amendment as proposed may file statements in support thereof. Before taking action in the matter the Commission will consider all such comments that are presented; and, if any comments are sub-

portion of revenue from the transmission of (a) transoceanic messages between gateway points and points within the continental United States, Alaska, Canada, Saint Pierre-Miquelon, and Mexico, and (b) marine messages between land stations and points within the continental United States, Alaska, Canada, Saint Pierre-Miquelon, and Mexico.

§ 34.3199 Other message revenue. This account shall include the carrier's portion of revenue from the transmission within the continental United States, Alaska, Canada, Saint Pierre-Miquelon, and Mexico, of messages at effective rates available to persons or organizations other than those provided for in §§ 34.3110 to 34.3160, inclusive.

§ 34.3200 Transoceanic message revenue. (a) This account, when maintained under the option provided in § 34.03-5 (a), shall include the carrier's portion of revenue from the transmission of messages (other than marine messages) between points outside the area comprising the continental United States, Alaska, Canada, Saint Pierre-Miquelon, and Mexico, and between such points and points designated as gateway points in the continental United States. (See § 34.3160.)

(b) This account shall be cleared on a monthly basis prior to entries herein for any succeeding month.

§ 34.3210 Public message revenue. This account shall include the carrier's portion of revenue from the transmission between gateway points and points outside the continental United States, Alaska, Canada, Saint Pierre-Miquelon, and Mexico, of messages (other than marine messages) at effective rates available to the general public.

§ 34.3215 U. S. Government message revenue. This account shall include the carrier's portion of revenue from the transmission between gateway points and points outside the continental United States, Alaska, Canada, Saint Pierre-Miquelon, and Mexico, of messages (other than marine messages) at effective rates available to the United States Government.

§ 34.3220 Other governments' message revenue. This account shall include the carrier's portion of revenue from the transmission between gateway points and points outside the continental United States, Alaska, Canada, Saint Pierre-Miquelon, and Mexico, of messages (other than marine messages) at effective rates available to governments other than the United States Government.

§ 34.3225 Press message revenue. This account shall include the carrier's portion of revenue from the transmission between gateway points and points outside the continental United States, Alaska, Canada, Saint Pierre-Miquelon, and Mexico, of messages (other than marine messages) at effective rates available to organizations engaged in publication of the substance of such messages. (See particularly § 34.3705; see also § 34.3735.)

§ 34.3299 Other message revenue. (a) This account shall include the carrier's portion of revenue from the transmission

between gateway points and points outside the continental United States, Alaska, Canada, Saint Pierre-Miquelon, and Mexico, of messages (other than marine messages) at effective rates available to persons or organizations other than those provided for in §§ 34.3210 to 34.3225, inclusive.

(b) This account shall include, in a separate subdivision hereof, the carrier's portion of revenue from the transmission of messages (other than marine messages) between points outside the continental United States, Alaska, Canada, Saint Pierre-Miquelon, and Mexico (i. e., messages that do not originate or terminate at, or transit through, points within such area).

§ 34.3300 Marine message revenue. (a) This account, when maintained under the option provided in § 34.03-5 (a), shall include the carrier's portion of revenue from the transmission of messages between ship stations and land stations, including the revenue applicable to the land station. (See § 34.3160.)

(b) This account shall be cleared on a monthly basis prior to entries herein for any succeeding month.

§ 34.3310 Public message revenue. This account shall include the carrier's portion of revenue from the transmission between ship stations and land stations in the United States (including the revenue applicable to the land station) of messages at effective rates available to the general public.

§ 34.3315 U. S. Government message revenue. This account shall include the carrier's portion of revenue from the transmission between ship stations and land stations in the United States (including the revenue application to the land station) of messages at effective rates available to the United States Government.

§ 34.3320 Other governments' message revenue. This account shall include the carrier's portion of revenue from the transmission between ship stations and land stations in the United States (including the revenue application to the land station) of messages at effective rates available to governments other than the United States Government.

§ 34.3325 Press message revenue. This account shall include the carrier's portion of revenue from the transmission between ship stations and land stations in the United States (including the revenue application to the land station) of messages at effective rates available to organizations engaged in publication of the substance of such messages. (See particularly § 34.3705; see also § 34.3735.)

§ 34.3399 Other message revenue. (a) This account shall include the carrier's portion of revenue from the transmission between ship stations and land stations in the United States (including the revenue application to the land station) of messages other than those provided for in §§ 34.3310 to 34.3325, inclusive.

(b) This account shall include, in a separate subdivision hereof, the carrier's portion of revenue from the transmission of messages between ship stations and points outside the United States

(i. e., messages that do not originate or terminate at, or transit through, the land stations within the United States).

§ 34.3700 Other transmission revenue. (a) This account, when maintained under the option provided in § 34.03-5 (a) shall include the carrier's portion of revenue from transmission services other than filed messages.

(b) This account shall be cleared on a monthly basis prior to entries herein for any succeeding month.

§ 34.3705 Scheduled transmission service revenue. This account shall include the carrier's portion of revenue from furnishing transmission facilities during specified periods, either with or without operators, to provide for direct communication by customers, for purposes other than broadcast-program or telephone transmission. (See also §§ 34.3725, 34.3755, and 34.3810.)

§ 34.3725 Broadcast-program service revenue. This account shall include the carrier's portion of revenue from the furnishing of services or facilities utilized in (a) broadcast-program transmission and (b) activities incidentally associated therewith.

§ 34.3735 News (CND) service revenue. This account shall include the carrier's portion of revenue from furnishing customers with reports of activities such as stock market transactions, sports events, etc., when such reports are prepared and disseminated by the carrier. This includes periodic charges for the facilities used in such dissemination such as tickers, projectors, etc.

§ 34.3745 Facsimile or photogram service revenue. This account shall include the carrier's portion of revenue from the transmission of any matter involving the use of facsimile or other reproducing equipment.

§ 34.3755 Telephone service revenue. This account shall include the carrier's portion of revenue from telephone operations when such operations involve the use of plant primarily devoted to radiotelegraph service. (See also § 34.03-8 and account 3910, "Telephone revenue—Telephone systems.")

§ 34.3799 Miscellaneous transmission service revenue. This account shall include the carrier's portion of revenue from transmission services not provided for elsewhere.

§ 34.3800 Nontransmission revenue. (a) This account, when maintained under the option provided in § 34.03-5 (a), shall include the carrier's portion of revenue from communication operations other than transmission.

(b) This account shall be cleared on a monthly basis prior to entries herein for any succeeding month.

§ 34.3805 Revenue from furnishing and servicing stations. (a) This account shall include the carrier's portion of periodic charges for equipment furnished radiotelegraph stations and revenue from installing, maintaining, inspecting, and servicing equipment, auditing and adjusting traffic accounts, and other similar services not connected with the transmission of messages or with merchandis-

ing, jobbing, or contract work rendered to radiotelegraph stations.

(b) This account shall be subdivided as follows:

- 3805:01 Fixed and land stations.
- 3805:02 Ship stations.
- 3805:03 Other mobile stations.

(c) The records supporting the entries in this account shall be so maintained as to show separately the amounts applicable to the following sources of revenue:

- (1) Installation subsequent to initial installation.
- (2) Servicing.
- (3) Rentals.
- (4) Clerical and administrative services.

(5) General service agreements not specifying the amounts applicable to the foregoing sources.

NOTE: Rental from plant comprising complete operating systems or operating units where the lessee has exclusive possession shall be included in account 5010, "Income from operated plant leased to others." (See also § 34.30-3.)

§ 34.3810 *Leased-circuit revenue.* This account shall include the carrier's portion of revenue from the use by others of circuits, channels, wires, cables, and similar facilities for direct communication by customers, when the charge

therefor is based on contractual rent agreements providing for definite periodic terms without regard to the extent of service obtained by the users of such facilities. (See also § 34.3705.)

NOTE A: Income from plant includible in account 1100, "Operated plant leased to others" (as distinguished from revenue includible in this account), shall be included in account 5010, "Income from operated plant leased to others."

NOTE B: When the charges for facilities furnished for direct communication by customers is based on the extent of services obtained by the users, such as telemeter service, the revenue shall be included in account 3705, "Scheduled transmission service revenue."

§ 34.3820 *Other leased-plant revenue.* This account shall include the carrier's portion of revenue from the use by others of leased operated plant not provided for elsewhere. (See also § 34.30-3 and account 3805, "Revenue from furnishing and servicing stations.")

§ 34.3835 *Money-order fees.* This account shall include the carrier's portion of revenue from charges for money-order service as distinguished from revenue messages incidental to such service.

NOTE: Revenue from money-order messages, as distinguished from the fees includible in this account, shall be included in the

appropriate message-revenue account. (See §§ 34.3110 to 34.3399.)

§ 34.3899 *Miscellaneous nontransmission revenue.* This account shall include the carrier's portion of revenue from nontransmission services not provided for elsewhere, such as revenue from frequency measuring, code registration, and errand service.

§ 34.3910 *Telephone revenue—Telephone systems.* This account shall include the carrier's revenue from the operation of telephone systems as provided in § 34.03-8. (See also account 3755, "Telephone service revenue.")

§ 34.3928 *Wire-telegraph and ocean-cable revenue—Wire systems.* This account shall include the carrier's revenue from the operation of wire-telegraph and ocean-cable systems as provided in § 34.03-8.

6. Make such editorial changes in the Commission's rules and regulations as may be necessary to reflect changes in cross-references to the sections of the Commission's rules and regulations herein amended, or to add cross-references with respect to new sections herein adopted.

[F. R. Doc. 49-5857; Filed, July 15, 1949; 9:00 a. m.]

NOTICES

FEDERAL COMMUNICATIONS COMMISSION

[Docket No. 9273]

RADIO STATION KTBS

ORDER CONTINUING HEARING

In re application of Radio Station KTBS, (KTBS), Shreveport, Louisiana, for modification of construction permit; Docket No. 9273, File No. BMP-3981.

At a session of the Federal Communications Commission held at its offices in Washington, D. C., on the 7th day of July 1949;

The Commission having under consideration a petition filed April 22, 1949, by Radio Station KTBS, Inc., requesting that its above-entitled application for modification of a construction permit which authorized operation of Station KTBS as a Class II station on 710 kc. to make changes in the directional antenna to increase the maximum expected operating values of the horizontal pattern toward the service area of Station WOR, New York, N. Y., be removed from the hearing docket and that action thereon be withheld pending final decision on the application (File No. BP-4575, Docket No. 9275) of Bamberger Broadcasting Service, Inc., licensee of Station WOR, New York, N. Y., a Class I-B station operating on 710 kc. for installation of a new directional antenna, for day and night use; and

It appearing, That petitioner alleges that there is serious conflict between its above-entitled application and the said application of Bamberger Broadcasting

Service, Inc.; that petitioner has no objection to the Commission considering the application of Bamberger Broadcasting Service, Inc. without giving consideration to petitioner's application; that in the event that the application of Bamberger Broadcasting Service, Inc. is granted petitioner will withdraw its application; and that in the event the application of Bamberger Broadcasting Service, Inc. is finally dismissed or denied, petitioner's application may be granted without hearing; and

It further appearing, that petitioner is in effect requesting that its above-entitled application be considered as contingent upon the final dismissal or denial of the said application of Bamberger Broadcasting Service, Inc.; and

It further appearing, that the Commission is not satisfied that the directional antenna proposed in the above-entitled application will in fact operate as predicted or that no interference will be caused to the existing service area of Station WOR; and that, for this reason among others, the Commission is unable to conclude that a grant of the above-entitled application would serve public interest, convenience, and necessity even in the event that the said application of Bamberger Broadcasting Service, Inc., is dismissed or denied;

It is ordered, That the said petition of Radio Station KTBS, Inc., insofar as it requests removal of the above-entitled application from the hearing docket, is denied and, insofar as it requests that action on the above-entitled application be withheld, is granted; and

It is further ordered, That the hearing in the above-entitled proceeding, now scheduled for July 21, 1949, is continued indefinitely pending final disposition of the application of Bamberger Broadcasting Service, Inc., File No. BP-4575, Docket No. 9275.

FEDERAL COMMUNICATIONS COMMISSION,

[SEAL] T. J. SLOWIE,
Secretary.

[Docket No. 9373]

GREYLOCK BROADCASTING CO. (WBRK)
ORDER DESIGNATING APPLICATION FOR HEARING ON STATED ISSUES

In re application of Greylock Broadcasting Company (WBRK), Pittsfield, Massachusetts, for construction permit; Docket No. 9373, File No. BP-6535.

At a session of the Federal Communications Commission, held at its offices in Washington, D. C., on the 7th day of July 1949;

The Commission having under consideration the above-entitled application for a construction permit to change the facilities of Station WBRK, Pittsfield, Massachusetts, from frequency 1340 kilocycles, 250 watts power, unlimited time to frequency 610 kilocycles, 1 kilowatt power, unlimited time; to install directional antenna for day and night use; to install new transmitter; and to change transmitter location;

It appearing, that the applicant is legally, technically, financially, and otherwise qualified to operate Station WBRK as proposed, but that the application may involve interference with one or more existing stations and otherwise not comply with the Standards of Good Engineering Practice;

It is ordered, That, pursuant to section 309 (a) of the Communications Act of 1934, as amended, the said application is designated for hearing at a time and place to be designated by subsequent order of the Commission, upon the following issues:

1. To determine the areas and populations which may be expected to gain or lose primary service from the operation of Station WBRK as proposed and the character of other broadcast service available to those areas and populations.

2. To determine whether the operation of Station WBRK as proposed would involve objectionable interference with Stations WROW, Albany, New York, WIP, Philadelphia, Pennsylvania, or with any other existing broadcast station and, if so, the nature and extent thereof, the areas and populations affected thereby, and the availability of other broadcast service to such areas and populations.

3. To determine whether the operation of Station WBRK as proposed would involve objectionable interference with the services proposed in any other pending applications for broadcast facilities and, if so, the nature and extent thereof, the areas and populations affected thereby, and the availability of other broadcast service to such areas and populations.

4. To determine whether the installation and operation of Station WBRK as proposed would be in compliance with the Commission's Rules and Standards of Good Engineering Practice Concerning Standard Broadcast Stations with particular reference as to whether the 2 mv/m contour of the proposed operation would overlap the 25 mv/m contour of Station WROW, Albany, New York.

It is further ordered, That, Hudson Valley Broadcasting Company, Incorporated, licensee of Station WROW, Albany, New York and Pennsylvania Broadcasting Company, licensee of Station WIP, Philadelphia, Pennsylvania are made parties to the proceeding.

FEDERAL COMMUNICATIONS
COMMISSION,

[SEAL] T. J. SLOWIE,
Secretary.

[Docket Nos. 9371, 9372]

GEORGE R. WINSTON AND DOYLE E.
COLLUP (KSTV)

ORDER DESIGNATING APPLICATION FOR CONSOLIDATED HEARING ON STATED ISSUES

In the matter of the application of George R. Winston, Cisco, Texas, Docket No. 9371, File No. BP-7018; Doyle E. Collup (KSTV), Stephenville, Texas, Docket No. 9372, File No. BP-7078; for construction permits.

At a session of the Federal Communications Commission, held at its offices in

No. 136—6

Washington, D. C., on the 7th day of July 1949;

The Commission having under consideration the above-entitled applications of George R. Winston for a construction permit for a new standard broadcast station to operate on the frequency 1250 kilocycles, 250 watts power, daytime only at Cisco, Texas and of Doyle E. Collup for a construction permit to change the facilities of station KSTV, Stephenville, Texas from 1510 kilocycles, 250 watts power, daytime only to 1240 kilocycles, 250 watts power, unlimited time;

It is ordered, That, pursuant to section 309 (a) of the Communications Act of 1934, as amended, the said applications are designated for hearing in a consolidated proceeding at a time and place to be designated by subsequent order of the Commission, upon the following issues:

1. To determine the legal, financial, technical and other qualifications of applicant George R. Winston to construct and operate the proposed station and the financial, technical and other qualifications of applicant Doyle E. Collup, to construct and operate station KSTV as proposed.

2. To determine the areas and populations which may be expected to gain or lose primary service from the operation of the proposed station and station KSTV as proposed and the character of other broadcast service available to those areas and populations.

3. To determine the type and character of program service proposed to be rendered and whether it would meet the requirements of the populations and areas proposed to be served.

4. To determine whether the operation of station KSTV as proposed would involve objectionable interference with stations KXOX, Sweetwater, Texas; KORA, Bryan, Texas; KVSO, Ardmore, Oklahoma and KWTX, Waco, Texas and whether the proposed station and station KXTV as proposed would involve objectionable interference with any other existing broadcast stations, and if so, the nature and extent thereof, the areas and populations affected thereby, and the availability of other broadcast service to such areas and populations.

5. To determine whether the proposed operation and station KSTV as proposed would involve objectionable interference with the services proposed by each other or with the services proposed in any other pending applications for broadcast facilities and, if so, the nature and extent thereof, the areas and populations affected thereby, and the availability of other broadcast service to such areas and populations.

6. To determine whether the installation and operation of the proposed station and station KSTV as proposed would be in compliance with the Commission's rules and Standards of Good Engineering Practice Concerning Standard Broadcast Stations with particular reference as to whether the installation and operation of the proposed station would meet the minimum requirements for the operation of a Class IV station on a Class III channel, as specified in Part I of the

afore-mentioned Standards of Good Engineering Practice.

7. To determine on a comparative basis, which, if either, of the applications in this consolidated proceeding should be granted.

It is further ordered, That, Sweetwater Radio Inc., licensee of station KXOX, Sweetwater, Texas; Bryan Broadcasting Company, licensee of station KORA, Bryan, Texas; John F. Easley, licensee of stations KVSO, Ardmore, Oklahoma, and KWTX Broadcasting Company, licensee of station KWTX, Waco, Texas, are made parties to the proceeding.

FEDERAL COMMUNICATIONS
COMMISSION,

[SEAL] T. J. SLOWIE,
Secretary.

[Docket Nos. 8202, 9374]

METROPOLITAN BROADCASTING CO. OF MILWAUKEE AND BELLE CITY BROADCASTING CO.

ORDER DESIGNATING APPLICATION FOR CONSOLIDATED HEARING ON STATED ISSUES

In re Applications of Metropolitan Broadcasting Company of Milwaukee, Milwaukee, Wisconsin, Docket No. 8202, File No. BP-5755; Belle City Broadcasting Company, Racine, Wisconsin, Docket No. 9374, File No. BP-7257; for construction permits.

At a session of the Federal Communications Commission, held at its offices in Washington, D. C., on the 7th day of July 1949;

The Commission having under consideration the above entitled applications of Metropolitan Broadcasting Company which requests a permit to construct a new standard broadcast station to operate on the frequency 1470 kilocycles, with 500 watts power, daytime only at Milwaukee, Wisconsin and of Belle City Broadcasting Company which requests a permit to construct a new standard broadcast station to operate on the frequency 1460 kilocycles, with 500 watts power, daytime only at Racine, Wisconsin;

It is ordered, That, pursuant to section 309 (a) of the Communications Act of 1934, as amended, the said applications are designated for hearing in a consolidated proceeding to begin on July 27, 1949 at Washington, D. C., upon the following issues:

1. To determine the legal, technical, financial, and other qualifications of the applicant corporations, their officers, directors and stockholders to construct and operate the proposed stations.

2. To determine the areas and populations which may be expected to gain or lose primary service from the operation of the proposed stations and the character of other broadcast service available to those areas and populations.

3. To determine the type and character of program service proposed to be rendered and whether it would meet the requirements of the populations and areas proposed to be served.

4. To determine whether the operation of the proposed stations would involve objectionable interference with any existing broadcast stations and, if so, the nature and extent thereof, the areas and populations affected thereby, and the availability of other broadcast service to such areas and populations.

5. To determine whether the operation of the proposed stations would involve objectionable interference each with the other or with the services proposed in any other pending applications for broadcast facilities and, if so, the nature and extent thereof, the areas and populations affected thereby and the availability of other broadcast service to such areas and populations.

6. To determine whether the installation and operation of the proposed stations would be in compliance with the Commission's rules and Standards of Good Engineering Practice Concerning Standard Broadcast Stations.

7. To determine the overlap, if any, that will exist between the service areas of the proposed station of Belle City Broadcasting Company and of Station WMIL, Milwaukee, Wisconsin, the nature and extent thereof, and whether such overlap, if any, is in contravention of § 3.35 of the Commission's rules.

8. To determine on a comparative basis which, if either, of the applications in this consolidated proceeding should be granted.

FEDERAL COMMUNICATIONS
COMMISSION,

[SEAL] T. J. SLOWIE,
Secretary.

[F. R. Doc. 49-5866; Filed, July 15, 1949;
9:02 a. m.]

SCHEDULE OF HEARINGS FOR AUGUST AND SEPTEMBER, 1949

JULY 11, 1949.

The Commission released today a hearing schedule for all standard and FM broadcast applications designated for hearing subsequent to March 25, 1949, and prior to June 24, 1949. The schedule is composed of two parts. Part I contains an alphabetical list of all the applications scheduled for hearing. In Part I the applications that are to be heard in the field are marked with an "(F)" after the date, all others are to be heard in Washington. Part II is a chronological list of hearings containing first the list of hearings to be held in the field and second the hearings to be held in Washington, D. C.

In accordance with established practice, the hearings in the District of Columbia will be heard in order of docket numbers, the lowest docket number being heard first. Certain hearings which have heretofore been continued to dates in August and September have not been included in this calendar.

FEDERAL COMMUNICATIONS
COMMISSION,

[SEAL] T. J. SLOWIE,
Secretary.

[Docket No. 8379]

TRIBUNE BUILDING CO. (KLX)

ORDER DELETING ISSUES

In re application of Tribune Building Company (KLX), Oakland, California, for construction permit; Docket No. 8379, File No. BP-5293.

At a session of the Federal Communications Commission, held at its offices in Washington, D. C., on the 7th day of July 1949;

The Commission having under consideration a petition filed by Tribune Building Company for removal from the hearing docket, leave to amend, and reconsideration and grant of its above-entitled application for a construction permit to increase the power of Station KLX, Oakland, California, from 1 kilowatt to 5 kilowatts, to install a new transmitter, to change location, and to install a directional antenna;

It appearing, that the Commission by order dated January 31, 1948, designated the above-entitled application for hearing and made Salt Lake City Broadcasting Company, Incorporated, licensee of Station KALL, and Vancouver Radio Corporation, licensee of Station KVAN parties to the proceeding; and

It further appearing, that, on the basis of information submitted with the instant petition the proposed operation of Tribune Building Company would not cause objectionable interference to the services proposed in any pending application and would not cause additional interference to any existing station and that, on the basis of information contained in the application of Tribune Building Company it is technically, financially and otherwise qualified to construct and operate Station KLX as proposed and that, the type and character of program service proposed to be rendered would meet the requirements of the populations and areas proposed to be served; and

It further appearing, that, the operation of Station KLX as proposed may degrade the service presently rendered to the city of Oakland, California;

It is ordered, That, the said petition of Tribune Building Company is denied and that on the Commission's own motion its order of January 31, 1948, designating the above-entitled application for hearing is amended to show deletion of issues 1 and 3 therefrom and to remove Salt Lake City Broadcasting Company, Incorporated, licensee of Station KALL and Vancouver Radio Corporation, licensee of Station KVAN as parties to the proceeding; and

It is further ordered, That hearing on the above-entitled matters is scheduled to begin on August 5, 1949, at Washington, D. C.

[Docket No. 8466]

LAKES AREA BROADCASTING CO.

ORDER DESIGNATING APPLICATION FOR
HEARING ON STATED ISSUES

In re application of L. L. Gaffaney and J. B. Smith d/b as Lakes Area Broadcasting Company, Pryor, Oklahoma, for construction permit; Docket No. 8466, File No. BP-5752.

At a session of the Federal Communications Commission, held at its offices in Washington, D. C., on the 7th day of July 1949;

The Commission having under consideration the above-entitled application requesting a permit to construct a new standard broadcast station to operate on frequency 1570 kilocycles, with 250 watts power, daytime only in Pryor, Oklahoma;

It appearing, that the applicant is legally, technically, financially, and otherwise qualified to operate the proposed station, but that the application may not comply with the Standards of Good Engineering Practice with particular reference to the proposed transmitter location and the population residing within the blanket contours;

It is ordered, That, pursuant to section 309 (a) of the Communications Act of 1934, as amended, the said application is designated for hearing at a time and place to be designated by subsequent order of the Commission, upon the following issues:

1. To determine the areas and populations which may be expected to gain or lose primary service from the operation of the proposed station and the character of other broadcast service available to those areas and populations.

2. To determine whether the operation of the proposed station would involve objectionable interference with any existing broadcast stations and, if so, the nature and extent thereof, the areas and populations affected thereby, and the availability of other broadcast service to such areas and populations.

3. To determine whether the operation of the proposed station would involve objectionable interference with the service proposed in any other pending applications for broadcast facilities and, if so, the nature and extent thereof, the areas and populations affected thereby, and the availability of other broadcast service to such areas and populations.

4. To determine whether the installation and operation of the proposed station would be in compliance with the Commission's rules and Standards of Good Engineering Practice Concerning Standard Broadcast Stations with particular reference to the proposed transmitter location and the population residing within the 500 mv/m and 250 mv/m blanket contours.

[Docket No. 8614, 9331]

ELECTRONICS CORP. OF PUERTO RICO
(WECW)ORDER DESIGNATING APPLICATION FOR CON-
SOLIDATED HEARING ON STATED ISSUES

In re applications of Electronics Corporation of Puerto Rico (WECW), Mayaguez, Puerto Rico, for renewal of license of Station WECW, Docket No. 9331, File No. BR-1393; and for a construction permit, Docket No. 8614, File No. BP-6357.

At a session of the Federal Communications Commission, held at its offices in Washington, D. C., on the 7th day of July 1949;

The Commission having under consideration the above-entitled application of Electronics Corporation of Puerto Rico to change the facilities of Station WECW, Mayaguez, Puerto Rico, from 1490 kc., 250 w, unlimited time to 1300 kc, 1 kw, unlimited time and install new transmitting equipment;

It appearing, that the Commission on May 25, 1949, designated for hearing the above-entitled application of Electronics Corporation of Puerto Rico for renewal of license of AM broadcast station WECW, at Mayaguez, Puerto Rico;

It is ordered, That, pursuant to section 309 (a) of the Communications Act of 1934, as amended, the above-entitled application of Electronics Corporation of Puerto Rico for a construction permit is designated for hearing in consolidation with aforesaid renewal application at a time and place to be designated by subsequent order of the Commission, upon the following issues:

1. To determine the technical, financial, and other qualifications of the applicant corporation, its officers, directors and stockholders to construct and operate the station as proposed.

2. To determine the areas and populations which may be expected to gain primary service from the operation of Station WECW as proposed and the character of other broadcast service available to those areas and populations.

3. To determine the type and character of program service proposed to be rendered and whether it would meet the requirements of the populations and areas proposed to be served.

4. To determine whether the operation of the station as proposed would involve objectionable interference with any existing broadcast stations and if so, the nature and extent thereof, the areas and populations affected thereby, and the availability of other broadcast service to such areas and populations.

5. To determine whether the operation of the station as proposed would involve objectionable interference with the services proposed in any pending applications for broadcast facilities and, if so, the nature and extent thereof, the areas and populations affected thereby and the availability of other broadcast service to such areas and populations.

6. To determine whether the installation and operation of Station WECW as proposed would be in compliance with the Commission's rules and Standards of Good Engineering Practice Concerning Standard Broadcast Stations.

7. To determine if either of the applications in this consolidated proceeding should be granted.

It is further ordered, That the Commission's Order of May 25, 1949, designating for hearing the above-entitled application of Electronics Corporation of Puerto Rico, for renewal of license of Station WCCW, Mayaguez, Puerto Rico, is amended to include the above-entitled application of Electronics Corporation of Puerto Rico for a construction permit.

ORGANIZATION AND DELEGATIONS OF AUTHORITY

In the matter of organizational and editorial amendments to the Commission's statement of organization and the Commission's statement of delegations of authority.

At a session of the Federal Communications Commission, held at its offices in Washington, D. C., on the 29th day of June 1949:

The Commission, having under consideration the necessity for amending the statement of organization of the Commission and its statement of delegations of authority, to reflect changes in internal procedures of the Commission relating to the processing and disposition of applications filed under Parts 10, 11, 16 and 19; and

It appearing, that such amendments are designed to improve the internal administration of the Commission and will serve the public interest, convenience, and necessity; and

It further appearing, that the proposed amendments to the rules and regulations are organizational or editorial in nature, and that publication of the notice of proposed rule making pursuant to section 4 (a) of the Administrative Procedure Act is not required; and

It further appearing, that authority for the proposed amendments is contained in section 4 (i) and section 5 (e) of the Communications Act of 1934, as amended;

It is ordered, That, effective July 1, 1949 the Commission's statement of organization and delegations of authority of the Commission's rules and regulations, be, and are hereby, amended, as set forth below.

Released: June 30, 1949.

FEDERAL COMMUNICATIONS
COMMISSION,
[SEAL] T. J. SLOWIE,
Secretary.

Item 1. Amend § 0.26 to read as follows:

SEC. 0.26 *Public Safety and Special Services Division.* The Public Safety and Special Services Division is divided into the following branches:

(a) Public Safety Services Branch, which is responsible for the engineering

aspects of the police, fire, forestry-conservation, highway maintenance, and special emergency radio services. With regard to these services, participates in processing of applications for authority to construct, operate, and modify radio-communication and radio control systems; studies progress in pertinent fields of the radio art; recommends technical and operating standards; makes studies of frequency utilization; consults with industry advisory groups and appropriate staff elements concerning the general availability and use of frequencies; prepares frequency assignment patterns; makes recommendations concerning international arrangements designed to reduce radio interference to and from other countries; prepares exhibits and participates in hearings; participates in preparation, interpretation, revision, enforcement, and administration of the rules and regulations affecting the Public Safety Radio Services.

(b) Industrial Radio Services Branch, which is responsible for the engineering aspects of the power, petroleum, forest products, relay press, motion picture, special industrial, and low power industrial radio services. With regard to these services, participates in processing of applications for authority to construct, operate, and modify radio communication and radio control systems; studies progress in pertinent fields of the radio art; recommends technical and operating standards; makes studies of frequency utilization; consults with industry advisory groups and appropriate staff elements concerning the general availability and use of frequencies; prepares frequency assignment patterns; makes recommendations concerning international arrangements designed to reduce radio interference to and from other countries; prepares exhibits and participates in hearings; participates in preparation, interpretation, revision, enforcement, and administration of the rules and regulations affecting the Industrial Radio Services.

(c) Land Transportation Services Branch, which is responsible for the engineering aspects of the inter-city bus, highway truck, railroad, taxicab, urban transit, and automobile emergency radio services. With regard to these services, participates in processing of applications for authority to construct, operate, and modify radiocommunication and radio control systems; studies progress in pertinent fields of the radio art; recommends technical and operating standards; makes studies of frequency utilization; consults with industry advisory groups and appropriate staff elements concerning the general availability and use of frequencies; prepares frequency assignment patterns; makes recommendations concerning international arrangements designed to reduce radio interference to and from other countries; prepares exhibits and participates in hearings; participates in preparation, interpretation, revision, enforcement, and administration of the rules and regulations affecting the Land Transportation Radio Services.

(d) Experimental and Miscellaneous Services Branch, which is responsible for the engineering aspects pertaining to the

development and coordination of equipment and research programs. With regard to these experimental and research programs, participates in processing of applications for authority to construct, operate, and modify experimental stations; recommends technical and operating standards; makes recommendations concerning international arrangements designed to reduce radio interference to and from other countries; prepare engineering exhibits and participates in hearings; participates in preparation, interpretation, revision, enforcement, and administration of the rules and regulations affecting the Experimental Radio Services; provides expert advice on results obtained by experimentation relative to the establishment of new services. This branch is also responsible for administration of all matters pertaining to industrial heaters, medical diathermy and miscellaneous types of apparatus which use radio-frequency energy for heating, ionization of gases, or other purposes in which the action of the energy emitted is directly upon the work load and does not involve the use of associated radio receiving equipment.

Item 2. In section 0.76, amend paragraph (a) to read as follows:

(a) Aviation and Land Transportation Branch, which reviews and prepares legal opinions, reports, and recommendations with respect to radio station applications and authorizations in the aviation service and the land transportation radio services, the latter of which includes railroad, urban transit, inter-city bus, highway truck and taxicab radio services, in both the established and developmental stages; reviews and makes recommendations with respect to formal and informal petitions and complaints; conducts investigations and hearings with respect to these services; drafts proposed legislative amendments and prepares Commission reports, orders, rules, and regulations affecting these services.

Item 3. In section 0.76, amend paragraph (c) to read as follows:

(c) Public Safety, Experimental, and Industrial Branch, which reviews and prepares legal opinions, reports, and recommendations with respect to applications for radio station authorizations in the Public Safety, Industrial, Experimental (other than those involving common carrier experimental operations) and Citizens Radio Services, and the Industrial Scientific and Medical Services, in both the established and developmental stages; reviews and makes recommendations with respect to formal and informal petitions and complaints; conducts investigations and hearings with respect to these services; drafts proposed legislative amendments and prepares Commission reports, orders, rules, and regulations affecting these services.

Item 4. In section 0.141, amend paragraph (g) to read as follows:

(g) Except for specific applications or classes thereof concerning which the Bureau of Engineering or the Bureau of Law shall notify the Secretary, applica-

tions for license or modification of license to cover construction permits, other than those for stations rendering a common carrier service (except those listed in subparagraph (5) of this paragraph) where the permittee has complied with all the terms of the construction permit and no additional authority not covered by the permit is requested, in the following categories of cases:

- (1) All Class 1 experimental stations and Class 2 experimental stations in established services.
- (2) All classes of stations in the Aviation Services.
- (3) All classes of stations in the Public Safety Services.
- (4) All classes of stations in the Industrial Services.
- (5) All classes of stations in the Public Coastal and Fixed Public Services in Alaska.
- (6) All classes of stations in the Land Transportation Services.

Item 5. In section 0.141, amend paragraph (h) to read as follows:

(h) Except for specific applications or classes thereof concerning which the Bureau of Engineering or the Bureau of Law shall notify the Secretary, all applications for renewal of licenses, other than those for stations rendering a common carrier service (except those listed in subparagraph (5) of this paragraph), where the renewal is in accordance with the terms of the previous license, in the following categories of cases:

- (1) All classes of stations in the Ship Service.
- (2) All classes of stations in the Aviation Services.
- (3) All classes of stations in the Public Safety Services.
- (4) All classes of stations in the Industrial Services.
- (5) Stations in the Alaskan Coastal and Alaskan Fixed Public Service.
- (6) All classes of stations in the Land Transportation Radio Services.
- (7) All classes of stations in the Citizens Radio Service.

Item 6. In section 0.141, amend paragraph (j) to read as follows:

(j) Except for specific applications or classes thereof concerning which the Bureau of Engineering or the Bureau of Law shall notify the Secretary, applications for extension of the expiration date of construction permits, in the following categories of cases:

- (1) All Class 1 experimental stations and all Class 2 experimental stations operating established services.
- (2) All classes of stations in the Aviation Services.
- (3) All classes of stations in the Public Safety Services.
- (4) All classes of stations in the Industrial Services.
- (5) All classes of stations in the Public Coastal and Fixed Public Service in Alaska.
- (6) All classes of stations in the Land Transportation Radio Services.

Item 7. In section 0.141, paragraphs (k) and (l):

- a. Delete paragraph (l);

b. Reletter paragraph (k) to be paragraph (l);

c. Insert new paragraph (k) as follows:

(k) Except for specific applications or classes thereof concerning which the Bureau of Engineering or the Bureau of Law shall notify the Secretary, applications for extension of the period of equipment and service tests in the following categories of cases:

- (1) All classes of stations in the Aviation Service.
- (2) All classes of stations in the Experimental Service.
- (3) All classes of stations in the Public Coastal and Fixed Public Services in Alaska.

Item 8. In section 0.142, amend paragraph (e) to read as follows:

(e) Applications which involve only a change in location, type model, design, or number of transmitters, except applications involving stations in the broadcast services, applications falling under section 0.141, and except for specific applications or classes thereof concerning which the Bureau of Law shall notify the Secretary.

Item 9. In section 0.142 add paragraph (j) to read as follows:

(j) Applications which involve a change in frequency, power, or emission, except applications involving stations in the broadcast and common carrier services, and except for specific applications or classes thereof concerning which the Bureau of Law shall notify the Secretary.

Item 10. In section 0.143, add paragraph (i) to read as follows:

(i) Applications for consent to assignment and transfer of control of station authorizations in the following categories of cases:

- (1) All Class 1 experimental stations and all Class 2 experimental stations operating in established services.
- (2) All classes of stations in the Aviation Service.
- (3) All classes of stations in the Public Safety Services.
- (4) All classes of stations in the Industrial Services.
- (5) All classes of stations in the Land Transportation Radio Services.

Item 11. In section 0.144, amend paragraph (a) to read as follows:

(a) Applications for the Public Safety, Ship, Industrial, Land Transportation, and Citizens Radio Services, except those rendering a common carrier service and those falling under sections 0.141, 0.142 and 0.143.

Item 12. In section 0.144, amend paragraph (b) to read as follows:

(b) Applications for Class 1 and Class 2 experimental station authorizations and all applications for Class 2 experimental stations in established services and radar navigational aid stations except (1) those falling under sections 0.121 and 0.141, and (2) those proposing to render common carrier or broadcast service.

Item 13. Renumber present sections 0.214 and 0.215 as 0.215 and 0.216 respectively.

Item 14. Insert as § 0.214:

Sec. 0.214 *Citizens radio applications.* Applications for authorization in the Citizens Radio Service should be submitted to the Commission's Washington, D. C. office, except where the equipment for which authorization is sought bears an FCC type-approval number, in which event such applications may be filed with the nearest engineering field office listed in section 0.40.

FEDERAL POWER COMMISSION

[Docket No. G-1161]

TENNESSEE GAS TRANSMISSION CO.

NOTICE OF FINAL DECISION AND ORDER

JULY 11, 1949.

Notice is hereby given that the initial decision and order allowing First Revised Sheets Nos. 3, 6, 9, and 31 and Second Revised Sheet No. 33 and Original Revised Sheet No. 33-A of FPC Gas Schedules of Tennessee Gas Transmission Company to take effect as of June 1, 1949, was issued and served upon all parties on June 10, 1949.

No exception thereto having been filed or review initiated by the Commission, said initial decision, in conformity with the Commission's rules of practice and procedure, became effective on July 11, 1949, as the final decision and order of the Commission.

[SEAL] LEON M. FUQUAY,
Secretary.

[F. R. Doc. 49-5810; Filed, July 15, 1949; 8:50 a. m.]

[Docket No. G-1217]

COLORADO-WYOMING GAS CO.

ORDER FIXING DATE OF HEARING

On June 3, 1949, Colorado-Wyoming Gas Company (Applicant) filed an application for a certificate of public convenience and necessity, pursuant to section 7 of the Natural Gas Act, as amended, authorizing the installation and operation of two additional 600 H. P. compressor units at Applicant's Mesa Compressor Station located in Adams County, Colorado, all as more fully described in such application on file with the Commission and open to public inspection.

Applicant has requested that its application be heard under the shortened procedure provided by § 1.32 (b) of the Commission's rules of practice and procedure; and no request to be heard or protest has been filed subsequent to the giving of due notice of the filing of the application, including publication in the FEDERAL REGISTER on June 16, 1949 (14 F. R. 3268).

The Commission finds: This proceeding is a proper one for disposition under the provisions of § 1.32 (b) of the Commission's rules of practice and procedure.

The Commission orders: (A) Pursuant to the authority contained in and subject to the jurisdiction conferred upon the Federal Power Commission by sections 7 and 15 of the Natural Gas Act, as amended, and the Commission's rules of practice and procedure, a hearing be held on August 10, 1949, at 9:30 a. m. (e. d. s. t.), in the Hearing Room of the Federal Power Commission, 1800 Pennsylvania Avenue, N. W., Washington, D. C., concerning the matters involved and the issues presented by such application: *Provided, however*, That the Commission may, after a non-contested hearing, forthwith dispose of the proceeding pursuant to the provisions of § 1.32 of the Commission's rules of practice and procedure.

(B) Interested State commissions may participate as provided by §§ 1.8 and 1.37 (f) of the said rules of practice and procedure.

Date of issuance: July 12, 1949.

By the Commission.

[SEAL] LEON M. FUQUAY,
Secretary.

[F. R. Doc. 49-5809; Filed, July 15, 1949;

[Docket No. G-1234]

TENNESSEE GAS TRANSMISSION CO.

NOTICE OF APPLICATION

JULY 12, 1949.

Take notice that Tennessee Gas Transmission Company (Applicant), a Delaware corporation, having its principal place of business in the Commerce Building, Houston, Texas, filed on July 5, 1949, an application for a certificate of public convenience and necessity pursuant to section 7 of the Natural Gas Act, authorizing the construction and operation of certain transmission pipe line facilities hereinafter described.

Applicant proposes to transport and sell natural gas to the Town of Dickson, Tennessee, for resale in Dickson, and for such purpose to construct and operate a sales meter station on its main 24-inch gas transmission line near Dickson, Tennessee, to provide an estimated maximum daily delivery capacity of approximately 1,700,000 cubic feet, pursuant to the terms of a contract entered into between Applicant and the Town of Dickson, Tennessee, on April 4, 1949. Minimum daily demands are estimated at 150,000 cubic feet with first year annual requirements of approximately 70,000,000 cubic feet.

The estimated cost of the proposed facilities is approximately \$3,000, all of which the Applicant proposes to finance out of cash on hand.

Protests or petitions to intervene may be filed with the Federal Power Commission, Washington 25, D. C., in accordance with the rules of practice and procedure within 15 days from the date of publication hereof in the FEDERAL REGISTER. The application is on file with the Commission for public inspection.

[Docket No. G-1240]

PANHANDLE EASTERN PIPE LINE CO.

ORDER SUSPENDING TARIFF AND FIXING DATE OF HEARING

JULY 12, 1949.

On June 15, 1949, Panhandle Eastern Pipe Line Company (Panhandle) filed with this Commission its FPC Gas Tariff, Original Volume No. 1, pursuant to Part 154 of the Commission's general rules and regulations, which is proposed to be made effective as of July 15, 1949.

Concurrently with the filing of its Tariff, Panhandle also filed with the Commission statements required by § 154.85 of the Commission's general rules and regulations identifying the provisions of contracts now filed as effective rate schedules which would be continued in effect as executed service agreements and which would not be superseded by, or in conflict with other applicable provisions of the Rate Schedules and General Terms and Conditions of the Tariff.

A copy of the relevant statement with respect to contracts on file with the Commission as rate schedules, was trans-

mitted by Panhandle to each of its customers and to interested State commissions.

Numerous protests to the Tariff and the statements submitted pursuant to § 154.85 of the rules and regulations have been received by the Commission from Panhandle's customers and from State regulatory commissions.

Among the points of objection made to the Tariff and the restatement of contracts by Panhandle's customers and State commissions are included the following:

(1) The "Priority and Curtailment of Service" provisions (Paragraph 8 of General Terms and Conditions). The protestants allege that the service rules proposed by Panhandle are unreasonable and discriminatory.

(2) The limitation upon the allowable volumes of interruptible gas (Original Sheet No. 46) and maximum allowable daily volumes (Original Sheets, 47 and 48), particularly with respect to the introduction into the Tariff of provisions with respect to the limitation upon the volumes of gas Panhandle would be obligated to deliver to so-called "entire requirements" customers.

(3) The "Service Agreement" provision (section 16 of General Terms and Conditions) particularly with respect to the requirement that a service agreement must be executed in order that a utility be eligible for any increases in the maximum daily volume of gas provided for in, and as limited by, the Tariff.

(4) Form of Service Agreement-Firm (Original Sheets Nos. 35 through 40), particularly with respect to the establishment of volumetric limitations on a daily and monthly basis; establishment of a minimum "take or pay for" provision, which it is alleged, is inconsistent with the rate schedule provisions; and the establishment of price adjustment clauses to reflect increases in the cost of purchased gas and increases in certain taxes. It is further alleged by some of the protestants that the contemplated volumetric limitations would restrict the ability of utilities to improve load factors and earn a better average rate by increasing the sale of summer gas and would change the service characteristics which may lead to an increase in rates.

(5) The forms of Service Agreement-Interruptible (Original Sheets 41 through 43) particularly with respect to the limitation of deliveries on the basis of average daily normal requirements rather than on the basis of maximum daily requirements.

(6) The omission of certain contract provisions from statements submitted pursuant to § 154.85 of the rules and regulations.

(7) The failure to file statements with respect to certain contracts now on file with the Commission as rate schedules.

(8) The imposition of limitations upon the volumes of gas to be delivered by Panhandle to so-called "entire requirements" customers below estimated requirements while providing for full contract deliveries to so-called "partial requirements" customers.

(9) The allocation of gas under the Tariff does not give effect to increased

capacity which will be available during the winter 1949-1950, and the Tariff contains no rules under which maximum allowable daily volumes of gas for each utility would be increased in proportion to increases in Panhandle's pipe line capacity.

(10) Paragraph 8.2 (Original Sheet No. 31) allowing a minimum of 10% of normal requirements to interruptible customers under Step 3 of Curtailment, it is alleged, conflicts with Paragraph 2 (e) (Original Sheets 16, 19 and 22) of Rate Schedules I-1, I-2 and I-3.

(11) It is alleged that because of the limitation imposed by the Tariff on the maximum allowable volume of firm gas to each utility there should be excluded from the Tariff provisions relating to firm gas service to utilities for resale to any individual customer whose present or estimated annual use of gas exceeds 1,200,000 therms unless such gas requirements were purchased by the Utility from Panhandle on a firm basis prior to October 1, 1945.

The proposed changes in Panhandle's rate schedules now on file with this Commission as Tariff, Original Volume No. 1, and in the statements filed concurrently therewith pursuant to § 154.85 of the Commission's general rules and regulations may be unjust, unreasonable, unduly discriminatory, or preferential, and may result in undue burden upon the utilities purchasing natural gas from Panhandle and upon the consumers served by such utilities.

The Commission finds: It is necessary and proper in the public interest and to aid in the enforcement of the provisions of the Natural Gas Act that the Commission enter upon a hearing, pursuant to Section 4 of the Natural Gas Act, concerning the lawfulness of Panhandle's said proposed FPC Gas Tariff, Original Volume No. 1, and the statements filed concurrently therewith pursuant to § 154.85 of the Commission's General Rules and Regulations referred to above, and that the Tariff and statements be suspended as hereinafter provided and use thereof be deferred pending hearing and decision thereon.

The Commission orders:

(A) A public hearing be held commencing on August 22, 1949, at 10:00 a. m. e. d. s. t. in the Hearing Room of the Federal Power Commission, 1800 Pennsylvania Avenue, N. W., Washington, D. C., concerning the lawfulness of the proposed FPC Gas Tariff, Original Volume No. 1, and the statements filed pursuant to § 154.85 of the Commission's general rules and regulations filed by Panhandle Eastern Pipe Line Company.

(B) Pending such hearing and decision thereon said Tariff and statements filed by Panhandle Eastern Pipe Line Company on June 15, 1949, be and they hereby are suspended and the use thereof is deferred until December 15, 1949, and until such further time thereafter as such tariff and statements may be made effective in the manner prescribed by the Natural Gas Act.

(C) Protestants desiring to become interveners in the proceeding shall file petitions in accordance with § 1.8 of the Commission rules of practice and procedure in which petitions there shall be

set forth with particularity the nature of the petitioner's specific objections to Panhandle's proposed FPC Gas Tariff and statements filed concurrently therewith together with suggested revisions thereof.

(D) Interested State commissions may participate as provided by §§ 1.8 and 1.37 (f) of the Commission's rules of practice and procedure.

Date of issuance: July 13, 1949.

By the Commission.

[SEAL]

LEON M. FUQUAY,
Secretary.

8:51 a. m.]

SECURITIES AND EXCHANGE COMMISSION

[File No. 54-178]

UNITED LIGHT AND RAILWAYS CO. ET AL. NOTICE OF FILING AND NOTICE OF AN ORDER FOR HEARING

At a regular session of the Securities and Exchange Commission held at its office in the city of Washington, D. C., on the 12th day of July A. D. 1949.

Notice is hereby given that The United Light and Railways Company ("Railways"), a registered holding company, and its subsidiary holding company, Continental Gas and Electric Corporation ("Continental"), have filed with this Commission a joint application for the approval of a plan filed pursuant to section 11 (e) of the Public Utility Holding Company Act of 1935 ("act"), providing for their liquidation and dissolution.

Kansas City Power & Light Company ("Kansas City"), Iowa Power and Light Company ("Iowa Power"), St. Joseph Light & Power Company ("St. Joseph"), Iowa-Illinois Gas and Electric Company ("Iowa-Illinois"), Eastern Kansas Utilities, Inc. ("Eastern Kansas") and The United Light and Railways Service Company ("Service Company") have also joined in this application, to the extent necessary, to obtain authority to carry out the transactions proposed to be consummated by them.

All interested persons are referred to said application, which is on file in the office of this Commission, for a statement of the transactions therein proposed, which may be described as follows:

The following table shows the relationship of Railways to its subsidiaries:

Common stock owned by immediate parent	
Name of company	(percent)
The United Light & Railways Co.	
Iowa-Illinois Gas & Electric Co.	100
Mason City & Clear Lake Railroad Co.	100
United Light & Railways Service Co.	100
Continental Gas & Electric Corp.	99.86
Kansas City Power & Light Co.	100
Iowa Power & Light Co.	100
St. Joseph Light & Power Co.	100
Eastern Kansas Utilities, Inc.	100
Hume-Sinclair Coal Mining Co.	26.22

The outstanding securities of Continental consist of 633,122 shares of common stock (including 30 shares reserved

for conversion of outstanding scrip) and a 2½% bank loan outstanding as of February 28, 1949, in the principal amount of \$7,444,700, which matures at the rate of \$750,000 semi-annually. As indicated above, 0.14% of the common stock of Continental, amounting to 915 shares, is owned by persons other than Railways and is held by approximately 35 stockholders.

By order entered December 30, 1947 the Commission approved a plan filed by Railways and its subsidiary company, American Light & Traction Company ("American Light"), pursuant to section 11 (e) of the act generally providing, in so far as Railways is concerned, for the divestment of its interest in American Light and that company's subsidiaries and for the redemption by Railways of its outstanding prior preferred stock. Giving effect to that plan, which has been substantially consummated, the outstanding securities of Railways will consist of 3,173,338 shares of common stock and a bank loan in the principal amount of \$19,500,000 payable August 1, 1950, and renewable, at the option of Railways, with Commission approval, for two additional periods of one year each.

Reclassifications, exchanges and issuances and sales of common stocks by subsidiaries. In order to facilitate the distribution of the portfolio securities contemplated by the plan it is proposed to reclassify the common stock of Iowa Power, St. Joseph, Iowa-Illinois and Kansas City into a larger number of shares. It is also proposed to change such shares of these companies, except the no par value shares of Kansas City, from shares having a par value to shares of no par value and to increase the number of authorized shares of common stock of those companies and of Kansas City. It is stated that no changes will be made in the amount of capital recorded in the capital stock accounts of the respective companies as a result of the proposed reclassification of common stock.

In order to strengthen the capital structures of the operating companies and assist them in meeting their construction requirements, it is proposed that, prior to the liquidation of Railways, additional investments will be made by the holding companies in the common stock of those subsidiaries. An application is presently pending before the Commission with respect to the issue and sale by St. Joseph of 105,213 shares of new common stock without par value to Continental for \$2,000,000 in cash. It is also proposed that Iowa Power shall issue 300,000 additional shares of new common stock without par value to Railways or Continental for \$3,000,000 in cash. If this issuance of common stock precedes the distribution by Continental to Railways of its holdings of Iowa Power common stock, it is provided that the additional shares shall be issued to Continental and that Railways shall contribute to the paid-in surplus of Continental sufficient funds to enable Continental to make this investment. It is also proposed that Iowa Power shall issue 58,499 additional shares of new common stock without par value as a stock dividend, capitalizing \$584,990 of earned surplus.

With respect to Kansas City the plan provides that Railways, subsequent to the acquisition of Continental's net assets, shall invest \$5,000,000 in the common stock of Kansas City in consideration for which Kansas City will issue to Railways the number of shares of its common stock required to bring the total number of such shares outstanding to 1,906,748 shares. The plan also provides that Iowa-Illinois shall issue to Railways 221,003 shares of new common

stock without par value by capitalizing \$356,584.20 of paid-in surplus and \$1,853,445.80 of earned surplus, a total of \$2,210,030.

After giving effect to the proposed reclassifications, exchanges, and the issuances and sales of common stocks by subsidiaries, as outlined above, and after distributions to minority stockholders of Continental, the authorized and outstanding shares of common stock of such companies would be as follows:

	Shares authorized	Shares outstanding	To be distributed to—	
			Railways	Minority interest of Continental
Kansas City.....	3,000,000	1,906,748	1,904,003	2,745
Iowa Power.....	2,500,000	1,588,499	1,586,669	1,830
St. Joseph.....	600,000	317,792	317,334.5	457.5
Iowa-Illinois.....	2,750,000	1,904,003	1,904,003	-----

The plan also provides that after its approval by the Commission the transactions involving changes in the capitalization of the operating companies described above, including the proposed issuance and sale of additional common stock and the capitalization of surplus, may be consummated without further order of the Commission, or all or any of such transactions may be consummated prior to the date the Commission enters an order approving the plan if such transactions are approved separately by the Commission.

The plan also provides that the Certificates of Incorporation of Kansas City, St. Joseph, Iowa Power and Iowa-Illinois will be amended to include provisions requiring that the entire consideration hereafter received upon the issuance of common stock without par value shall be credited to capital and that such provisions may not be eliminated or amended without the vote or consent of the holders of two-thirds of the outstanding common stocks of such companies. It is proposed also to amend the Certificates of Incorporation of these companies to provide for preemptive rights for common stockholders in connection with the issuance of additional shares of common stock for cash except when such shares are sold for cash through a public offering with or without the use of underwriters.

Liquidation of Continental. The subject plan provides that Continental will be liquidated prior to Railways and that such liquidation will be effectuated through the distribution by Continental of its assets to its minority stockholders and to Railways and that Railways will assume Continental's bank loan indebtedness and all of its other debts and liabilities. It is proposed, subject to obtaining the requisite approval of the Commission, that Continental shall sell or otherwise dispose of its investment in Hume-Sinclair Coal Mining Company ("Hume-Sinclair") and shall sell Eastern Kansas to non-affiliated interests or that Eastern Kansas shall be merged into or consolidated with Kansas City or Kansas City shall in some other manner acquire a portion or all of the property and assets of Eastern Kansas. Continental will distribute to its minority com-

mon stockholders three shares of common stock of Kansas City, two shares of common stock of Iowa Power and one-half share of common stock of St. Joseph for each share of common stock of Continental held by such stockholders. Scrip certificates will be distributed to stockholders of Continental in lieu of fractional shares of common stock of St. Joseph.

It is also proposed that all or part of the assets received by Railways from Continental may be pledged as collateral security for the unpaid balance of Continental's bank loan.

The plan further provides that as soon as practicable after the Commission has entered an order approving the plan, the Board of Directors shall take such steps as may be necessary or advisable to effect the dissolution of Continental under the laws of the State of Delaware.

Distributions of subsidiaries' common stocks to Railways' stockholders. The plan contemplates that the common stock of St. Joseph to be acquired by Railways in the liquidation of Continental shall be distributed to the common stockholders of Railways in October 1949 on the basis of one share of St. Joseph's common stock for each ten shares of Railways' common stock. It is also proposed that Railways will distribute to its stockholders the common stock of Iowa Power on the basis of one share of Iowa Power common stock for each two shares of Railways and that Railways will distribute the common stock of Iowa-Illinois on the basis of three shares of the common stock of Iowa-Illinois for each five shares of the common stock of Railways. The plan also proposes that during the first three months of 1950, and in any event prior to the distribution of the common stocks of Iowa Power and Iowa-Illinois, Railways shall offer its common stockholders the right to purchase all of Railways' holdings of the common stock of Kansas City at such price as may be fixed by Railways' Board of Directors, on the basis of three shares of Kansas City common stock for each five shares of Railways' common stock. It is stated that the terms and conditions of such offering shall be submitted to the Commission for its subsequent approval and that such terms shall include appropriate provi-

sions to protect the interests of stockholders of Railways who fail to exercise such rights. The net proceeds realized by Railways from the sale of Kansas City will be applied to pay the balance of the Continental bank loan, assumed by Railways, and the remaining net proceeds shall be applied to the payment of other indebtedness of Railways.

Under the plan it is provided that the distribution of Iowa-Illinois shall be deferred until Railways shall have paid in full all of its bank and other indebtedness and shall have accumulated funds which, in the opinion of its Board of Directors, are sufficient to pay all known and contingent liabilities and expenses of Railways, Continental and Service Company. It is also provided that the distribution of Iowa Power may be combined with the distribution of Iowa-Illinois. It is further provided that in case any excess cash shall have been accumulated, a cash payment may also be included in this distribution, or such excess cash may be contributed as paid-in surplus to Iowa-Illinois upon the assumption by that company of the liabilities of Railways, Continental and Service Company, provided the amount of such liabilities shall not exceed the amount of cash so contributed, without the approval of the Commission.

The application states that it is presently believed that the final distribution can be made by June 1950. Except to the extent that the final distribution may include cash, the future payment of cash dividends on the common stock of Railways is not contemplated.

With respect to the distributions of St. Joseph, Iowa Power, and Iowa-Illinois to be made by Railways, it is proposed that scrip certificates shall be issued in lieu of fractional shares of such stocks. The scrip certificates shall be non-interest-bearing, non-dividend-bearing, and non-voting, and will be issued in bearer form. Such scrip, when combined to aggregate one or more shares, may be surrendered to the issuing company, or such agent as it may designate, in exchange for the number of full shares of common stock represented by the scrip so surrendered. The plan provides that all such scrip certificates shall be surrendered on or before December 31, 1955, and that all scrip certificates outstanding after such date shall be void for all purposes and the holders thereof shall be entitled to no rights whatsoever with respect thereto.

Miscellaneous provisions relating to Railways and Continental. The final distribution to be made by Railways and the distribution by Continental to its minority stockholders shall be made by a depository to be designated and will be made upon surrender for cancellation of the certificates representing the shares of common stock of Continental and Railways. The stock transfer books of Continental and Railways will be permanently closed at the close of business on the day preceding the date fixed as the respective distribution dates, and from and after such dates the common stock of Continental and Railways shall cease to be transferable on the books of the respective companies and the holders of such stock will have only the rights

specifically set forth in this plan and all other rights of such stockholders shall cease and become void. Within ten days after making the deposit with the depositary, a notice shall be mailed by Continental and Railways to their stockholders, notifying them of the distributions to which they are entitled. The right of stockholders to receive common stock and scrip will expire on a date to be fixed by Continental and Railways with the approval of the Commission, and as soon as practicable after that date the depositary shall sell, at public or private sale, all the unexchanged common stock and scrip and the net proceeds of such sale shall be paid proportionately to the record holders of Continental's and Railways' remaining outstanding common stock. All dividends paid on the shares of stock held by the depositary shall be paid to the depositary and held by it for distribution to the persons entitled to receive the shares upon which dividends were paid, except that any dividends received by the depositary upon shares thereafter surrendered by the depositary for scrip certificates of St. Joseph shall be repaid to St. Joseph and shall not be distributed to the holders of scrip certificates issued by St. Joseph or to stockholders entitled to receive such scrip certificates. With respect to the distributions to be made by Railways, the plan provides that so long as the depositary holds 10% or more of the outstanding shares of common stock of Iowa-Illinois the shares so held by the depositary may be voted by Railways or in such manner as the Board of Directors of Railways shall determine, but when the depositary holds less than 10% of the outstanding shares of such common stock, the shares held by the depositary may be voted by the depositary or in such manner as it may determine. This provision is made applicable to shares of Iowa Power held by the depositary for distribution, if the distribution of Iowa Power is combined with the distribution of Iowa-Illinois.

The plan also provides for the liquidation of Service Company. The application indicates that Service Company has no tangible property other than office furniture, fixtures, and working capital. The plan proposes that, after paying or providing for the payment of all liabilities or expenses, the remaining assets of Service Company shall be distributed to Railways. In order to facilitate this liquidation, it is contemplated that Railways may assume any or all liabilities and expenses of Service Company.

The plan also provides that as soon as possible after the Commission has entered an order approving the plan, the Board of Directors of Railways shall call a special meeting of its stockholders to vote upon the question of whether Continental and Railways shall be liquidated and dissolved in accordance with the plan. The effective date of the plan shall be the date upon which it is approved by the requisite holders of two-thirds of the outstanding shares of common stock.

The Commission being required by the provisions of section 11 (e) of the act, before approving any plan submitted, to

find, after notice and opportunity for hearing, that the plan, as submitted or as modified, is necessary to effectuate the provisions of section 11 of the act, and is fair and equitable to the persons affected thereby; and it appearing appropriate that notice of the filing of the plan be given and a hearing held with respect thereto, and that said plan shall not become effective except pursuant to further order of the Commission:

It is ordered, That a hearing under the applicable provisions of the act and the rules and regulations thereunder be held at 10:00 a. m., e. d. s. t., on August 2, 1949, in the offices of the Securities and Exchange Commission, 425 Second Street NW., Washington 25, D. C., in such room as may be designated on that day by the hearing room clerk in Room 101; and that any person desiring to be heard in connection with this proceeding or proposing to intervene or otherwise participate therein, shall file with the Secretary of the Commission on or before July 29, 1949, his request and application therefor as provided in Rule XVII of the rules of practice of the Commission. In the event that amendments to the plan are filed during the course of the proceedings, no notice of such amendments will be given unless specifically ordered by the Commission. Any person desiring to receive further notice of the filing of any additional plans or amendments should file an appearance in these proceedings or otherwise specifically request such notice.

It is further ordered, That William W. Swift, or any other officer or officers of the Commission designated by it for that purpose, shall preside at such hearing and such officer or officers so designated is hereby authorized to exercise all powers granted to the Commission under section 18 (c) of the act and to a hearing officer under the Commission's rules of practice.

The Division of Public Utilities of the Commission having advised the Commission that it has made a preliminary examination of the application and that upon the basis thereof, and without prejudice to the subsequent specification of additional matters and questions upon further examination, the following matters and questions are presented for consideration:

1. Whether the plan as submitted, or as hereafter may be amended, is necessary or appropriate to effectuate the provisions of section 11 (e) of the act and is fair and equitable to the persons affected thereby, and whether the transactions proposed pursuant to the plan otherwise comply with the applicable provisions of the act and the rules and regulations promulgated thereunder.

2. Whether the plan conforms to the applicable provisions of the act in that the consummation thereof requires the approval of the holders of two-thirds of the outstanding shares of the common stock of Railways.

3. Whether the charters and the by-laws of the companies to be distributed contain adequate provisions for the protection of investors, and, if not, what amendments should be required with respect thereto.

4. Whether the fees, expenses, or other remuneration which may be claimed in connection with the plan and the transactions incident thereto are for necessary services and are reasonable in amount.

5. Whether the accounting treatment to be accorded the proposed transactions conforms to sound accounting principles.

6. Whether, and to what extent, the proposed plan should be amended or modified or terms and conditions imposed to insure adequate protection of the public interest and the interest of investors or consumers and to prevent circumvention of the act and rules promulgated thereunder.

It is further ordered, That at said hearing particular attention be directed to the foregoing matters and issues.

It is further ordered, That the Secretary of the Commission shall serve notice of the aforesaid hearing by mailing copies of this notice and order by registered mail to applicants, Illinois Commerce Commission, Public Service Commission of Missouri, Corporation Commission of Kansas, the Executive Council of Iowa and the Federal Power Commission, and that notice to all other persons shall be given by publication of this notice and order in the FEDERAL REGISTER and that a general release of this Commission with respect to this notice and order be distributed to the press and mailed to the mailing list for releases issued under the Public Utility Holding Company Act of 1935.

It is further ordered, That Railways shall give further notice of this hearing to its common stockholders of record and Continental shall give further notice of this hearing to the holders of its outstanding minority common stock of record by mailing each of said persons at his last known address a copy of this notice and order for hearing at least fifteen days prior to the date of said hearing.

By the Commission.

OSCAR LEISTNER

In re: Trust u/w of Oscar Leistner, deceased. File No. D-28-2052-G-1.

Under the authority of the Trading With the Enemy Act, as amended, Executive Order 9193, as amended, and Executive Order 9788, and pursuant to law, after investigation, it is hereby found:

1. That Freida Leistner Rudolph, Kathe Rudolph Mueller, Dora Leistner, Kurt Riedel, and Elsa Riedel Jokisch, whose last known address is Germany,

are residents of Germany and nationals of a designated enemy country (Germany);

2. That the domiciliary personal representatives, heirs, next of kin, legatees and distributees, names unknown, of Gustav Leistner, deceased, and the domiciliary personal representatives, heirs, next of kin, legatees and distributees, names unknown, of Anna Leistner Riedel, deceased, who there is reasonable cause to believe are residents of Germany, are nationals of a designated enemy country (Germany);

3. That all right, title, interest and claim of any kind or character whatsoever of the persons identified in subparagraphs 1 and 2 hereof, and each of them, in and to the trust created under the Will of Oscar Leistner, deceased, is property payable or deliverable to, or claimed by, the aforesaid nationals of a designated enemy country (Germany);

4. That such property is in the process of administration by the Continental Illinois National Bank and Trust Company of Chicago, as Trustee, acting under the judicial supervision of the Probate Court, in and for the County of Cook, State of Illinois;

and it is hereby determined:

5. That to the extent that the persons identified in subparagraphs 1 and 2 hereof are not within a designated enemy country, the national interest of the United States requires that such persons be treated as nationals of a designated enemy country (Germany).

All determinations and all action required by law, including appropriate consultation and certification, having been made and taken, and, it being deemed necessary in the national interest,

There is hereby vested in the Attorney General of the United States the property described above, to be held, used, administered, liquidated, sold or otherwise dealt with in the interest of and for the benefit of the United States.

The terms "national" and "designated enemy country" as used herein shall have the meanings prescribed in section 10 of Executive Order 9193, as amended.

Executed at Washington, D. C., on June 14, 1949.

For the Attorney General.

[Vesting Order 12578, Amdt.]

HARALD NEHLSSEN

In re: Stock, scrip certificate, bonds, currency and coin owned by and debts owing to Harald Nehlsen. F-28-1352-D-6/16.

Vesting Order 12578, dated December 20, 1948, is hereby amended to read as follows:

Under the authority of the Trading With the Enemy Act, as amended, Executive Order 9193, as amended, and Executive Order 9788, and pursuant to law, after investigation, it is hereby found:

1. That Harald Nehlsen, whose last known address is Germany, is a resident of Germany and a national of a designated enemy country (Germany);

2. That the property described as follows:

a. Those certain shares of stock described in Exhibit A, attached hereto and by reference made a part hereof, registered in the name of Harald Nehlsen and presently in the custody of Helene Engelke, Bogota, New Jersey, together with all declared and unpaid dividends thereon,

b. One hundred (100) shares of no par value common capital stock of National

Distillers Products Corporation, 120 Broadway, New York, New York, a corporation organized under the laws of the State of Virginia, evidenced by certificate number TC160876, registered in the name of Harald Nehlsen and presently in the custody of Bankers Trust Company, 16 Wall Street, New York, New York, as transfer agent of the aforesaid National Distillers Products Corporation, together with all declared and unpaid dividends thereon,

c. Thirty-three and one-half (33½) shares of no par value (new) common capital stock of Standard Brands Incorporated, 595 Madison Avenue, New York, New York, a corporation organized under the laws of the State of Delaware, evidenced by certificates numbered C 418690 for one hundred (100) shares and CO 480099 for thirty-four (34) shares of old no par value common capital stock of said corporation, registered in the name of Harald Nehlsen and presently in the custody of Helene Engelke, Bogota, New Jersey, together with all declared and unpaid dividends thereon and any and all rights of exchange thereof for a certificate or certificates of said no par value (new) common capital stock of the aforesaid Standard Brands Incorporated,

d. One (1) voting trust certificate, registered in the name of Ferdinand Nehlsen and bearing number 443499, for three (3) shares of no par value common capital stock of The Pennroad Corporation, Wilmington, Delaware, a corporation organized under the laws of the State of Delaware, said voting trust certificate being presently in the custody of Helene Engelke, Bogota, New Jersey, together with any and all rights thereunder and thereto,

e. Five (5) shares of \$50 par value capital stock of The Pennsylvania Railroad Company, Broad Street Station Building, 1617 Pennsylvania Blvd., Philadelphia, Pennsylvania, a corporation organized under the laws of the State of Pennsylvania, evidenced by certificate number P 707313 for one (1) share and certificates numbered A 916606 and A 931621 for two (2) shares each, registered in the name of Ferdinand Nehlsen and presently in the custody of Helene Engelke, Bogota, New Jersey, together with all declared and unpaid dividends thereon,

f. One (1) scrip certificate, bearing number W 2664, for one hundred fifty two-hundredths (150/200) share of California Packing Corporation, 101 California Street, San Francisco, California, a corporation organized under the laws of the State of New York, presently in the custody of Helene Engelke, Bogota, New Jersey, together with any and all rights thereunder and thereto,

g. Three (3) Rhine Ruhr Water Service Union 6% bearer bonds, due January 1, 1953, of \$1,000 face value each, bearing the numbers M4329, M4330 and M4880, presently in the custody of Helene Engelke, Bogota, New Jersey, together with any and all rights thereunder and thereto,

h. United States currency and coin in the aggregate amount of \$828.97, presently in the custody of Helene Engelke, Bogota, New Jersey,

i. Those certain debts or other obligations of the corporations whose names and addresses are listed in Exhibit B, attached hereto and by reference made a part hereof, evidenced by those certain dividend checks, issued by or on behalf of said corporations, payable to Harald Nehlsen which are more particularly described in Exhibit B and are presently in the custody of Helene Engelke, Bogota, New Jersey, together with any and all accruals to the aforesaid debts or other obligations and any and all rights to demand, enforce and collect the same and together with all rights in, to and under, including particularly but not limited to, the rights to possession and presentation for collection and payment of the aforesaid dividend checks, and

j. That certain debt or other obligations of The Pennsylvania Railroad Corporation, Broad Street Station Building, 1617 Pennsylvania Blvd., Philadelphia, Pennsylvania, evidenced by dividend check number 134981, dated June 30,

1941, payable to Ferdinand Nehlsen, issued by said Corporation in the amount of \$5.00 and presently in the custody of Helene Engelke, Bogota, New Jersey, together with any and all accruals to the aforesaid debt or other obligation and any and all rights to demand, enforce and collect the same and together with all rights in, to and under, including particularly but not limited to, the rights to possession and presentation for collection and payment of the aforesaid dividend check,

is property within the United States owned or controlled by, payable or deliverable to, held on behalf of or on account of, or owing to, or which is evidence of ownership or control by Harald Nehlsen, the aforesaid national of a designated enemy country (Germany);

and it is hereby determined:

3. That to the extent that the person named in subparagraph 1 hereof is not within a designated enemy country, the national interest of the United States

requires that such person be treated as a national of a designated enemy country (Germany).

All determinations and all action required by law, including appropriate consultation and certification, having been made and taken, and, it being deemed necessary in the national interest,

There is hereby vested in the Attorney General of the United States the property described above, to be held, used, administered, liquidated, sold or otherwise dealt with in the interest of and for the benefit of the United States.

The terms "national" and "designated enemy country" as used herein shall have the meanings prescribed in section 10 of Executive Order 9193, as amended.

Executed at Washington, D. C., on July 6, 1949.

For the Attorney General.

KAETHE DEMANKOWSKI AND ALMA SCHLESSINGER

In re: Rights of Kaethe Demankowski and Alma Schlessinger under insurance contract. File No. D-28-12408-H-1.

Under the authority of the Trading With the Enemy Act, as amended, Executive Order 9193, as amended, and Executive Order 9788, and pursuant to law, after investigation, it is hereby found:

1. That Kaethe Demankowski and Alma Schlessinger, whose last known address is Germany, are residents of Germany and nationals of a designated enemy country (Germany);

2. That the net proceeds due or to become due under a contract of insur-

ance evidenced by policy No. 993-012, issued by The Maccabees Insurance Company, Detroit, Michigan, to Fred W. Meyer, together with the right to demand, receive and collect said net proceeds,

is property within the United States owned or controlled by, payable or deliverable to, held on behalf of, or on account of, or owing to, or which is evidence of ownership or control by, Kaethe Demankowski and Alma Schlessinger, the aforesaid nationals of a designated enemy country (Germany);

and it is hereby determined:

3. That to the extent that the persons named in subparagraph 1 hereof are not within a designated enemy country, the

national interest of the United States requires that such persons be treated as nationals of a designated enemy country (Germany).

All determinations and all action required by law, including appropriate consultation and certification, having been made and taken, and, it being deemed necessary in the national interest,

There is hereby vested in the Attorney General of the United States the property described above, to be held, used, administered, liquidated, sold or otherwise dealt with in the interest of and for the benefit of the United States.

The terms "national" and "designated enemy country" as used herein shall have the meanings prescribed in section 10 of Executive Order 9193, as amended.

Executed at Washington, D. C., on July 6, 1949.

SHIZUO IWAI

In re: rights of Shizuo Iwai under insurance contract. File No. F-39-4441-H-1.

Under the authority of the Trading With the Enemy Act, as amended, Executive Order 9193, as amended, and Executive Order 9788, and pursuant to law, after investigation, it is hereby found:

1. That Shizuo Iwai, whose last known address is Japan, is a resident of Japan and a national of a designated enemy country (Japan);

2. That the net proceeds due or to become due under a contract of insurance evidenced by policy No. 8,850,432, issued by the New York Life Insurance Company, New York, New York, to Shizuo Iwai, together with the right to demand, receive and collect said net proceeds, is property within the United States owned or controlled by, payable or deliverable to, held on behalf of or on account of, or owing to, or which is evidence of ownership or control by, the aforesaid national of a designated enemy country (Japan);

and it is hereby determined:

3. That to the extent that the person named in subparagraph 1 hereof is not within a designated enemy country, the national interest of the United States requires that such person be treated as a national of a designated enemy country (Japan).

All determinations and all action required by law, including appropriate consultation and certification, having been made and taken, and, it being deemed necessary in the national interest,

There is hereby vested in the Attorney General of the United States the property described above, to be held, used, administered, liquidated, sold or otherwise dealt with in the interest of and for the benefit of the United States.

The terms "national" and "designated enemy country" as used herein shall have the meanings prescribed in section 10 of Executive Order 9193, as amended.

Executed at Washington, D. C., on July 6, 1949.

For the Attorney General.

[SEAL] DAVID L. BAZELON,
Assistant Attorney General,
Director, Office of Alien Property.

[Vesting Order 13489]

KEISEI AND HUMIKO KURODA

In re: Rights of Keisei Kuroda and Humiko Kuroda under insurance contract. File No. D-39-19230-H-1.

Under the authority of the Trading With the Enemy Act, as amended, Executive Order 9193, as amended, and Executive Order 9788, and pursuant to law, after investigation, it is hereby found:

1. That Keisei Kuroda and Humiko Kuroda, whose last known address is Japan, are residents of Japan and nationals of a designated enemy country (Japan);

2. That the net proceeds due or to become due under a contract of insurance evidenced by policy No. 740,013, issued by The Manufacturers Life Insurance Company, Toronto, Canada, to Keisei Kuroda, together with the right to demand, receive and collect said net proceeds (including without limitation the right to proceed for collection against branch offices and legal reserves maintained in the United States),

is property within the United States owned or controlled by, payable or de-

liverable to, held on behalf of or on account of, or owing to, or which is evidence of ownership or control by, Keisei Kuroda or Humiko Kuroda, the aforesaid nationals of a designated enemy country (Japan);

and it is hereby determined:

3. That to the extent that the persons named in subparagraph 1 hereof are not within a designated enemy country, the national interest of the United States requires that such persons be treated as nationals of a designated enemy country (Japan).

All determinations and all action required by law, including appropriate consultation and certification, having been made and taken, and, it being deemed necessary in the national interest,

There is hereby vested in the Attorney General of the United States the property described above, to be held, used, administered, liquidated, sold or otherwise dealt with in the interest of and for the benefit of the United States.

The terms "national" and "designated enemy country" as used herein shall have the meanings prescribed in section 10 of Executive Order 9193, as amended.

Executed at Washington, D. C., on July 6, 1949.

For the Attorney General.

MARTIN BRINKMAN A. G.

In re: Bank account owned by and debt owing to Martin Brinkman, A. G., also known as Martin Brinkmann Kommandit - Gesellschaft. F-28-9382-C-2, F-28-9382-E-1.

Under the authority of the Trading With the Enemy Act, as amended, Executive Order 9193, as amended, and Executive Order 9788, and pursuant to law, after investigation, it is hereby found:

1. That Martin Brinkman, A. G., also known as Martin Brinkmann Kommandit-Gesellschaft, the last known address of which is Hauptverwaltung Berlin W15, Germany, is a corporation, partnership, association or other business organization, organized under the laws of Germany, and which has or, since the effective date of Executive Order 8389, as amended, has had its principal place of business in Germany, and is a national of a designated enemy country (Germany);

2. That the property described as follows:

a. That certain debt or other obligation of New York Trust Company, 100 Broadway, New York, New York, arising out of a checking account, entitled Edward J. O'Brien & Co., blocked Alien Property Custodian account, maintained at the aforesaid bank, and any and all rights to demand, enforce and collect the same, and

b. That certain debt or other obligation owing to Martin Brinkman, A. G., also known as Martin Brinkmann Kommandit-Gesellschaft, by L. B. Jenkins Tobacco Co., Inc., P. O. Box 1775, Richmond 14, Virginia, in the amount of \$30,000.00, as of June 7, 1949, together with any and all accruals thereto, and any and all rights to demand, enforce and collect the same,

is property within the United States owned or controlled by, payable or deliverable to, held on behalf of or on account of, or owing to, or which is evidence of ownership or control by Martin Brinkman, A. G., also known as Martin Brinkmann Kommandit-Gesellschaft, the aforesaid national of a designated enemy country (Germany);

and it is hereby determined:

3. That to the extent that the person named in subparagraph 1 hereof is not within a designated enemy country, the

national interest of the United States requires that such person be treated as a national of a designated enemy country (Germany).

All determinations and all action required by law, including appropriate consultation and certification, having been made and taken, and, it being deemed necessary in the national interest,

There is hereby vested in the Attorney General of the United States the property described above, to be held, used, administered, liquidated, sold or otherwise dealt with in the interest of and for the benefit of the United States.

The terms "national" and "designated enemy country" as used herein shall have the meanings prescribed in section 10 of Executive Order 9193, as amended.

Executed at Washington, D. C., on July 6, 1949.

WENZEL MENDEL

In re: Stock and bank account owned by Wenzel Mendl. F-28-19314-A-1, D-1, E-1.

Under the authority of the Trading With the Enemy Act, as amended, Executive Order 9193, as amended, and Executive Order 9788, and pursuant to law, after investigation, it is hereby found:

1. That Wenzel Mendl, whose last known address is 12 Universitätsplatz (17a) Heidelberg, Germany, is a resident of Germany and a national of a designated enemy country (Germany);

2. That the property described as follows:

a. That certain debt or other obligation owing to Wenzel Mendl, by South Side National Bank, 3606 Gravois Avenue, St. Louis 16, Missouri, arising out of a savings account, account number 982, entitled Wenzel Mendl, maintained at the aforesaid bank, and any and all rights to demand, enforce and collect the same, and

b. Seventy (70) shares of \$20.00 par value common capital stock of South Side National Bank, 3606 Gravois Avenue, St. Louis 16, Missouri, evidenced by a certificate numbered 1180, registered in the name of Wenzel Mendl, and presently in the custody of Henry Heimbacher, 721 Pestalozzi Street, St. Louis 18, Missouri, together with all declared and unpaid dividends thereon, and any and all dividend checks,

is property within the United States owned or controlled by, payable or deliverable to, held on behalf of or on account of, or owing to, or which is evidence of ownership or control by, the aforesaid national of a designated enemy country (Germany);

and it is hereby determined:

3. That to the extent that the person named in subparagraph 1 hereof is not within a designated enemy country, the national interest of the United States requires that such person be treated as a national of a designated enemy country (Germany).

All determinations and all action required by law, including appropriate consultation and certification, having been made and taken, and, it being deemed necessary in the national interest,

There is hereby vested in the Attorney General of the United States the property described above, to be held, used, administered, liquidated, sold or otherwise dealt with in the interest of and for the benefit of the United States.

The terms "national" and "designated enemy country" as used herein shall have the meanings prescribed in section 10 of Executive Order 9193, as amended.

Executed at Washington, D. C., on July 6, 1949.

For the Attorney General.

[SEAL] DAVID L. BAZELON,
Assistant Attorney General,

[Vesting Order 13526]

MATAICHI OTA

In re: Stock owned by Mataichi Ota, also known as Otto Mataichi. F-39-4228-D-1.

Under the authority of the Trading With the Enemy Act, as amended, Executive Order 9193, as amended, and Executive Order 9788, and pursuant to law, after investigation, it is hereby found:

1. That Mataichi Ota, also known as Otto Mataichi, whose last known address is Tomiyoshi, Oaza, Mayakami-mura, Mitsu-gun, Okayama-ken, Japan, is a resident of Japan and a national of a designated enemy country (Japan);

2. That the property described as follows: Three and three-fourths (3¾) shares of \$100 par value common capital stock of Capitol Securities Corporation, a corporation organized under the laws of the State of Idaho, evidenced by certificate numbered 387, registered in the name of Otto Mataichi, together with all declared and unpaid dividends thereon,

is property within the United States owned or controlled by, payable or deliverable to, held on behalf of or on account of, or owing to, or which is evidence of ownership or control by, the aforesaid national of a designated enemy country (Japan);

and it is hereby determined:

3. That to the extent that the person named in subparagraph 1 hereof is not within a designated enemy country, the national interest of the United States requires that such person be treated as a national of a designated enemy country (Japan).

All determinations and all action required by law, including appropriate consultation and certification, having been made and taken, and, it being deemed necessary in the national interest,

There is hereby vested in the Attorney General of the United States the property described above, to be held, used, administered, liquidated, sold or otherwise dealt with in the interest of and for the benefit of the United States.

The terms "national" and "designated enemy country" as used herein shall have

No. 136—8

the meanings prescribed in section 10 of Executive Order 9193, as amended.

Executed at Washington, D. C., on July 6, 1949.

For the Attorney General.

[SEAL] DAVID L. BAZELON,
Assistant Attorney General,
Director, Office of Alien Property.

[Vesting Order 13530]

CHARLOTTE STECK

In re: Debts owing to Charlotte Steck. F-28-14228.

Under the authority of the Trading With the Enemy Act, as amended, Executive Order 9193, as amended, and Executive Order 9788, and pursuant to law, after investigation, it is hereby found:

1. That Charlotte Steck, whose last known address is Amt. Buhl, Baden, Germany, is a resident of Germany and a national of a designated enemy country (Germany);

2. That the property described as follows: Those certain debts or other obligations evidenced by four (4) checks, each in the amount of \$40.00, numbered 51709, 79992, 84177, 90515, dated November 1, 1939, January 2, 1940, February 1, 1940 and March 1, 1940, respectively; said checks issued by the First National Bank of Chicago, Chicago, Illinois, payable to Charlotte Steck, and presently in the custody of the Attorney General of the United States, and any and all rights to demand, enforce and collect the aforesaid debts or other obligations, and any and all accruals thereto, together with any and all rights in and under, including particularly the right to presentation for payment of the aforesaid checks,

is property within the United States owned or controlled by, payable or deliverable to, held on behalf of or on account of, or owing to, or which is evidence of ownership or control by, the aforesaid national of a designated enemy country (Germany);

and it is hereby determined:

3. That to the extent that the person named in subparagraph 1 hereof is not within a designated enemy country, the national interest of the United States requires that such person be treated as a national of a designated enemy country (Germany).

All determinations and all action required by law, including appropriate consultation and certification, having been made and taken, and, it being deemed necessary in the national interest,

There is hereby vested in the Attorney General of the United States the property described above, to be held, used, administered, liquidated, sold or otherwise dealt with in the interest of and for the benefit of the United States.

The terms "national" and "designated enemy country" as used herein shall have the meanings prescribed in section 10 of Executive Order 9193, as amended.

Executed at Washington, D. C., on July 6, 1949.

For the Attorney General.

[SEAL] DAVID L. BAZELON,
Assistant Attorney General,
Director, Office of Alien Property.

[Vesting Order 13532]

JOHANNES THEDENS

In re: Claim owned by Johannes Thedens also known as Johannes Thedeus. F-28-28256-C-2.

Under the authority of the Trading With the Enemy Act, as amended, Executive Order 9193, as amended, and Executive Order 9788, and pursuant to law, after investigation, it is hereby found:

1. That Johannes Thedens also known as Johannes Thedeus, whose last known address is Hochallee 25, Hamburg 13, Germany, is a resident of Germany and a national of a designated enemy country (Germany);

2. That the property described as follows: That certain claim against the State of New York and the Comptroller of the State of New York, arising by reason of the collection or receipt by said Comptroller of the State of New York, pursuant to the provisions of Section 303, Article III of the Abandoned Property Law of the State of New York, of the following property: That certain sum representing a savings account, account number 986,144, entitled Johannes Thedens, maintained at the Central Savings Bank, 4th Avenue and 14th Street, New York, New York, which sum was paid or delivered to the Comptroller of the State of New York, said sum being presently in the custody of the State of New York, Albany, New York,

and any and all rights to file with said Comptroller of the State of New York, the aforesaid claim, and to demand, and collect the same,

is property within the United States owned or controlled by, payable or deliverable to, held on behalf of or on account of, or owing to, or which is evidence of ownership or control by, the aforesaid national of a designated enemy country (Germany).

and it is hereby determined:

3. That to the extent that the person named in subparagraph 1 hereof is not within a designated enemy country, the national interest of the United States requires that such person be treated as a national of a designated enemy country (Germany);

All determinations and all action required by law, including appropriate consultation and certification, having been made and taken, and, it being deemed necessary in the national interest,

There is hereby vested in the Attorney General of the United States the property described above, to be held, used, administered, liquidated, sold or otherwise dealt with in the interest of and for the benefit of the United States.

The terms "national" and "designated enemy country" as used herein shall have the meanings prescribed in section 10 of Executive Order 9193, as amended.

Executed at Washington, D. C., on July 6, 1949.

For the Attorney General.

[SEAL] DAVID L. BAZELON,
Assistant Attorney General,
Director, Office of Alien Property.

[Vesting Order 13533]

MITY UYEKI

In re: Bank account owned by Mity Uyeke, also known as Fujinobu Uyeke. F-39-6515-E-1.

Under the authority of the Trading With the Enemy Act, as amended, Executive Order 9193, as amended, and Executive Order 9788, and pursuant to law, after investigation, it is hereby found:

1. That Mity Uyeke, also known as Fujinobu Uyeke, whose last known address is Japan, is a resident of Japan and a national of a designated enemy country (Japan);

2. That the property described as follows: That certain debt or other obligation owing to Mity Uyeke, also known as Fujinobu Uyeke, by the Empire Trust Company, 580 Fifth Avenue, New York 19, New York, arising out of a savings account, account number A978, entitled (Mr.) Mity Uyeke, maintained at the aforesaid bank, and any and all rights to demand, enforce and collect the same,

is property within the United States owned or controlled by, payable or deliverable to, held on behalf of or on account of, or owing to, or which is evidence of ownership or control by, the aforesaid national of a designated enemy country (Japan);

and it is hereby determined:

3. That to the extent that the person named in subparagraph 1 hereof is not within a designated enemy country, the national interest of the United States requires that such person be treated as a national of a designated enemy country (Japan).

All determinations and all action required by law, including appropriate consultation and certification, having been made and taken, and, it being deemed necessary in the national interest,

There is hereby vested in the Attorney General of the United States the property described above, to be held, used, administered, liquidated, sold or otherwise dealt with in the interest of and for the benefit of the United States.

The terms "national" and "designated enemy country" as used herein shall have the meanings prescribed in section 10 of Executive Order 9193, as amended.

Executed at Washington, D. C., on July 6, 1949.

For the Attorney General.

[Return Order 329]

RAOUL HAFNER

Having considered the claim set forth below and having issued a determination allowing the claim which is incorporated by reference herein and filed herewith,

It is ordered, That the claimed property, described below and in the determination, including all royalties accrued thereunder and all damages and profits recoverable for past infringement thereof, be returned after adequate provision for taxes and conservatory expenses:

Claimant, Claim No., Notice of Intention To Return Published, and Property

Raoul Hafner, Somerset, England; Claim No. 3387; April 8, 1949 (14 F. R. 1701); Property described in Vesting Order No. 201 (8 F. R. 625, January 16, 1943) relating to all right, title and interest in and to United States Letters Patent Nos. 2,121,345; 2,131,348; 2,067,633; 2,150,969; 2,265,366; 2,070,657; 2,078,663; 2,067,634; and the undivided one-half part of the whole right, title and interest in and to United States Letters Patent No. 1,909,845.

Property described in Vesting Order No. 2429 (8 F. R. 16536, December 8, 1943) relating to all right, title and interest in and to United States Letters Patent Nos. 2,088,413 and 2,047,776.

Property described in Vesting Order No. 68 (7 F. R. 6181, August 11, 1942) relating to United States Patent Application Serial No. 223,406 (now United States Letters Patent No. 2,338,935).

Property described in Vesting Order No. 2435 (8 F. R. 16327, December 4, 1943) relating to an undivided one-half part of the whole right, title and interest in and to United States Letters Patent No. 1,992,015 and an undivided one-third part of the whole right, title and interest in and to United States Letters Patent No. 2,070,686.

This return shall not be deemed to include the rights of any licensees under the above patents.

Appropriate documents and papers effectuating this order will issue.

Executed at Washington, D. C., on July 11, 1949.

For the Attorney General.

[SEAL] DAVID L. BAZELON,
Assistant Attorney General,
Director, Office of Alien Property.

FEDERAL REGISTER

THE NATIONAL ARCHIVES
LITTERA SCRIPTA MANET
OF THE UNITED STATES
1934

VOLUME 14 NUMBER 136

Washington, Saturday, July 16, 1949

TITLE 14—CIVIL AVIATION

REPRINTING UNDER NEW NUMBERING SYSTEM

Title 14 has been extensively renumbered in the Code of Federal Regulations, 1949 Edition, in order to conform it to the system prescribed by the Regulations of the Administrative Committee of the Federal Register (13 F. R. 5929). Future amendments will be published under the new numbers. The currently effective text of Title 14, therefore, has been renumbered under the new system and reprinted below. All amendments which have been published in the FEDERAL REGISTER through June 30, 1949, and which are still in effect, have been incorporated in this reprint. The numbering of amendments published between June 30, 1949, and the date of this issue is explained in a note following the reprint.

This reprint was prepared by the Division of the Federal Register and individually approved by the Civil Aeronautics Board and the Civil Aeronautics Administration as to the text of their respective materials.

M. C. MULLIGAN,
Secretary,
Civil Aeronautics Board.
D. W. RENTZEL,
Administrator of Civil Aeronautics.

Part

206 Certificates of public convenience and necessity; temporary interruption of service or change of route.

PERMITS TO FOREIGN AIR CARRIERS

211 Applications for permits to foreign air carriers.

TARIFFS OF AIR CARRIERS

- 221 Preparation of tariffs of air carriers.
 222 Filing and posting tariffs of air carriers.
 223 Tariffs of air carriers; free and reduced rate transportation.
 224 Tariffs of air carriers; free and reduced rate transportation; access to aircraft for safety purposes.

TRANSPORTATION OF MAIL

- 231 Transportation of mail; mail schedules.
 232 Transportation of mail; review of orders of Postmaster General.
 233 Transportation of mail; free travel for postal employees.
 234 Petitions for determination of rates for transportation of mail.

ACCOUNTS, RECORDS AND REPORTS

- 241 Filing of reports by certificated air carriers.
 242 Filing of reports by irregular air carriers and noncertificated cargo carriers.
 243 Filing of reports by Alaskan air carriers.
 244 Filing of reports by air freight forwarders.
 245 Reports of ownership of stock and other interests.
 246 Reports of stock ownership of affiliates of air carriers.

- Part
 247 Direct airport-to-airport mileage records.
 248 Submission of audit reports by public accountants.
 249 Preservation of accounts, records and memoranda.

PROHIBITED INTERESTS

- 251 Prohibited interests; interlocking relationships.

POOLING AND OTHER AGREEMENTS

- 261 Filing of agreements.
 262 Agreements between air carriers and foreign countries.

CLASSIFICATION AND EXEMPTION OF CARRIERS

- 290 Application for exemptions of carriers.
 291 Classification and exemption of irregular air carriers.
 292 Classification and exemption of Alaskan air carriers.
 293 Classification and exemption of carriers; omission of stop at route junction points.
 295 Classification and exemption of non-certificated cargo carriers.
 296 Classification and exemption of air freight forwarders.

SUBCHAPTER C—PROCEDURAL REGULATIONS

- 301 Rules of practice in air safety proceedings [note].
 302 Rules of practice in economic proceedings.

Subchapter A—Civil Air Regulations

PART 1—AIRWORTHINESS CERTIFICATES

CROSS REFERENCE: For Aircraft Registration Certificates, see Part 501 of this title.

AIRWORTHINESS CERTIFICATES

- Sec.
 1.1 Application.
 1.2 Requirements for issuance.
 1.3 Transferability.

AIRWORTHINESS CERTIFICATE RULES

- 1.20 Display.
 1.21 Cancellation.
 1.22 Surrender.
 1.23 Inspection.
 1.24 Maintenance of certificated aircraft.

AUTHORITY: §§ 1.1 to 1.24 issued under sec. 205 (a), 52 Stat. 984; 49 U. S. C. 425 (a). Interpret or apply sec. 603, 52 Stat. 1009; 49 U. S. C. 553.

SOURCE: §§ 1.1 to 1.24 contained in Amendment 131, Civil Air Regulations, 6 F. R. 5037, except as noted following sections affected. Redesignated by SR-327, 13 F. R. 5486.

AIRWORTHINESS CERTIFICATES

§ 1.1 *Application.* Application for an airworthiness certificate may be made by the registered owner of any aircraft registered as an aircraft of the United States upon the applicable form prescribed by the Administrator.

[Amdt. 131, 6 F. R. 5037, as amended by Amdt. 01-2, 12 F. R. 949]

§ 1.2 *Requirements for issuance.* Prior to the issuance of an airworthiness certificate, the subject aircraft shall be inspected by a duly authorized representative for the Administrator to determine whether it is in condition for safe operation and complies with the airworthiness requirements specified in this subchapter: *Provided*, That an airworthiness certificate may be issued for an aircraft for which no such certificate has previously been issued and which has been manufactured under type cer-

tificate or under a type and a production certificate if the applicant for such certificate, upon request, presents to a duly authorized representative for the Administrator a Statement of Conformity properly executed by the manufacturer of the aircraft on a form prescribed by the Administrator, and if the aircraft satisfactorily passes an inspection made to determine whether such aircraft is in condition for safe operation: *Provided further*, That an aircraft manufactured under a type certificate only shall undergo, and an aircraft manufactured under a type and a production certificate may be required to undergo, an inspection to determine whether such aircraft conforms to the type certificate under which it is manufactured.

[Amdt. 131, 6 F. R. 5037, as amended by Amdt. 01-2, 12 F. R. 949]

§ 1.3 *Transferability.* An airworthiness certificate and the attached currently effective Aircraft Operation Record, upon transfer of ownership, shall remain with the aircraft for which they were issued.

AIRWORTHINESS CERTIFICATE RULES

§ 1.20 *Display.* An airworthiness certificate shall be carried at all times in the aircraft for which such certificate has been issued, and shall be presented upon the request of any duly authorized representative for the Administrator or Board, or any State or municipal official charged with enforcing local laws or regulations involving Federal compliance.

§ 1.21 *Cancellation.* An airworthiness certificate may be canceled upon the written request of the registered owner of the aircraft.

§ 1.22 *Surrender.* Upon the cancellation, suspension, revocation, or expiration of an aircraft airworthiness certificate the owner of the aircraft shall, upon request, surrender such certificate to any officer or employee of the Administrator.

§ 1.23 *Inspection.* An inspector of the Administrator shall be permitted at any time and place to make such inspections as may be deemed necessary to determine compliance with the requirements of this part.

§ 1.24 *Maintenance of certificated aircraft.* A certificated aircraft shall not be operated unless maintained in condition for safe operation.

PART 2—TYPE AND PRODUCTION CERTIFICATES

GENERAL

- Sec.
 2.1 Definition.

TYPE CERTIFICATES

- 2.10 Application.
 2.11 Requirements for issuance.
 2.12 Duration.
 2.13 Transferability and licensing.

PRODUCTION CERTIFICATES

- 2.20 Application.
 2.21 Requirements for issuance.
 2.22 Production limitation record.
 2.23 Duration.
 2.24 Changes.
 2.25 Transferability.
 2.26 Amendments.

TYPE AND PRODUCTION CERTIFICATE RULES

- Sec.
2.30 Display.
2.31 Cancellation.
2.32 Surrender.
2.33 Inspection.
2.34 Statement of conformity.
2.35 Production reports.
2.36 Identification.

AUTHORITY: §§ 2.1 to 2.36 issued under sec. 205 (a), 52 Stat. 984; 49 U. S. C. 425 (a). Interpret or apply sec. 601, 52 Stat. 1007; 49 U. S. C. 551.

SOURCE: §§ 2.1 to 2.36 contained in Amendment 02-0, Civil Air Regulations, 11 F. R. 7032, except as noted following section affected. Redesignated by SR-327, 13 F. R. 5486.

NOTE: Amendment 02-0, Civil Air Regulations, June 11, 1946, effective July 1, 1946, 11 F. R. 7032, provides as follows:

The Civil Aeronautics Board is authorized under section 609 of the Civil Aeronautics Act of 1938 (sec. 609, 52 Stat. 1011; 49 U. S. C. 559) to suspend or revoke type and production certificates. The Administrator, under the same section of the act, is authorized in cases of emergency to suspend such certificates in whole or in part for a limited period. In so doing he is required to notify immediately the holder and file a complaint with the Board, in which proceeding the holder is entitled to a hearing.

Certificates may be suspended if the interest of the public so requires, or may be revoked for any cause which at the time of revocation would justify the Administrator in refusing to issue to the holder a like certificate. Any deliberate misrepresentation in the application or in the submission of any information accompanying the application, or in any statement or report required of a certificate holder under these regulations, may be grounds for the suspension or revocation of a certificate.

In addition to the above grounds, production certificates may be suspended or revoked for any of the following reasons:

1. Willful violation on the part of the manufacturer of any portion of the Civil Aeronautics Act or any regulation promulgated thereunder relating to the production of articles authorized by the production certificate.
2. Demonstration of incompetency, carelessness or negligence, or the willful use of inferior or improper materials in the manufacture of articles covered by the certificate.
3. Failure of the manufacturer to maintain adequate facilities and personnel to assure the airworthiness and conformity of articles produced.
4. Refusal of the manufacturer to submit to inspection upon proper demand by a representative of the Administrator, or to render any reasonable assistance in connection therewith.

GENERAL

§ 2.1 Definition. The term "product" as used in this part shall mean:

- (a) An aircraft,
- (b) An aircraft engine,
- (c) A propeller, or
- (d) Any appliance specified in the Civil Air Regulations as eligible for a type or production certificate.

TYPE CERTIFICATES

§ 2.10 Application. The application for a type certificate for a specified product shall be made upon a form prescribed and furnished by the Administrator.

§ 2.11 Requirements for issuance. (a) The applicant shall submit with the ap-

plication, or within a reasonable time thereafter, such drawings and other technical data concerning the design, material, specifications, construction, and performance of the product as may be required by the Administrator to show compliance with the pertinent parts of this subchapter.

(b) A product or components thereof shall be subjected to such tests as the Administrator may prescribe, consistent with the pertinent parts of this subchapter.

(c) One article of the product shall be completed prior to the issuance of a type certificate, and shall meet such standards as are required by the pertinent parts of this subchapter.

§ 2.12 Duration. A type certificate shall remain in effect until such time as it is canceled, suspended, revoked, or a termination date is fixed by the Board.

§ 2.13 Transferability and licensing. A type certificate is transferable, and the benefits of such certificate may be extended by licensing arrangements. In the event of any transfer or licensing arrangement the person making the transfer or granting the license shall immediately notify the Administrator in writing. Upon the termination of any licensing arrangement the grantor of the license shall immediately notify the Administrator in writing.

PRODUCTION CERTIFICATES

§ 2.20 Application. (a) The application for a production certificate shall be made upon a form prescribed and furnished by the Administrator and shall specify only a product for which a type certificate has been issued.

(b) The application shall be accompanied by a report which will include at least the following:

- (1) A description of the manufacturing lay-out and production flow,
- (2) A listing and description of any special processes required by the design of the product to be manufactured,
- (3) A description of the established quality control organization, its functions and responsibilities, and
- (4) If the application is for the manufacture of an aircraft, a description of the flight test procedure established by the manufacturer for the testing of production aircraft and a copy of the flight test check list to be used.

§ 2.21 Requirements for issuance. (a) The applicant shall hold a currently effective type certificate for the product to be manufactured, or shall hold a current right to the benefits of such certificate under a licensing arrangement.

(b) Upon receipt of the application with supporting information, and after an inspection of the applicant's organization and production facilities, the Administrator shall issue a production certificate if he finds that the applicant is adequately prepared to manufacture the product and to control its quality to the extent that each article will conform with the design provisions of the pertinent type certificate.

§ 2.22 Production limitation record. The benefits of a production certificate shall be available only with respect to the

type certificate or certificates set forth in the currently effective production limitation record, prescribed and issued by the Administrator, which shall constitute a part of the production certificate.

§ 2.23 Duration. A production certificate shall remain in effect until such time as it is canceled, suspended, or revoked, a termination date is fixed by the Board, or the location of the manufacturing facilities is changed.

§ 2.24 Changes. The holder of a production certificate shall immediately notify the Administrator in writing of changes in the basic organization, methods, procedures, facilities, or location of the facilities which may affect the conformity of quality control of the product manufactured.

§ 2.25 Transferability. A production certificate is not transferable.

§ 2.26 Amendments. (a) The holder of a production certificate desiring the addition of another type certificate to the production certificate shall submit an application on a form provided by the Administrator for that purpose.

(b) The application shall be accompanied by a report describing clearly all additional facilities, methods, or processes required by the particular design of the product to be manufactured under the type certificate to be added.

(c) When, on the basis of the procedure specified in § 2.21, the Administrator finds the facilities, methods, and processes adequate he shall include the additional type certificate in the production limitation record.

TYPE AND PRODUCTION CERTIFICATE RULES

§ 2.30 Display. Type certificates shall be made available for examination by representatives of the Administrator or the Board. Production certificates shall be prominently displayed in the main office of the factory.

§ 2.31 Cancellation. Type and production certificates may be canceled upon the written request of the holder thereof.

§ 2.32 Surrender. Upon the cancellation, suspension, revocation, or termination of a type or production certificate, the holder thereof shall, upon request, surrender such certificate to an authorized representative of the Administrator.

§ 2.33 Inspection. (a) A product manufactured under a type certificate only shall, and a product manufactured under both type and production certificates may, be required to undergo inspection by a representative of, or a person designated by the Administrator, to determine whether individual products conform with the provisions of the pertinent type certificate.

(b) A representative of the Administrator shall be permitted to make such inspections as may be necessary to determine compliance with the requirements of this part.

§ 2.34 Statement of conformity. The holder of a type certificate or of a current right to the benefits of a type certificate under a licensing arrangement, upon the initial transfer by him of

RULES AND REGULATIONS

the ownership of any aircraft manufactured under such type certificate, shall furnish to a duly authorized representative of the Administrator a statement of conformity for such aircraft on a form prescribed by the Administrator, except that a statement of conformity shall not be required if the aircraft is manufactured for United States registry under the terms of a production certificate.

[Amdt. 02-0, 11 F. R. 7032, as amended by Amdt. 02-1, 12 F. R. 949]

§ 2.35 *Production reports.* On the 1st day of January and July of each year, and at such other times as the Administrator may require, every holder of a production certificate, a type certificate, or a current right to the benefits of a type certificate under a licensing arrangement, shall transmit to the Administrator a detailed production report on a form prescribed and furnished by the Administrator. Such reports shall be transmitted whether or not any product has been manufactured during the period covered by the report.

§ 2.36 *Identification.* Each article manufactured under the terms of a type or production certificate shall display permanently such data as may be required to show its identity. Such data shall include at least the following items where applicable:

- (a) Manufacturer's name.
- (b) Type certificate number.
- (c) Production certificate number.
- (d) Model designation.
- (e) Manufacturer's serial number when article is serially numbered, or the date of manufacture, except where both are specifically required.
- (f) Capacity or rating.

PART 3—AIRPLANE AIRWORTHINESS; NORMAL, UTILITY, ACROBATIC, AND RESTRICTED-PURPOSE CATEGORIES

SUBPART A—AIRWORTHINESS REQUIREMENTS

GENERAL

- | | |
|------|------------------------|
| Sec. | |
| 3.1 | Scope. |
| 3.2 | Date of effectiveness. |

AIRPLANE CATEGORIES

- | | |
|-----|----------------------------|
| 3.6 | Airplane categories. |
| | AIRWORTHINESS CERTIFICATES |

- | | |
|------|-----------------|
| 3.11 | Classification. |
|------|-----------------|

TYPE CERTIFICATES

- | | |
|------|---|
| 3.15 | Requirements for issuance. |
| 3.16 | Data required for NC and NR certification. |
| 3.17 | Inspection and tests for NC and NR certification. |
| 3.18 | Inspection. |
| 3.19 | Flight tests. |

CHANGES

- | | |
|---------|--|
| 3.23 | Changes. |
| 3.23-11 | Changes of engines (CAA policies which apply to § 3.23). |
| 3.24 | Minor changes. |
| 3.25 | Major changes. |
| 3.26 | Service experience changes. |
| 3.27 | Application to earlier airworthiness requirements. |

APPROVAL OF MATERIALS, PARTS, PROCESSES, AND APPLIANCES

- | | |
|------|-----------------|
| 8.31 | Specifications. |
|------|-----------------|

DEFINITIONS

- | | |
|------|----------------------|
| 8.41 | Standard atmosphere. |
| 3.42 | Hot-day condition. |

- | | |
|--------|---|
| Sec. | |
| 3.43 | Airplane configuration. |
| 3.44 | Weights. |
| 3.45 | Power. |
| 3.46 | Speeds. |
| 3.47 | Structural terms. |
| 3.48 | Susceptibility of materials to fire. |
| 3.48-1 | Fire-resistant aircraft material (CAA rules which apply to § 3.48). |

SUBPART B—FLIGHT REQUIREMENTS

GENERAL

- | | |
|------|---------------------------------------|
| 3.61 | Policy re proof of compliance. |
| 3.62 | Flight test pilot. |
| 3.63 | Noncompliance with test requirements. |
| 3.64 | Emergency egress. |
| 3.65 | Report. |

WEIGHT RANGE AND CENTER OF GRAVITY

- | | |
|------|-----------------------------|
| 3.71 | Weight and balance. |
| 3.72 | Use of ballast. |
| 3.73 | Empty weight. |
| 3.74 | Maximum weight. |
| 3.75 | Minimum weight. |
| 3.76 | Center of gravity position. |

PERFORMANCE REQUIREMENTS

GENERAL

- | | |
|--------|--|
| 3.81 | Performance. |
| 3.82 | Definition of stalling speeds. |
| 3.82-1 | "Zero thrust" (CAA interpretations which apply to § 3.82). |
| 3.83 | Stalling speed. |
| 3.83-1 | Stalling speed of "not to exceed 70 miles per hour" (CAA interpretations which apply to § 3.83). |

TAKE-OFF

- | | |
|--------|--|
| 3.84 | Take-off. |
| 3.84-1 | Take-off performance (CAA policies which apply to § 3.84). |

CLIMB

- | | |
|--------|--|
| 3.85 | Climb. |
| 3.85-1 | Rate of climb (CAA policies which apply to § 3.85). |
| 3.85-2 | "Normal climb" and "cooling test procedure for single-engine airplanes" (CAA interpretations which apply to § 3.85). |
| 3.85-3 | "Rapid retraction" (CAA interpretations which apply to § 3.85). |
| 3.85-4 | Weight for items of performance and flight characteristics (CAA interpretations which apply to § 3.85). |

LANDING

- | | |
|--------|---|
| 3.86 | Landing. |
| 3.86-1 | Landing distances (CAA policies which apply to § 3.86). |

FLIGHT CHARACTERISTICS

- | | |
|-------|---------------|
| 2.105 | Requirements. |
|-------|---------------|

CONTROLLABILITY

- | | |
|---------|-------------------------------------|
| 3.106 | General. |
| 3.107-U | Approved acrobatic maneuvers. |
| 3.108-A | Acrobatic maneuvers. |
| 3.109 | Longitudinal control. |
| 3.110 | Lateral and directional control. |
| 3.111 | Minimum control speed (V_{mc}). |

TRIM

- | | |
|---------|--|
| 3.112 | Requirements. |
| 3.112-1 | Performance as alternate test (CAA policies which apply to § 3.112). |

STABILITY

- | | |
|---------|--|
| 3.113 | General. |
| 3.114 | Static longitudinal stability. |
| 3.115 | Specific conditions. |
| 3.116 | Instrumented stick force measurements. |
| 3.117 | Dynamic longitudinal stability. |
| 3.118 | Directional and lateral stability. |
| 3.118-1 | Test conditions (CAA policies which apply to § 3.118 (a)). |

STALLS

- | | |
|---------|--|
| Sec. | |
| 3.120 | Stalling demonstration. |
| 3.120-1 | Measuring loss of altitude during stall (CAA policies which apply to § 3.120). |
| 3.121 | Climbing stalls. |
| 3.122 | Turning flight stalls. |
| 3.123 | One-engine-inoperative stalls. |

SPINNING

- | | |
|-------|-----------|
| 3.124 | Spinning. |
|-------|-----------|

GROUND AND WATER CHARACTERISTICS

- | | |
|-------|-------------------------------------|
| 3.143 | Requirements. |
| 3.144 | Longitudinal stability and control. |
| 3.145 | Directional stability and control. |
| 3.146 | Shock absorption. |
| 3.147 | Spray characteristics. |

FLUTTER AND VIBRATION

- | | |
|-------|------------------------|
| 3.159 | Flutter and vibration. |
|-------|------------------------|

SUBPART C—STRENGTH REQUIREMENTS

GENERAL

- | | |
|---------|--|
| 3.171 | Loads. |
| 3.172 | Factor of safety. |
| 3.173 | Strength and deformations. |
| 3.173-1 | Dynamic tests (CAA policies which apply to § 3.173). |
| 3.174 | Proof of structure. |

FLIGHT LOADS

- | | |
|-------|-----------------------------------|
| 3.181 | General. |
| 3.182 | Definition of flight load factor. |

SYMMETRICAL FLIGHT CONDITIONS (FLAPS RETRACTED)

- | | |
|---------|--|
| 3.183 | General. |
| 3.184 | Design air speeds. |
| 3.185 | Maneuvering envelope. |
| 3.186 | Maneuvering load factors. |
| 3.186-1 | Use of reduced maneuvering load factors (CAA policies which apply to § 3.186). |
| 3.187 | Gust envelope. |
| 3.188 | Gust load factors. |
| 3.188-1 | "Slope of lift curve" (CAA interpretations which apply to § 3.188). |
| 3.189 | Airplane equilibrium. |

FLAPS EXTENDED FLIGHT CONDITIONS

- | | |
|-------|-----------------------------------|
| 3.190 | Flaps extended flight conditions. |
|-------|-----------------------------------|

UNSYMMETRICAL FLIGHT CONDITIONS

- | | |
|---------|---|
| 3.191 | Unsymmetrical flight conditions. |
| 3.191-1 | Alleron rolling conditions (CAA policies which apply to § 3.191 (a)). |

SUPPLEMENTARY CONDITIONS

- | | |
|-------|--|
| 3.194 | Special condition for rear lift truss. |
| 3.195 | Engine torque effects. |
| 3.196 | Side load on engine mount. |

CONTROL SURFACE LOADS

- | | |
|---------|--|
| 3.211 | General. |
| 3.212 | Pilot effort. |
| 3.212-1 | Automatic pilot systems (CAA policies which apply to § 3.212). |
| 3.213 | Trim tab effects. |

HORIZONTAL TAIL SURFACES

- | | |
|-------|---------------------------|
| 3.214 | Horizontal tail surfaces. |
| 3.215 | Balancing loads. |
| 3.216 | Maneuvering loads. |
| 3.217 | Gust loads. |
| 3.218 | Unsymmetrical loads. |

VERTICAL TAIL SURFACES

- | | |
|-------|--------------------|
| 3.219 | Maneuvering loads. |
| 3.220 | Gust loads. |
| 3.221 | Outboard fins. |

AILERONS, WING FLAPS, TABS, ETC.

- | | |
|-------|------------------|
| 3.222 | Ailerons. |
| 3.223 | Wing flaps. |
| 3.224 | Tabs. |
| 3.225 | Special devices. |

CONTROL SYSTEM LOADS		EMERGENCY PROVISIONS	
Sec.	3.305	Sec.	3.386
3.231	Primary flight controls and systems.	3.386	Protection.
3.231-1	Hinge moments (CAA policies which apply to § 3.231).	3.387	Exits.
3.231-2	System limit loads (CAA policies which apply to § 3.231).	3.388	Fire precautions.
3.232	Dual controls.	3.388-1	Combustion heaters (CAA rules which apply to § 3.388 (b)).
3.233	Ground gust conditions.	PERSONNEL AND CARGO ACCOMMODATIONS	
3.233-1	Ground gust loads (CAA policies which apply to § 3.233).	3.389	Doors.
3.234	Secondary controls and systems.	3.390	Seats and berths.
GROUND LOADS		3.391	Safety belt or harness provisions.
3.241	Ground loads.	3.392	Cargo compartments.
3.242	Design weight.	3.393	Ventilation.

SUBPART H—IDENTIFICATION DATA

3.791	Name plate.
3.792	Airworthiness certificate number.

AUTHORITY: §§ 3.1 to 3.792 issued under sec. 205 (a), 52 Stat. 984; 49 U. S. C. 425 (a). Interpret or apply sec. 601, 52 Stat. 1007; 49 U. S. C. 551.

SOURCE: §§ 3.1 to 3.792 contained in Amendment 03-0, Civil Air Regulations, 11 F. R. 13368, except as noted following sections affected. Redesignated at 13 F. R. 5486.

SUBPART A—AIRWORTHINESS REQUIREMENTS

GENERAL

§ 3.1 *Scope.* An airplane which has no features or characteristics rendering it unsafe for the category for which it is to be certificated is eligible for type and airworthiness certification, if it complies with all applicable provisions of this part, or, in the event it does not so comply, if it is shown to meet the same level of safety as that provided for in this part.

§ 3.2 *Date of effectiveness.* (a) Airplanes certificated as a type on or after November 13, 1945, shall comply either with (1) the entire provisions of Part 4a of this chapter in effect immediately prior to November 9, 1945, or (2) the entire provisions prescribed in this part, except that airplanes certificated under (1) may incorporate provisions of (2) when the Administrator finds the standard of safety to be equivalent to the particular and all related items of the latter.

(b) Airplanes certificated as a type on or after January 1, 1947, shall comply with the provisions contained in this part. If the prototype is not flown prior to January 1, 1947, and satisfactory evidence is presented indicating that the design work of the type was well advanced prior to November 13, 1945, and the delay of completion of the airplane was due to causes beyond the manufacturer's control, the Administrator may certificate the airplane as a type under the provisions of Part 4a of this chapter which were in effect prior to November 9, 1945.

(c) Unless otherwise specified, compliance with an amendment to this part shall be mandatory only for airplanes for which application for a type certificate has been received subsequent to the effective date of such amendment.

AIRPLANE CATEGORIES

§ 3.6 *Airplane categories.* (a) In this part airplanes are divided upon the basis of their intended operation into the following categories for the purpose of certification.

(1) *Normal—Suffix "N".* Airplanes in this category are intended for nonacrobatic, nonscheduled passenger, and non-scheduled cargo operation.

(2) *Utility—Suffix "U".* Airplanes in this category are intended for normal operations and limited acrobatic maneuvers. These airplanes are not suited for use in snap or inverted maneuvers.

NOTE: The following interpretation of paragraph (a) (2) was issued May 15, 1947, 12 F. R. 3434:

The phrase "limited acrobatic maneuvers" as used in § 3.6 is interpreted to include steep turns, spins, stalls (except whip stalls), lazy eights, and chandelles.

(3) *Acrobatic—Suffix "A".* Airplanes in this category will have no specific restrictions as to type of maneuver permitted unless the necessity therefor is disclosed by the required flight tests.

(4) *Restricted purpose—Suffix "R".* Airplanes in this category are intended to be operated for restricted purposes not logically encompassed by the foregoing categories. The requirements of this category shall consist of all of the provisions for any one of the foregoing categories which are not rendered inapplicable by the nature of the special purpose involved, plus suitable operating restrictions which the Administrator finds will provide a level of safety equivalent to that contemplated for the foregoing categories.

(b) An airplane may be certificated under the requirements of a particular category, or in more than one category, provided that all of the requirements of such categories are met. Sections of this part which apply to only one or more, but not all, categories are identified in this part by the appropriate suffixes, as indicated above, added to the section number. All sections not identified by a suffix are applicable to all categories except as otherwise specified.

NOTE: For rules governing the eligibility of airplanes certificated under this part for use in air carrier operations see Parts 40, 41, 42, and 61 of this chapter.

AIRWORTHINESS CERTIFICATES

§ 3.11 *Classification.* (a) Airworthiness certificates are classified as follows:

(1) *NC (standard) certificates.* In order to become eligible for an NC (standard) certificate, an airplane must be shown to comply with the requirements contained in this part for at least one category, but not the restricted-purpose category.

(2) *NR (restricted) certificates.* In order to become eligible for an NR (restricted) certificate, an airplane must be shown to comply with the requirements of the restricted purpose category.

(3) *NX (experimental) certificates.* An airplane will become eligible for an NX (experimental) certificate when the applicant presents satisfactory evidence that the airplane is to be flown for experimental purposes and the Administrator finds it may, with appropriate restrictions, be operated for that purpose in a manner which does not endanger the general public. Airplanes used in racing and exhibition flying may be issued NX (experimental) certificates under the terms of this section. The applicant shall

submit sufficient data, such as photographs, to identify the airplane satisfactorily and, upon inspection of the airplane, any pertinent information found necessary by the Administrator to safeguard the general public.

(b) An airplane manufactured in accordance with a type certificate (see §§ 3.15-3.19) and conforming with the type design will become eligible for an airworthiness certificate when, upon inspection of the airplane, the Administrator determines it so to conform and that the airplane is in a condition for safe operation. For each newly manufactured airplane this determination shall include a flight check by the applicant.

[Amdt. 03-0, 11 F. R. 13368, as amended by Amdt. 03-4, 13 F. R. 2965]

TYPE CERTIFICATES

§ 3.15 *Requirements for issuance.* A type certificate will be issued when the following requirements of §§ 3.16 to 3.19 are met.

§ 3.16 *Data required for NC and NR certification.* The applicant for a type certificate shall submit to the Administrator such descriptive data, test reports, and computations as are necessary to demonstrate that the airplane complies with the airworthiness requirements. The descriptive data shall be known as the type design and shall consist of drawings and specifications disclosing the configuration of the airplane and all design features covered in the airworthiness requirements as well as sufficient information on dimensions, materials, and processes to define the strength of the structure. The type design shall describe the airplane in sufficient detail to permit the airworthiness of subsequent airplanes of the same type to be determined by comparison with the type design.

[Amdt. 03-0, 11 F. R. 13368, as amended by Amdt. 03-4, 13 F. R. 2965]

§ 3.17 *Inspection and tests for NC and NR certification.* The authorized representatives of the Administrator shall have access to the airplane and may witness or conduct such inspections and tests as are necessary to determine compliance with the airworthiness requirements.

[Amdt. 03-0, 11 F. R. 13368, as amended by Amdt. 03-4, 13 F. R. 2965]

§ 3.18 *Inspection.* Inspections and tests shall include all those found necessary by the Administrator to insure that the airplane conforms with the following:

(a) All materials and products are in accordance with the specification given in the type design.

(b) All parts of the airplane are constructed in accordance with the drawings contained in the type design.

(c) All manufacturing processes, construction, and assembly are such that the design strength and safety contemplated by the type design will be realized in service.

§ 3.19 *Flight tests.* (Applicable to all airplanes certificated as a type on or after May 15, 1947.) After proof of

compliance with the structural requirements contained in this part, and upon completion of all necessary inspection and testing on the ground, and proof of the conformity of the airplane with the type design, and upon receipt from the applicant of a report of flight tests conducted by him, there shall be conducted such official flight tests as the Administrator finds necessary to determine compliance with §§ 3.61 through 3.780. After the conclusion of these flight tests such additional flight tests shall be conducted as the Administrator finds necessary to ascertain whether there is reasonable assurance that the airplane, its components, and equipment are reliable and function properly. The extent of such additional flight tests shall depend upon the complexity of the airplane, the number and nature of new design features, and the record of previous tests and experience for the particular airplane model, its components, and equipment. If practicable, the flight tests performed for the purpose of ascertaining the reliability and proper functioning shall be conducted on the same airplane which was used in flight tests to show compliance with §§ 3.61 through 3.780.

[Amdt. 03-1, 12 F. R. 1028, as amended by Amdt. 03-2, 12 F. R. 2086]

CHANGES

§ 3.23 *Changes.* Changes shall be substantiated to demonstrate compliance of the airplane with the appropriate airworthiness requirements in effect when the particular airplane was certificated as a type, unless the holder of the type certificate chooses to show compliance with the currently effective requirements subject to the approval of the Administrator, or unless the Administrator finds it necessary to require compliance with current airworthiness requirements.

§ 3.23-11 *Changes of engines (CAA policies which apply to § 3.23).* There are currently available newly designed engines of approximately the same size and weight as previously designed engines, but with considerable variations in power. It is possible to interchange these engines with little or no installation changes, and although minor changes in engine weight may be involved, it will still be practical to operate the aircraft at the originally approved gross weight. Under § 3.185, the maneuvering load factor is not dependent upon engine power, and under § 3.184, the design air speeds can be independent of engine power. Therefore, a change which involves or permits a practical power increase by exchange of engines shall be approved by the Administrator: *Provided*, That such exchange of engines is not accompanied by increase in the gross weight of the aircraft or an increase in placard speeds. Under these conditions it will not be necessary to restrict the maximum continuous horsepower by a placard because of the airplane speed limitations, since the latter are indicated on the speed placards. Aircraft alterations involving weight or speed changes beyond those set forth above will be approved by the Administrator only if the applicant shows compliance with all of the applicable sec-

tions of Part 4a of this chapter, or all of the applicable sections of Part 3, or relies on the provisions of § 3.2 by complying with certain particular and related items of the requirements under this part, and certain of the requirements under Part 4a of this chapter, i. e., the level of safety for certain particular and related items is equivalent to the requirements under this part and the level of safety for the remaining items is equivalent to the requirements under Part 4a of this chapter. Under § 3.23 it will be necessary to require such investigations of local structure, weight and balance, power-plant installations, and flight tests as are normally involved in a change of engine type.

[12 F. R. 3434. Correction noted at 14 F. R. 36]

§ 3.24 *Minor changes.* Minor changes to certificated airplanes which obviously do not impair the condition of the airplane for safe operation shall be approved by the authorized representatives of the Administrator prior to the submission to the Administrator of any required revised drawings.

§ 3.25 *Major changes.* A major change is any change not covered by minor changes as defined in § 3.24.

§ 3.26 *Service experience changes.* When experience shows that any particular part or characteristic of an airplane is unsafe, the holder of the type certificate for such airplane shall submit for approval of the Administrator the design changes which are necessary to correct the unsafe condition. After the unsafe condition becomes known the Administrator shall withhold the issuance of airworthiness certificates for additional airplanes of the type involved until he has approved the design changes and until the additional airplanes are modified to include such changes. Upon approval by the Administrator the design changes shall be considered as a part of the type design, and descriptive data covering these changes shall be made available by the holder of the type certificate to all owners of airplanes previously certificated under such type certificate.

§ 3.27 *Application to earlier airworthiness requirements.* In the case of airplanes approved as a type under the terms of earlier airworthiness requirements, the Administrator may require that an airplane submitted for an original airworthiness certificate comply with such portions of the currently effective airworthiness requirements as may be necessary for safety.

APPROVAL OF MATERIALS, PARTS, PROCESSES, AND APPLIANCES

§ 3.31 *Specifications.* (a) Materials, parts, processes, and appliances shall be approved upon a basis and in a manner found necessary by the Administrator to implement the pertinent provisions of this subchapter. The Administrator may adopt and publish such specifications as he finds necessary to administer this section, and shall incorporate therein such portions of the aviation industry, Federal, and military specifications respecting such materials, parts,

processes, and appliances as he finds appropriate.

(b) Any material, part, process, or appliance shall be deemed to have met the requirements for approval when it meets the pertinent specifications adopted by the Administrator, and the manufacturer so certifies in a manner prescribed by the Administrator.

[Amdt. 03-3, 12 F. R. 7898]

DEFINITIONS

§ 3.41 *Standard atmosphere.* The standard atmosphere shall be based upon the following assumptions:

(a) The air is a dry perfect gas.
(b) The temperature at sea level is 59° F.

(c) The pressure at sea level is 29.92 inches Hg.

(d) The temperature gradient from sea level to the altitude at which the temperature becomes -67° F. is -0.003566° F. per foot and zero thereafter.

(e) The density ρ_0 at sea level under the above conditions is 0.002378 lbs. sec.²/ft.³.

§ 3.42 *Hot-day condition.* See § 3.583.

§ 3.43 *Airplane configuration.* This term refers to the position of the various elements affecting the aerodynamic characteristics of the airplane, such as landing gear and flaps.

§ 3.44 *Weights.*

Reference sections

Empty weight: The actual weight used as a basis for determining operating weights.....	3.73
Maximum weight: The maximum weight at which the airplane may operate in accordance with the airworthiness requirements.....	3.74
Minimum weight: The minimum weight at which compliance with the airworthiness requirements is demonstrated.....	3.75
Maximum design weight: The maximum weight used for the structural design of the airplane.....	3.181
Minimum design weight: The minimum weight condition investigated in the structural flight load conditions, not greater than the minimum weight specified in § 3.75.....	3.181
Design landing weight: The weight used in the structural investigation of the airplane for normal landing conditions. Under the provisions of § 3.242, this weight may be equal to or less than the maximum design weight.....	3.242
Unit weights for design purposes:	
Gasoline..... 6 pounds per United States gallon.	
Lubricating oil... 7.5 pounds per United States gallon.	
Crew and passengers... 170 pounds per person.	

§ 3.45 *Power.*

One horsepower: 33,000 foot-pounds per minute.

Take-off power: The take-off rating of the engine established in accordance with Part 13, Aircraft Engine Airworthiness.

Maximum continuous power: The maximum continuous rating of the engine established in accordance with Part 13, Aircraft Engine Airworthiness.

§ 3.46 *Speeds.*

V_i True air speed of the airplane relative to the undisturbed air.

In the following symbols having subscripts, V denotes:

- (a) "Equivalent" air speed for structural design purposes equal to $V_t \sqrt{\rho/\rho_0}$.
 (b) "True indicated" or "calibrated" air speed for performance and operating purposes equal to indicator reading corrected for position and instrument errors.

	Reference sections
V_{t0} stalling speed, in the land configuration	3.82
V_{t1} stalling speed in the configurations specified for particular conditions	3.82
V_{t2} computed stalling speed at design landing weight with flaps fully deflected	3.190
V_z speed for best angle of climb.	
V_y speed for best rate of climb.	
V_{mc} minimum control speed	3.111
V_f design speed for flight load conditions with flaps in landing position	3.190
V_{fe} flaps-extended speed	3.742
V_p design maneuvering speed	3.184
V_c design cruising speed	3.184
V_d design dive speed	3.184
V_{ne} never-exceed speed	3.739
V_{no} maximum structural cruising speed	3.740
V_h maximum speed in level flight at maximum continuous power.	

§ 3.47 Structural terms.

Structure: Those portions of the airplane the failure of which would seriously endanger the safety of the airplane.

Design wing area, S : The area enclosed by the wing outline (including ailerons, and flaps in the retracted position, but ignoring fillets and fairings) on a surface containing the wing chords. The outline is assumed to extend through the nacelles and fuselage to the centerline of symmetry.

Aerodynamic coefficients: C_L , C_N , C_M , etc., used in this part, are nondimensional coefficients for the forces and moments acting on an airfoil, and correspond to those adopted by the United States National Advisory Committee for Aeronautics.

C_L —airfoil lift coefficient.

C_N —airfoil normal force coefficient (normal to wing chord line).

C_{NA} —airplane normal force coefficient (based on lift of complete airplane and design wing area).

C_M —pitching moment coefficient.

Loads	Reference sections
Limit load: The maximum load anticipated in service	3.171
Ultimate load: The maximum load which a part of structure must be capable of supporting	3.173
Factor of safety: The factor by which the limit load must be multiplied to establish the ultimate load	3.172

Load factor or acceleration factor, n : The ratio of the force acting on a mass to the weight of the mass. When the force in question represents the net external load acting on the airplane in a given direction, n represents the acceleration in that direction in terms of the gravitational constant.

Limit load factor: The load factor corresponding to limit load.

Ultimate load factor: The load factor corresponding to ultimate load.

§ 3.48 Susceptibility of materials to fire. Where necessary for the purpose of determining compliance with any of the definitions in this section, the Administrator shall prescribe the heat conditions and testing procedures which any

specific material or individual part must meet.

(a) **Fireproof.** "Fireproof" material means a material which will withstand heat equally well or better than steel in dimensions appropriate for the purpose for which it is to be used. When applied to material and parts used to confine fires in designated fire zones "fireproof" means that the material or part will perform this function under the most severe conditions of fire and duration likely to occur in such zones.

(b) **Fire-resistant.** When applied to sheet or structural members, "fire-resistant" material shall mean a material which will withstand heat equally well or better than aluminum alloy in dimensions appropriate for the purpose for which it is to be used. When applied to fluid-carrying lines, this term refers to a line and fitting assembly which will perform its intended protective functions under the heat and other conditions likely to occur at the particular location.

(c) **Flame-resistant.** "Flame-resistant" material means material which will not support combustion to the point of propagating, beyond safe limits, a flame after removal of the ignition source.

(d) **Flash-resistant.** "Flash-resistant" material means material which will not burn violently when ignited.

(e) **Inflammable.** "Inflammable" fluids or gases means those which will ignite readily or explode.

§ 3.48-1 Fire-resistant aircraft material (CAA rules which apply to § 3.48). See § 4b.448-3 of this chapter.

[13 F. R. 7723]

SUBPART B—FLIGHT REQUIREMENTS

GENERAL

§ 3.61 Policy re proof of compliance. Compliance with the requirements specified in this subpart governing functional characteristics shall be demonstrated by suitable flight or other tests conducted upon an airplane of the type, or by calculations based upon the test data referred to above, provided that the results so obtained are substantially equal in accuracy to the results of direct testing. Compliance with each requirement must be provided at the critical combination of airplane weight and center of gravity position within the range of either for which certification is desired. Such compliance must be demonstrated by systematic investigation of all probable weight and center of gravity combinations or must be reasonably inferable from such as are investigated.

§ 3.62 Flight test pilot. The applicant shall provide a person holding an appropriate pilot certificate to make the flight tests, but a designated representative of the Administrator may pilot the airplane insofar as that may be necessary for the determination of compliance with the airworthiness requirements.

§ 3.63 Noncompliance with test requirements. Official type tests will be discontinued until corrective measures have been taken by the applicant when either:

(a) The applicant's test pilot is unable or unwilling to conduct any of the required flight tests; or

(b) Items of noncompliance with requirements are found which may render additional test data meaningless or are of such nature as to make further testing unduly hazardous.

§ 3.64 Emergency egress. Adequate provisions shall be made for emergency egress and use of parachutes by members of the crew during the flight tests.

§ 3.65 Report. The applicant shall submit to the representative of the Administrator a report covering all computations and tests required in connection with calibration of instruments used for test purposes and correction of test results to standard atmospheric conditions. The representative of the Administrator will conduct any flight tests which he finds to be necessary in order to check the calibration and correction report.

WEIGHT RANGE AND CENTER OF GRAVITY

§ 3.71 Weight and balance. (a) There shall be established, as a part of the type inspection, ranges of weight and center of gravity within which the airplane may be safely operated.

(b) When low fuel adversely affects balance or stability, the airplane shall be so tested as to simulate the condition existing when the amount of usable fuel on board does not exceed 1 gallon for every 12 maximum continuous horsepower of the engine or engines installed.

§ 3.72 Use of ballast. Removable ballast may be used to enable airplanes to comply with the flight requirements in accordance with the following provisions:

(a) The place or places for carrying ballast shall be properly designed, installed, and plainly marked as specified in § 3.766.

(b) The Airplane Flight Manual shall include instructions regarding the proper disposition of the removable ballast under all loading conditions for which such ballast is necessary, as specified in § 3.755-3.770.

§ 3.73 Empty weight. The empty weight and corresponding center of gravity location shall include all fixed ballast, the unusable fuel supply (see § 3.437), undrainable oil, full engine coolant, and hydraulic fluid. The weight and location of items of equipment installed when the airplane is weighed shall be noted in the Airplane Flight Manual.

§ 3.74 Maximum weight. The maximum weight shall not exceed any of the following:

(a) The weight selected by the applicant.

(b) The design weight for which the structure has been proven.

(c) The maximum weight at which compliance with all of the requirements specified is demonstrated, and shall not be less than the sum of the weights of the following:

(1) The empty weight as defined by § 3.73.

(2) One gallon of usable fuel (see § 3.437) for every seven maximum continuous horsepower for which the airplane is certificated.

(3) The full oil capacity.

(4) 170 pounds in all seats (normal category) or 190 pounds in all seats (utility and acrobatic category) unless placarded otherwise.

§ 3.75 *Minimum weight.* The minimum weight shall not exceed the sum of the weights of the following:

(a) The empty weight as defined by § 3.73.

(b) The minimum crew necessary to operate the airplane (170 pounds for each crew member).

(c) One gallon of usable fuel (see § 3.437) for every 12 maximum continuous horsepower for which the airplane is certificated.

(d) Either 1 gallon of oil for each 25 gallons of fuel specified in (c) or 1 gallon of oil for each 75 maximum continuous horsepower for which the airplane is certificated, whichever is greater.

§ 3.76 *Center of gravity position.* If the center of gravity position under any possible loading condition between the maximum weight as specified in § 3.74 and the minimum weight as specified in § 3.75 lies beyond (a) the extremes selected by the applicant, or (b) the extremes for which the structure has been proven, or (c) the extremes for which compliance with all functional requirements were demonstrated, loading instructions shall be provided in the Airplane Flight Manual as specified in § 3.777-3.780.

PERFORMANCE REQUIREMENTS

GENERAL

§ 3.81 *Performance.* The following items of performance shall be determined and the airplane shall comply with the corresponding requirements in standard atmosphere and still air.

§ 3.82 *Definition of stalling speeds.*

(a) V_{S0} denotes the true indicated stalling speed, if obtainable, or the minimum steady flight speed at which the airplane is controllable, in miles per hour, with:

(1) Engines idling, throttles closed (or not more than sufficient power for zero thrust),

(2) Propellers in position normally used for take-off,

(3) Landing gear extended,

(4) Wing flaps in the landing position,

(5) Cowl flaps closed,

(6) Center of gravity in the most unfavorable position within the allowable landing range,

(7) The weight of the airplane equal to the weight in connection with which V_{S0} is being used as a factor to determine a required performance.

(b) V_{S1} denotes the true indicated stalling speed, if obtainable, otherwise the calculated value in miles per hour, with:

(1) Engines idling, throttles closed (or not more than sufficient power for zero thrust),

(2) Propellers in position normally used for take-off, the airplane in all other respects (flaps, landing gear, etc.) in the particular condition existing in the particular test in connection with which V_{S1} is being used,

(3) The weight of the airplane equal to the weight in connection with which

V_{S1} is being used as a factor to determine a required performance.

(c) These speeds shall be determined by flight tests using the procedure outlined in § 3.120.

§ 3.82-1 *"Zero thrust"* (CAA interpretations which apply to § 3.82). As used in § 3.82 (a) (1) and (b) (1) the term "zero thrust" contained in the phrase "engines idling, throttles closed (or not more than sufficient power for zero thrust)" is interpreted to permit "zero thrust at a speed not greater than 110 percent of the stalling speed."

[12 F. R. 3434. Correction noted at 14 F. R. 36]

§ 3.83 *Stalling speed.* V_{S0} at maximum weight shall not exceed 70 miles per hour for (1) single-engine airplanes and (2) multiengine airplanes which do not have the rate of climb with critical engine inoperative specified in § 3.85 (b).

§ 3.83-1 *Stalling speed of "not to exceed 70 miles per hour"* (CAA interpretations which apply to § 3.83). In connection with any application to have an aircraft certificated for airworthiness under a combination of the requirements of this part and Part 4a of this chapter as authorized by the provisions of § 3.2, the stalling speed of "not to exceed 70 miles per hour" established in § 3.83 is interpreted to apply only to airplanes which comply with all of the following sections of the Civil Air Regulations which are construed by the Administrator to cover "related items": § 3.84 (Take-off); § 3.86 (Landing); § 3.120 (Stalling); § 3.121 (Climbing stalls); § 3.122 (Turning flight stalls); § 3.123 (One-engine-inoperative stalls); § 3.143 (Ground and water characteristics).

[12 F. R. 3434. Correction noted at 14 F. R. 36]

TAKE-OFF

§ 3.84 *Take-off.* (a) The distance required to take off and climb over a 50-foot obstacle shall be determined under the following conditions:

(1) Most unfavorable combination of weight and center of gravity location,

(2) Engines operating within the approved limitations,

(3) Cowl flaps in the position normally used for take-off,

(b) Upon obtaining a height of 50 feet above the level take-off surface, the airplane shall have attained a speed of not less than $1.3 V_{S1}$ unless a lower speed of not less than V_x plus 5 can be shown to be safe under all conditions, including turbulence and complete engine failure.

(c) The distance so obtained, the type of surface from which made, and the pertinent information with respect to the cowl flap position, the use of flight-path control devices and landing gear retraction system shall be entered in the Airplane Flight Manual. The take-off shall be made in such a manner that its reproduction shall not require an exceptional degree of skill on the part of the pilot or exceptionally favorable conditions.

§ 3.84-11 *Take-off performance* (CAA policies which apply to § 3.84). To meet the requirements of § 3.84 pertaining to certification of take-off performance and

to provide the Airplane Flight Manual performance data required in § 3.780 (a) (3) and (4), it is necessary that a suitable method be used for the purpose of determining these items during official type tests. The Administrator will accept the following procedure for this purpose:

The ground and climb distances may be determined separately and the corrected data placed together (as is now done in the transport category). Thus, for the simplest procedure, the airplane shall be accelerated on (or near) the ground with gear extended to a speed not less than $1.3 V_{S1}$, and a climb segment to the 50-foot height point with gear extended shall be determined by saw-tooth climb data. If it is desired to assume retraction of the landing gear at an earlier point, such point shall be assured to occur not earlier than that which would be used in normal take-offs. The acceleration to $1.3 V_{S1}$ shall then be measured as above, with gear retraction being initiated at the selected speed. If gear retraction is completed before reaching $1.3 V_{S1}$, only one climb segment, with gear retracted, need be determined. If retraction is not completed during acceleration to $1.3 V_{S1}$, two climb segments shall be determined; one with gear extended for the time period necessary to complete retraction; the second with gear retracted. The acceleration segment shall be determined photographically, and a minimum of three trials shall be made up to speeds equal to or greater than $1.3 V_{S1}$.

NOTE: It is permissible for other methods to be used in accomplishing these tests, providing that any method used is one which the average pilot may be reasonably expected to duplicate without use of unusual skill or experience, and one which produces equivalent accuracy. The operating procedure which must be followed to achieve the measured performance shall in all cases be described in the Airplane Flight Manual. (CAA camera equipment may be obtained on a loan basis.)

[12 F. R. 3434. Correction noted at 14 F. R. 36]

CLIMB

§ 3.85 *Climb*—(a) *Normal climb condition.* The steady rate of climb at sea level shall be at least 300 feet per minute, and the steady angle of climb at least 1:12 for landplanes or 1:15 for seaplanes with:

(1) Not more than maximum continuous power on all engines,

(2) Landing gear fully retracted,

(3) Wing flaps in take-off position,

(4) Cowl flaps in the position used in cooling tests specified in §§ 3.581-3.596.

(b) *Climb with inoperative engine.* All multiengine airplanes having a stalling speed V_{S0} greater than 70 miles per hour or a maximum weight greater than 6,000 pounds shall have a steady rate of climb of at least $0.02 V_{S0}^2$ in feet per minute at an altitude of 5,000 feet with the critical engine inoperative and:

(1) The remaining engines operating at not more than maximum continuous power,

(2) The inoperative propeller in the minimum drag position,

(3) Landing gear retracted,

(4) Wing flaps in the most favorable position,

(5) Cowl flaps in the position used in cooling tests specified in §§ 3.581-3.596.

(c) *Balked landing conditions.* The steady angle of climb at sea level shall be at least 1:30 with:

- (1) Take-off power on all engines,
- (2) Landing gear extended,
- (3) Wing flaps in landing position.

If rapid retraction is possible with safety without loss of altitude and without requiring sudden changes of angle of attack or exceptional skill on the part of the pilot, wing flaps may be retracted.

§ 3.85-1 *Rate of climb (CAA policies which apply to § 3.85).* To meet the requirements of § 3.85 it is necessary that a suitable method be employed for the purpose of determining the rates of climb. The Administrator will accept the following procedure for this purpose:

This method of obtaining rates of climb is through the derivation of a polar curve obtained from a series of saw-tooth climbs at various speeds. When saw-tooth climbs are employed, a minimum of five different speeds is required. However, demonstration climbs to prove the article meets the minimum climb requirement may be made at one given air speed. In such cases, the minimum number of climbs at one air speed shall be not less than three. This may not be interpreted to mean the best three of a number of climbs. In the event additional climbs are made the average of the total shall be the value to be accepted. It shall be permissible, however, to discard any climbs which are obviously in error due to such factors as turbulent air.

[12 F. R. 3434. Correction noted at 14 F. R. 36]

§ 3.85-2 *"Normal climb" and "cooling test procedure for single-engine airplanes" (CAA interpretations which apply to § 3.85).* In connection with any application to have an aircraft certified for airworthiness under a combination of the requirements of this part and Part 4a of this chapter as authorized by the provisions of § 3.2, the items of "normal climb" (§ 3.85 (a)) and "cooling test procedure for single-engine airplanes" (§ 3.586), shall be construed by the Administrator as "related items."

[12 F. R. 3435. Correction noted at 14 F. R. 36]

§ 3.85-3 *"Rapid retraction" (CAA interpretations which apply to § 3.85).* The Administrator will consider retraction of flaps in 2 seconds or less as compliance with the factor of "rapid retraction" as that phrase is used in § 3.85 (c).

[12 F. R. 3435. Correction noted at 14 F. R. 36]

§ 3.85-4 *Weight for items of performance and flight characteristics (CAA interpretations which apply to § 3.85).* For multiengine airplanes in which the design landing weight (§ 3.242) is less than the maximum weight (§ 3.74) for which certification is desired, the weight for items of performance and flight characteristics shall be construed by the Administrator as the maximum weight defined in § 3.74. Such items of performance and flight characteristics

shall consist of balked landing (climb) conditions (§ 3.74), landing over 50-foot obstacles (§ 3.86), and all flight characteristics tests in the landing configuration. The design weight covered in § 3.242 is intended for use for structural design purposes only.

[12 F. R. 3435. Correction noted at 14 F. R. 36]

LANDING

§ 3.86 *Landing.* (a) The horizontal distance required to land and to come to a complete stop (to a speed of approximately 3 miles per hour for seaplanes or float planes) from a point at a height of 50 feet above the landing surface shall be determined as follows:

(1) Immediately prior to reaching the 50-foot altitude, a steady gliding approach shall have been maintained, with a true indicated air speed of at least $1.3 V_{S_0}$.

(2) The landing shall be made in such a manner that there is no excessive vertical acceleration, no tendency to bounce, nose over, ground loop, porpoise, or water loop, and in such a manner that its reproduction shall not require any exceptional degree of skill on the part of the pilot or exceptionally favorable conditions.

(b) The distance so obtained, the type of landing surface on which made and the pertinent information with respect to cowl flap position, and the use of flight path control devices shall be entered in the Airplane Flight Manual.

§ 3.86-1 *Landing distances (CAA policies which apply to § 3.86).* The Administrator will not approve the use of landing distances obtainable with reverse-thrust propellers in establishing landing field lengths until such time as sufficient experience with their use is available for proper consideration of all related factors involved in the establishment of adequate airport lengths for routine landings.

[12 F. R. 3437. Correction noted at 14 F. R. 36]

FLIGHT CHARACTERISTICS

§ 3.105 *Requirements.* The airplane shall meet the requirements set forth in §§ 3.106 to 3.124 at all normally expected operating altitudes under all critical loading conditions within the range of center of gravity and, except as otherwise specified, at the maximum weight for which certification is sought.

CONTROLLABILITY

§ 3.106 *General.* The airplane shall be satisfactorily controllable and maneuverable during take-off, climb, level flight, drive, and landing with or without power. It shall be possible to make a smooth transition from one flight condition to another, including turns and slips, without requiring an exceptional degree of skill, alertness, or strength on the part of the pilot, and without danger of exceeding the limit load factor under all conditions of operation probable for the type, including for multiengine airplanes those conditions normally encountered in the event of sudden failure of any engine. Compliance with "strength of pilots" limits need not be demonstrated by quantitative tests un-

less the Administrator finds the condition to be marginal. In the latter case they shall not exceed maximum values found by the Administrator to be appropriate for the type but in no case shall they exceed the following limits:

	Pitch	Roll	Yaw
(a) For temporary application:			
Stick	60	30	180
Wheel	75	60	150
(b) For prolonged application:			
	40	5	20

¹ Applied to rim.

§ 3.107-U *Approved acrobatic maneuvers.* It shall be demonstrated that the approved acrobatic maneuvers can be performed safely. Safe entry speeds shall be determined for these maneuvers.

§ 3.108-A *Acrobatic maneuvers.* It shall be demonstrated that acrobatic maneuvers can be performed readily and safely. Safe entry speeds shall be determined for these maneuvers.

§ 3.109 *Longitudinal control.* The airplane shall be demonstrated to comply with the following requirements:

(a) It shall be possible at all speeds below V_x to pitch the nose downward so that the rate of increase in air speed is satisfactory for prompt acceleration to V_x with:

(1) Maximum continuous power on all engines, the airplane trimmed at V_x .

(2) Power off, the airplane trimmed at $1.4 V_{S_1}$.

(3) (i) Wing flaps and landing gear extended and

(ii) Wing flaps and landing gear retracted.

(b) During each of the controllability demonstrations outlined below it shall not require a change in the trim control or the exertion of more control force than can be readily applied with one hand for a short period. Each maneuver shall be performed with the landing gear extended.

(1) With power off, flaps retracted, and the airplane trimmed at $1.4 V_{S_1}$, the flaps shall be extended as rapidly as possible while maintaining the air speed at approximately 40 percent above the instantaneous value of the stalling speed.

(2) Same as subparagraph (1) of this paragraph, except the flaps shall be initially extended and the airplane trimmed at $1.4 V_{S_1}$, then the flaps shall be retracted as rapidly as possible.

(3) Same as subparagraph (2) of this paragraph, except maximum continuous power shall be used.

(4) With power off, the flaps retracted, and the airplane trimmed at $1.4 V_{S_1}$, take-off power shall be applied quickly while the same air speed is maintained.

(5) Same as subparagraph (4) of this paragraph, except with the flaps extended.

(6) With power off, flaps extended, and the airplane trimmed at $1.4 V_{S_1}$, air speeds within the range of $1.1 V_{S_1}$ to $1.7 V_{S_1}$ or V_I , whichever is the lesser, shall be obtained and maintained.

(c) It shall be possible without the use of exceptional piloting skill to maintain essentially level flight when flap retraction

tion from any position is initiated during steady horizontal flight at $1.1 V_{s1}$ with simultaneous application of not more than maximum continuous power.

§ 3.110 *Lateral and directional control.* (a) It shall be possible with multi-engine airplanes to execute 15-degree banked turns both with and against the inoperative engine from steady climb at $1.4 V_{s1}$ or V_y for the condition with:

- (1) Maximum continuous power on the operating engines,
- (2) Rearmost center of gravity,
- (3) (i) Landing gear retracted and
- (ii) Landing gear extended.
- (4) Wing flaps in most favorable climb position,
- (5) Maximum weight,
- (6) The inoperative propeller in its minimum drag condition.

(b) It shall be possible with multi-engine airplanes, while holding the wings level laterally within 5 degrees, to execute sudden changes in heading in both directions without dangerous characteristics being encountered. This shall be demonstrated at $1.4 V_{s1}$ or V_y up to heading changes of 15 degrees, except that the heading change at which the rudder force corresponds to that specified in § 3.106 need not be exceeded, with:

- (1) The critical engine inoperative,
- (2) Maximum continuous power on the operating engine(s),
- (3) (i) Landing gear retracted and
- (ii) Landing gear extended,
- (4) Wing flaps in the most favorable climb position,
- (5) The inoperative propeller in its minimum drag condition,
- (6) The airplane center of gravity at its rearmost position.

§ 3.111 *Minimum control speed (V_{mc}).* (a) A minimum speed shall be determined under the conditions specified below, such that when any one engine is suddenly made inoperative at that speed, it shall be possible to recover control of the airplane, with the one engine still inoperative, and to maintain it in straight flight at that speed, either with zero yaw or, at the option of the applicant, with a bank not in excess of 5 degrees. Such speed shall not exceed $1.3 V_{s1}$, with:

- (1) Take-off or maximum available power on all engines,
- (2) Rearmost center of gravity,
- (3) Flaps in take-off position,
- (4) Landing gear retracted.

(b) In demonstrating this minimum speed, the rudder force required to maintain it shall not exceed forces specified in § 3.106, nor shall it be necessary to throttle the remaining engines. During recovery the airplane shall not assume any dangerous attitude, nor shall it require exceptional skill, strength, or alertness on the part of the pilot to prevent a change of heading in excess of 20 degrees before recovery is complete.

TRIM

§ 3.112 *Requirements.* (a) The means used for trimming the airplane shall be such that, after being trimmed and without further pressure upon or movement of either the primary control or its corresponding trim control by the pilot or

the automatic pilot, the airplane will maintain:

(1) Lateral and directional trim in level flight at a speed of $0.9 V_h$ or at V_c , if lower, with the landing gear and wing flaps retracted;

(2) Longitudinal trim under the following conditions:

(i) During a climb with maximum continuous power at a speed between V_x and $1.4 V_{s1}$,

(a) With landing gear retracted and wing flaps retracted,

(b) With landing gear retracted and wing flaps in the take-off position.

(ii) During a glide with power off at a speed not in excess of $1.4 V_{s1}$,

(a) With landing gear extended and wing flaps retracted,

(b) With landing gear extended and wing flaps extended under the forward center of gravity position approved with the maximum authorized weight,

(c) With landing gear extended and wing flaps extended under the most forward center of gravity position approved, regardless of weight.

(iii) During level flight at any speed from $0.9 V_h$ to V_x or $1.4 V_{s1}$ with landing gear and wing flaps retracted.

(b) In addition to the above, multi-engine airplanes shall maintain longitudinal and directional trim at a speed between V_y and $1.4 V_{s1}$ during climbing flight with the critical of two or more engines inoperative, with:

- (1) The other engine(s) operating at maximum continuous power,
- (2) The landing gear retracted,
- (3) Wing flaps retracted,
- (4) Bank not in excess of 5 degrees.

§ 3.112-1 *Performance as alternate test (CAA policies which apply to § 3.112).* The following performance standards will be used for the purpose of administering § 3.112 (a) (2) (ii):

(a) In the case of new airplane designs which, due to their being equipped with high lift devices, cannot meet the required trim at 1.4 times stall speed with the landing gear and flaps extended, the Administrator, as authorized in § 3.1, will accept, as being of equivalent safety, performance with the flaps extended based on the following standards:

(1) The flap-down power-off stalling speed shall not exceed 90 percent of the flap-retracted power-off stalling speed.

(2) The minimum trim speed with power off, flaps and landing gear extended, under the forward center of gravity position approved with the maximum authorized weight, and under the most forward center of gravity position approved, regardless of weight, shall not exceed 1.5 times the stall speed for that configuration.

(3) The force required to maintain steady flight in this configuration at $1.4 V_{s1}$, shall not exceed 10 pounds.

(4) It shall be possible, trimmed in this configuration, to execute a normal power-off landing without exceeding a stick force of 40 pounds.

(5) It shall be possible, with the stick free, to reduce the rate of descent to zero and simultaneously bring the airplane to an attitude suitable for landing, using not more than maximum continuous

power. During this demonstration the flaps-extended speed shall not be exceeded.

(b) When the standards set forth above are relied upon to determine compliance with this section of the Civil Air Regulations, the Administrator will accept as equivalent safety a demonstration of the following items at 1.5 times stall speed instead of 1.4 times stall speed: Longitudinal control (§ 3.109 (a) and (b) (2), (5), and (6)). Specific conditions (§ 3.115 (a)).

[12 F. R. 3435. Correction noted at 14 F. R. 36]

STABILITY

§ 3.113 *General.* The airplane shall be longitudinally, directionally, and laterally stable in accordance with the following sections. Suitable stability and control "feel" (static stability) shall be required in other conditions normally encountered in service, if flight tests show such stability to be necessary for safe operation.

§ 3.114 *Static longitudinal stability.* In the configurations outlined in § 3.115 and with the airplane trimmed as indicated, the characteristics of the elevator control forces and the friction within the control system shall be such that:

(a) A pull shall be required to obtain and maintain speeds below the specified trim speed and a push to obtain and maintain speeds above the specified trim speed. This shall be so at any speed which can be obtained without excessive control force, except that such speeds need not be greater than the appropriate maximum permissible speed or less than the minimum speed in steady unstalled flight.

(b) The air speed shall return to within 10 percent of the original trim speed when the control force is slowly released from any speed within the limits defined in paragraph (a) of this section.

§ 3.115 *Specific conditions.* In conditions set forth in this section, within the speeds specified, the stable slope of stick force versus speed curve shall be such that any substantial change in speed is clearly perceptible to the pilot through a resulting change in stick force.

(a) *Landing.* The stick force curve shall have a stable slope and the stick force shall not exceed 40 lbs. at any speed between $1.1 V_{s1}$ and $1.8 V_{s1}$, with:

- (1) Wing flaps in the landing position,
- (2) The landing gear extended,
- (3) Maximum weight,
- (4) Throttles closed on all engines.
- (5) The airplane trimmed at $1.4 V_{s1}$ with throttles closed.

(b) *Climb.* The stick force curve shall have a stable slope at all speeds between $1.2 V_{s1}$ and $1.6 V_{s1}$ with:

- (1) Wing flaps retracted,
- (2) Landing gear retracted,
- (3) Maximum weight,
- (4) 75 percent of maximum continuous power,
- (5) The airplane trimmed at $1.4 V_{s1}$.

(c) *Cruising.* (1) Between $1.3 V_{s1}$ and the maximum permissible speed, the stick force curve shall have a stable slope at all speeds obtainable with a stick force not in excess of 40 pounds with:

- (i) Landing gear retracted,
- (ii) Wing flaps retracted,
- (iii) Maximum weight,
- (iv) 75 percent of maximum continuous power,
- (v) The airplane trimmed for level flight with 75 percent of the maximum continuous power.

(2) Same as subparagraph (1) of this paragraph, except that the landing gear shall be extended and the level flight trim speed need not be exceeded.

§ 3.116 *Instrumented stick force measurements.* Instrumented stick force measurements need not be made when changes in speed are clearly reflected by changes in stick forces and the maximum forces obtained in the above conditions are not excessive.

§ 3.117 *Dynamic longitudinal stability.* Any short period oscillation occurring between stalling speed and maximum permissible speed shall be heavily damped with the primary controls (1) free, and (2) in a fixed position.

§ 3.118 *Directional and lateral stability—(a) Three-control airplanes.* (1) The static directional stability, as shown by the tendency to recover from a skid with rudder free, shall be positive for all flap positions and symmetrical power conditions, and for all speeds from $1.2 V_{st}$ up to the maximum permissible speed.

(2) The static lateral stability as shown by the tendency to raise the low wing in a sideslip, for all flap positions and symmetrical power conditions, shall:

- (i) Be positive at the maximum permissible speed.
- (ii) Not be negative at a speed equal to $1.2 V_{st}$.

(3) In straight steady sideslips (unaccelerated forward slips), the aileron and rudder control movements and forces shall increase steadily, but not necessarily in constant proportion, as the angle of sideslip is increased; the rate of increase of the movements and forces shall lie between satisfactory limits up to sideslip angles considered appropriate to the operation of the type. At greater angles, up to that at which the full rudder control is employed or a rudder pedal force of 150 pounds is obtained, the rudder pedal forces shall not reverse and increased rudder deflection shall produce increased angles of sideslip. Sufficient bank shall accompany sideslipping to indicate adequately any departure from steady unyawed flight.

(4) Any short-period oscillation occurring between stalling speed and maximum permissible speed shall be heavily damped with the primary controls (1) free and (ii) in a fixed position.

(b) *Two-control (or simplified) airplanes.* (1) The directional stability shall be shown to be adequate by demonstrating that the airplane in all configurations can be rapidly rolled from a 45-degree bank to a 45-degree bank in the opposite direction without exhibiting dangerous skidding characteristics.

(2) Lateral stability shall be shown to be adequate by demonstrating that the airplane will not assume a dangerous attitude or speed when all the controls are abandoned for a period of 2 minutes.

This demonstration shall be made in moderately smooth air with the airplane trimmed for straight level flight at $0.9 V_{st}$ (or at V_{st} , if lower), flaps and gear retracted, and with rearward center of gravity loading.

(3) Any short period oscillation occurring between the stalling speed and the maximum permissible speed shall be heavily damped with the primary controls (i) free and (ii) in a fixed position.

§ 3.118-1 *Test conditions (CAA policies which apply to § 3.118 (a) (3)).* The tests made necessary in § 3.118 (a) (3) may be conducted at speeds up to 1.2 times stall speed, flaps up and down, and with power up to 75 percent of maximum continuous rating.

[12 F. R. 3435. Correction noted at 14 F. R. 36]

STALLS

§ 3.120 *Stalling demonstration.* (a) Stalls shall be demonstrated under two conditions:

- (1) With power off.
- (2) With the power setting not less than that required to show compliance with § 3.85 (a).

(b) In either condition it shall be possible, with flaps and landing gear in any position, with center of gravity in the position least favorable for recovery, and with appropriate airplane weights for:

- (1) Airplanes having independently controlled rolling and directional controls to produce and to correct roll by unreversed use of the rolling control and to produce and to correct yaw by unreversed use of the directional control during the maneuvers described below up to the time when the airplane pitches,
- (2) Two-control airplanes having either interconnected lateral and directional controls or providing only one of these controls to produce and to correct roll by unreversed use of the rolling control without producing excessive yaw during the maneuvers described below up to the time the airplane pitches.

(c) During the recovery portions of the maneuver, pitch shall not exceed 30 degrees below level, there shall be no loss of altitude in excess of 100 feet, and not more than 15 degrees roll or yaw shall occur when controls are not used for 1 second after pitch starts and are used thereafter only in a normal manner.

(d) Where clear and distinctive stall warning is apparent to the pilot at a speed at least 5 percent above the stalling speed with flaps and landing gear in any position, both in straight and turning flight, these requirements are modified as follows:

- (1) It shall be possible to prevent more than 15 degrees roll or yaw by the normal use of controls.
- (2) Any loss of altitude in excess of 100 feet or any pitch in excess of 30 degrees below level shall be entered in the Airplane Flight Manual.

(e) In demonstrating the qualities set forth in paragraph (d) of this section, the order of events shall be:

- (1) With trim controls adjusted for straight flight at a speed of approximately $1.4 V_{st}$, reduce speed by means of the elevator control until the speed is

steady at slightly above stalling speed, then

(2) Pull elevator control back at a rate such that the airplane speed reduction does not exceed 1 mile per hour per second until a stall is produced as evidenced by an uncontrollable downward pitching motion of the airplane, or until the control reaches the stop. Normal use of the elevator control for recovery may be made after such pitching motion is unmistakably developed.

§ 3.120-1 *Measuring loss of altitude during stall (CAA policies which apply to § 3.120).* To meet the requirements of § 3.120, pertaining to the maximum loss of altitude permitted during the stall, it is necessary that a suitable method be used for the purpose of measuring such loss during the investigation of stalls. Unless special features of an individual type being investigated render the following instructions inapplicable, the procedure described shall be used for this purpose:

(a) The standard procedure for approaching a stall shall be used as specified in § 3.120.

(b) The loss of altitude encountered in the stall (power on or power off) shall be the distance as observed on the sensitive altimeter testing installation from the moment the airplane pitches to the observed altitude reading at which horizontal flight has been regained.

(c) Power used during the recovery portions of a stall maneuver may be that which, at the discretion of the inspector, would be likely used by a pilot under normal operating conditions when executing this particular maneuver. However, the power used to regain level flight shall not be applied until the airplane has regained flying control at a speed of approximately $1.2 V_{st}$. This means that in the investigation of stalls with the critical engine inoperative, the power may be reduced on the operating engine(s) before reapplying power on the operating engine or engines for the purpose of regaining level flight.

[12 F. R. 3435. Correction noted at 14 F. R. 36]

§ 3.121 *Climbing stalls.* When stalled from an excessive climb attitude it shall be possible to recover from this maneuver without exceeding the limiting air speed or the allowable acceleration limit.

§ 3.122 *Turning flight stalls.* When stalled during a coordinated 30-degree banked turn with 75 percent maximum continuous power on all engines, flaps and landing gear retracted, it shall be possible to recover to normal level flight without encountering excessive loss of altitude, uncontrollable rolling characteristics, or uncontrollable spinning tendencies. These qualities shall be demonstrated by performing the following maneuver: After a steady curvilinear level coordinated flight condition in a 30-degree bank is established and while maintaining the 30-degree bank, the airplane shall be stalled by steadily and progressively tightening the turn with the elevator control until the airplane is stalled or until the elevator has reached its stop. When the stall has fully developed, re-

covery to level flight shall be made with normal use of the controls.

§ 3.123 *One-engine-inoperative stalls.* Multiengine airplanes shall not display any undue spinning tendency and shall be safely recoverable without applying power to the inoperative engine when stalled with:

- (a) The critical engine inoperative,
- (b) Flaps and landing gear retracted,
- (c) The remaining engines operating at up to 75 percent of maximum continuous power, except that the power need not be greater than that at which the use of maximum control travel just holds the wings laterally level in approaching the stall. The operating engines may be throttled back during the recovery from the stall.

SPINNING

§ 3.124 *Spinning—*(a) *Category N.* All airplanes of 4,000 pounds or less maximum weight shall recover from a one-turn spin with controls assisted to the extent necessary to overcome friction in not more than one and one-half additional turns and without exceeding either the limiting air speed or the limit positive maneuvering load factor for the airplane. It shall not be possible to obtain uncontrollable spins by means of any possible use of the controls. Compliance with the above shall be demonstrated at any permissible combination of weight and center of gravity positions obtainable with all or part of the design useful load. All airplanes in this category, regardless of weight, shall be placarded against spins or demonstrated to be "characteristically incapable of spinning" in which case they shall be so designated. (See paragraph (d) of this section.)

(b) *Category U.* Airplanes in this category shall comply with either the entire requirements of paragraph (a) of this section or the entire requirements of paragraph (c) of this section.

(c) *Category A.* All airplanes in this category must be capable of spinning and shall comply with the following:

(1) At any permissible combination of weight and center of gravity position obtainable with all or part of the design useful load, the airplane shall recover from a six-turn spin with controls free in not more than four additional turns after releasing the controls. If the airplane will not recover as prescribed with controls free but will recover with the controls assisted to the extent necessary to overcome friction, the airplane may be certificated with the rear-most center of gravity position 2 percent forward of the position used in the test.

(2) It shall be possible to recover at any point in the spinning described above by using the controls in a normal manner for that purpose in not more than one and one-half additional turns, and without exceeding either the limiting air speed or the limit positive maneuvering load factor for the airplane. It shall not be possible to obtain uncontrollable spins by means of any possible use of the controls.

(d) *Category NU.* When it is desired to designate an airplane as a type "characteristically incapable of spinning," the flight tests to demonstrate this characteristic shall also be conducted with:

(1) A maximum weight 5 percent in excess of the weight for which approval is desired,

(2) A center of gravity at least 3 percent aft of the rear-most position for which approval is desired,

(3) An available up-elevator travel 4 degrees in excess of that to which the elevator travel is to be limited by appropriate stops.

(4) An available rudder travel 7 degrees, in both directions, in excess of that to which the rudder travel is to be limited by appropriate stops.

GROUND AND WATER CHARACTERISTICS

§ 3.143 *Requirements.* All airplanes shall comply with the requirements of §§ 3.144 to 3.147.

§ 3.144 *Longitudinal stability and control.* There shall be no uncontrollable tendency for landplanes to nose over in any operating condition reasonably expected for the type, or when rebound occurs during landing or take-off. Wheel brakes shall operate smoothly and shall exhibit no undue tendency to induce nosing over. Seaplanes shall exhibit no dangerous or uncontrollable porpoising at any speed at which the airplane is normally operated on the water.

§ 3.145 *Directional stability and control.* (a) There shall be no uncontrollable looping tendency in 90-degree cross winds up to a velocity equal to $0.2 V_{st}$ at any speed at which the aircraft may be expected to be operated upon the ground or water.

(b) All landplanes shall be demonstrated to be satisfactorily controllable with no exceptional degree of skill or alertness on the part of the pilot in power-off landings at normal landing speed and during which brakes or engine power are not used to maintain a straight path.

(c) Means shall be provided for adequate directional control during taxiing.

§ 3.146 *Shock absorption.* The shock-absorbing mechanism shall not produce damage to the structure when the airplane is taxied on the roughest ground which it is reasonable to expect the airplane to encounter in normal operation.

§ 3.147 *Spray characteristics.* For seaplanes, spray during taxiing, take-off, and landing shall at no time dangerously obscure the vision of the pilots nor produce damage to the propeller or other parts of the airplane.

FLUTTER AND VIBRATION

§ 3.159 *Flutter and vibration.* All parts of the airplane shall be demonstrated to be free from flutter and excessive vibration under all speed and power conditions appropriate to the operation of the airplane up to at least the minimum value permitted for V_A in § 3.184. There shall also be no buffeting condition in any normal flight condition severe enough to interfere with the satisfactory control of the airplane or to cause excessive fatigue to the crew or result in structural damage. However, buffeting as stall warning is considered desirable and discouragement of this type of buffeting is not intended.

SUBPART C—STRENGTH REQUIREMENTS GENERAL

§ 3.171 *Loads.* (a) Strength requirements are specified in terms of limit and ultimate loads. Limit loads are the maximum loads anticipated in service. Ultimate loads are equal to the limit loads multiplied by the factor of safety. Unless otherwise described, loads specified are limit loads.

(b) Unless otherwise provided, the specified air, ground, and water loads shall be placed in equilibrium with inertia forces, considering all items of mass in the airplane. All such loads shall be distributed in a manner conservatively approximating or closely representing actual conditions. If deflections under load would change significantly the distribution of external or internal loads, such redistribution shall be taken into account.

§ 3.172 *Factor of safety.* The factor of safety shall be 1.5 unless otherwise specified.

§ 3.173 *Strength and deformations.* The structure shall be capable of supporting limit loads without suffering detrimental permanent deformations. At all loads up to limit loads, the deformation shall be such as not to interfere with safe operation of the airplane. The structure shall be capable of supporting ultimate loads without failure for at least 3 seconds, except that when proof of strength is demonstrated by dynamic tests simulating actual conditions of load application, the 3-second limit does not apply.

§ 3.173-1 *Dynamic tests (CAA policies which apply to § 3.173).* (a) Section 3.173 permits dynamic testing in lieu of stress analysis or static testing in the proof of compliance of the structure with strength and deformation requirements. In demonstrating, by dynamic tests, proof of strength of landing gears for the stipulated landing conditions contained in §§ 3.245, 3.246, and 3.247, it is necessary to employ a procedure which will not result in the accepting of landing gears weaker than those qualified for acceptance under present procedures, i. e., stress analysis or static testing.

(b) The Administrator will accept, as an adequate procedure for this purpose, the following dynamic tests:

The structure shall be dropped a minimum of 10 times from the limit drop height, and at least one time from the ultimate drop height, for each basic design condition for which proof of strength is being made by drop tests.

(c) With regard to the extent to which the structure can be proved by dynamic tests, such dynamic tests shall be accepted as proof of strength for only those elements of the structure for which it can be shown that the critical limit and ultimate loads have been reproduced.

[12 F. R. 3435. Correction noted at 14 F. R. 36]

§ 3.174 *Proof of structure.* Proof of compliance of the structure with the strength and deformation requirements of § 3.173 shall be made for all critical loading conditions. Proof of compliance by means of structural analysis will be

accepted only when the structure conforms with types for which experience has shown such methods to be reliable. In all other cases substantiating load tests are required. In all cases certain portions of the structure must be subjected to tests as specified in Subpart D.

FLIGHT LOADS

§ 3.181 *General.* Flight load requirements shall be complied with at critical altitudes within the range in which the airplane may be expected to operate and at all weights between the minimum design weight and the maximum design weight, with any practicable distribution of disposable load within prescribed operating limitations stated in § 3.777-3.780.

§ 3.182 *Definition of flight load factor.* The flight load factors specified represent the acceleration component (in terms of the gravitational constant g) normal to the assumed longitudinal axis of the airplane, and equal in magnitude and opposite in direction to the airplane inertia load factor at the center of gravity.

SYMMETRICAL FLIGHT CONDITIONS (FLAPS RETRACTED)

§ 3.183 *General.* The strength requirements shall be met at all combinations of air speed and load factor on and within the boundaries of a pertinent $V-n$ diagram, constructed similarly to the one shown in Figure 3-1, which represents the envelope of the flight loading conditions specified by the maneuvering and gust criteria of §§ 3.185 and 3.187. This diagram will also be used in determining the airplane structural operating limitations as specified in Subpart G.

§ 3.184 *Design air speeds.* The design air speeds shall be chosen by the designer except that they shall not be less than the following values:

$$V_o \text{ (design cruising speed)} \\ = 38 \sqrt{W/S} \text{ (N)} \\ = 42 \sqrt{W/S} \text{ (A)}$$

except that for values of W/S greater than 20, the above numerical multiplying factors shall be decreased linearly with W/S to a value of 33 at $W/S=100$: And further provided, That the required minimum value need be no greater than $0.9 V_h$ actually obtained at sea level.

$$V_d \text{ (design dive speed)} \\ = 1.40 V_c \text{ min (N)} \\ = 1.50 V_c \text{ min (U)} \\ = 1.55 V_c \text{ min (A)}$$

except that for values of W/S greater than 20, the above numerical multiplying factors shall be decreased linearly with W/S to a value of 1.35 at $W/S=100$. ($V_c \text{ min}$ is the required minimum value of design cruising speed specified above.)

$$V_p \text{ (design maneuvering speed)}$$

$$= V_s \sqrt{n} \text{ where:}$$

V_s = a computed stalling speed with flaps fully retracted at the design weight, normally based on the maximum airplane normal force coefficient, C_{NA} .

n = limit maneuvering load factor used in design.

except that the value of V_p need not exceed the value of V_c used in design.

FIG. 3-1—(V-n) DIAGRAM (FLIGHT ENVELOPE)

§ 3.185 *Maneuvering envelope.* The airplane shall be assumed to be subjected to symmetrical maneuvers resulting in the following limit load factors, except where limited by maximum (static) lift coefficients:

(a) The positive maneuvering load factor specified in § 3.186 at all speeds up to V_d .

(b) The negative maneuvering load factor specified in § 3.186 at speed V_c ; and factors varying linearly with speed from the specified value at V_c to 0.0 at V_d for the N category and -1.0 at V_d for the A and U categories.

§ 3.186 *Maneuvering load factors.* (a) The positive limit maneuvering load factors shall not be less than the following values (see Fig. 3-2):

$$n = 2.1 + \frac{24,000}{W + 10,000} \text{ Category N}$$

except that n need not be greater than 3.8 and shall not be less than 2.5. For airplanes certificated as characteristically incapable of spinning, n need not exceed 3.5.

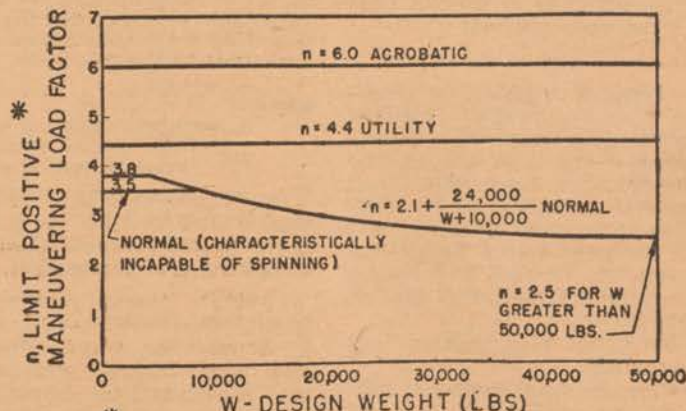

$$n = 4.4 \text{ Category U} \\ n = 6.0 \text{ Category A}$$

(b) The negative limit maneuvering load factors shall not be less than -0.4

times the positive load factor for the N and U categories, and shall not be less than -0.5 times the positive load factor for the A category.

(c) Lower values of maneuvering load factor may be employed only if it be proven that the airplane embodies features of design which make it impossible to exceed such values in flight. (See also § 3.106.)

§ 3.186-1 *Use of reduced maneuvering load factors (CAA policies which apply to § 3.186).* In connection with any application to have an aircraft certified for airworthiness under a combination of the requirements of this part and Part 4a of this chapter as authorized by the provisions of § 3.2, reduced maneuvering load factors may be used, provided it is shown that the basic flight envelope for the airplane meets the requirements of the applicable provisions of this part, and that the related operating limitations found in Subpart G are complied with. The actual analysis may be done on the basis of the requirements contained in Part 4a of this chapter. These requirements specify wing load factors. The net load factor for each condition, n_s , should be determined from the balancing computations. This net load factor shall

* NOTE. LIMIT NEGATIVE MANEUVERING LOAD FACTORS SHALL BE OBTAINED BY MULTIPLYING THE POSITIVE FACTOR VALUES BY .4 FOR NORMAL AND UTILITY CATEGORIES AND BY .5 FOR THE ACROBATIC CATEGORY.

FIG. 3-2—LIMIT MANEUVERING LOAD FACTORS

be equal or greater than the airplane load factor as determined from the Part 3 flight envelope. This analysis procedure may also be used for airplanes certificated entirely under this part.

[12 F. R. 3435. Correction noted at 14 F. R. 36]

§ 3.187 *Gust envelope.* The airplane shall be assumed to encounter symmetrical vertical gusts as specified below while in level flight and the resulting loads shall be considered limit loads:

(a) Positive (up) and negative (down) gusts of 30 feet per second nominal intensity at all speeds up to V_c .

(b) Positive and negative 15 feet per second gusts at V_d . Gust load factors shall be assumed to vary linearly between V_c and V_d .

§ 3.188 *Gust load factors.* In applying the gust requirements, the gust load factors shall be computed by the following formula:

$$n = 1 + \frac{KUVm}{575(W/S)}$$

where: $K = \frac{1}{2}(W/S)^{1/4}$ (for $W/S < 16$ p. s. f.)

$$= 1.33 - \frac{2.67}{(W/S)^{1/4}} \text{ (for } W/S > 16 \text{ p. s. f.)}$$

U —nominal gust velocity, f. p. s.
(Note that the "effective sharp-edged gust" equals KU .)

V —airplane speed, m. p. h.

m —slope of lift curve, C_L per radian, corrected for aspect ratio.

W/S —wing loading, p. s. f.

§ 3.188-1 "Slope of lift curve" (CAA interpretations which apply to § 3.188). For purposes of gust load computations as required in § 3.188 the slope of the lift curve may be assumed equal to that of the wing alone.

[12 F. R. 3435. Correction noted at 14 F. R. 36]

§ 3.189 *Airplane equilibrium.* In determining the wing loads and linear inertia loads corresponding to any of the above specified flight conditions, the appropriate balancing horizontal tail load (see § 3.215) shall be taken into account in a rational or conservative manner.

Incremental horizontal tail loads due to maneuvering and gusts (see §§ 3.216 and 3.217) shall be reacted by angular inertia of the complete airplane in a rational or conservative manner.

FLAPS EXTENDED FLIGHT CONDITIONS

§ 3.190 *Flaps extended flight conditions.* (a) When flaps or similar high lift devices intended for use at the relatively low air speeds of approach, landing, and take-off are installed, the airplane shall be assumed to be subjected to symmetrical maneuvers and gusts with the flaps fully deflected at the design flap speed V_f resulting in limit load factors within the range determined by the following conditions:

(1) Maneuvering, to a positive limit load factor of 2.0.

(2) Positive and negative 15-feet-per-second gusts acting normal to the flight path in level flight. The gust load factors shall be computed by the formula of § 3.188.

V_f shall be assumed not less than 1.4 V_s or 1.8 V_{st} , whichever is greater, where:

V_s —the computed stalling speed with flaps fully retracted at the design weight
 V_{st} —the computed stalling speed with flaps fully extended at the design weight

except that when an automatic flap load limiting device is employed, the airplane may be designed for critical combinations of air speed and flap position permitted by the device. (See also § 3.338.)

(b) In designing the flaps and supporting structure, slipstream effects shall be taken into account as specified in § 3.223.

NOTE: In determining the external loads on the airplane as a whole, the thrust, slipstream, and pitching acceleration may be assumed equal to zero.

UNSYMMETRICAL FLIGHT CONDITIONS

§ 3.191 *Unsymmetrical flight conditions.* The airplane shall be assumed to be subjected to rolling and yawing maneuvers as described in the following conditions. Unbalanced aerodynamic moments about the center of gravity shall be reacted in a rational or conservative manner considering the principal masses furnishing the reacting inertia forces.

(a) *Rolling conditions.* The airplane shall be designed for (1) unsymmetrical wing loads appropriate to the category, and (2) the loads resulting from the aileron deflections and speeds specified in § 3.222, in combination with an airplane load factor of at least two-thirds of the positive maneuvering factor used in the design of the airplane. Only the wing and wing bracing need be investigated for this condition.

NOTE: These conditions may be covered as noted below:

(a) Rolling accelerations may be obtained by modifying the symmetrical flight conditions shown in Figure 3-1 as follows:

(1) *Acrobatic category.* In conditions A and F assume 100 percent of the wing air load acting on one side of the plane of symmetry and 60 percent on the other.

(2) *Normal and utility categories.* In condition A, assume 100 percent of the wing air load acting on one side of the airplane and 70 percent on the other. For airplanes over 1,000 pounds design weight, the latter percentage may be increased linearly with weight up to 80 percent at 25,000 pounds.

(b) The effect of aileron displacement on wing torsion may be accounted for by adding the following increment to the basic airfoil moment coefficient over the aileron portion of the span in the critical condition as determined by the note under § 3.222:

$$\Delta C_m = -.01\delta$$

where:

ΔC_m —moment coefficient increment

δ —down aileron deflection in degrees in critical condition

(b) *Yawing conditions.* The airplane shall be designed for the yawing loads resulting from the vertical surface loads specified in §§ 3.219 to 3.221.

§ 3.191-1 *Aileron rolling conditions* (CAA policies which apply to § 3.191 (a)). In determining whether airplanes of small to medium size and speed comply with § 3.191 (a), the Administrator will accept the following simplified procedure:

(a) *Steady roll.* Determine the C_n value, corresponding to two-thirds of the symmetrical maneuvering load factor. The C_n distribution over the span may

be assumed the same as that for the symmetrical flight conditions. Modify the wing moment coefficient over the aileron portions of the span, as described in the "note" under § 3.191 (a), corresponding to the required aileron deflections. The wing may be critical in torsion on the up as well as the down aileron side, depending upon airfoil section, elastic axis location, aileron differential, etc. (For the up aileron, the moment coefficient increment will be positive.)

(b) *Maximum angular acceleration.* This condition need be investigated only for wings carrying large mass items outboard. In such cases instantaneous aileron deflection (zero rolling velocity) may be assumed and the local value of C_n and C_m over the aileron portions of the span modified accordingly to obtain the spanwise airload distribution. The average C_n of the entire wing should correspond to two-thirds of the symmetrical maneuvering load factor. The resulting rolling moment should be resisted by the rolling inertia of the entire airplane.

[12 F. R. 3435. Correction noted at 14 F. R. 36]

SUPPLEMENTARY CONDITIONS

§ 3.194 *Special condition for rear lift truss.* When a rear lift truss is employed, it shall be designed for conditions of reversed airflow at a design speed of:

$$V = 10\sqrt{W/S} + 10 \text{ (m. p. h.)}$$

NOTE: It may be assumed that the value of C_L is equal to -0.8 and the chordwise distribution is triangular between a peak at the trailing edge and zero at the leading edge.

§ 3.195 *Engine torque effects.* (a) Engine mounts and their supporting structures shall be designed for engine torque effects combined with certain basic flight conditions as described in subparagraphs (1) and (2) of this paragraph. Engine torque may be neglected in the other flight conditions.

(1) The limit torque corresponding to take-off power and propeller speed acting simultaneously with 75 percent of the limit loads from flight condition A. (See Fig. 3-1.)

(2) The limit torque corresponding to maximum continuous power and propeller speed, acting simultaneously with the limit loads from flight condition A. (See Fig. 3-1.)

(b) The limit torque shall be obtained by multiplying the mean torque by a factor of 1.33 in the case of engines having 5 or more cylinders. For 4-, 3-, and 2-cylinder engines, the factors shall be 2, 3, and 4, respectively.

§ 3.196 *Side load on engine mount.* The limit load factor in a lateral direction for this condition shall be at least equal to one-third of the limit load factor for flight condition A (see Fig. 3-1) except that it shall not be less than 1.33. Engine mounts and their supporting structure shall be designed for this condition which may be assumed independent of other flight conditions.

CONTROL SURFACE LOADS

§ 3.211 *General.* The control surface loads specified in the following sections shall be assumed to occur in the

symmetrical and unsymmetrical flight conditions as described in §§ 3.189-3.191. See Figures 3-3 to 3-10 for acceptable values of control surface loadings which are considered as conforming to the following detailed rational requirements.

§ 3.212 *Pilot effort.* In the control surface loading conditions described, the airloads on the movable surfaces and the corresponding deflections need not exceed those which could be obtained in flight by employing the maximum pilot control forces specified in Figure 3-11. In applying this criterion, proper consideration shall be given to the effects of control system boost and servo mechanisms, tabs, and automatic pilot systems in assisting the pilot.

§ 3.212-1 *Automatic pilot systems (CAA policies which apply to § 3.212).* The Administrator will accept the following procedure as giving proper consideration of automatic pilot systems in assisting the pilot under § 3.212: The autopilot effort need not be added to human pilot effort but the autopilot effort shall be used for design if it alone can produce greater control surface loads than the human pilot.

[12 F. R. 3436. Correction noted at 14 F. R. 36]

§ 3.213 *Trim tab effects.* The effects of trim tabs on the control surface design conditions need be taken into account only in cases where the surface loads are limited on the basis of maximum pilot effort. In such cases the tabs shall be considered to be deflected in the direction which would assist the pilot and the deflection shall correspond to the maximum expected degree of "out of trim" at the speed for the condition under consideration.

HORIZONTAL TAIL SURFACES

§ 3.214 *Horizontal tail surfaces.* The horizontal tail surfaces shall be designed for the conditions set forth in §§ 3.215-3.218.

§ 3.215 *Balancing loads.* A horizontal tail balancing load is defined as that necessary to maintain the airplane in equilibrium in a specified flight condition with zero pitching acceleration. The horizontal tail surfaces shall be designed for the balancing loads occurring at any point on the limit maneuvering envelope, Figure 3-1, and in the flap conditions. (See § 3.190.)

NOTE: The distribution of Figure 3-7 may be used.

§ 3.216 *Maneuvering loads.* (a) At maneuvering speed V_p assume a sudden deflection of the elevator control to the maximum upward deflection as limited by the control stops or pilot effort, whichever is critical.

NOTE: The average loading of Figure 3-3 and the distribution of Figure 3-8 may be used. In determining the resultant normal force coefficient for the tail under these conditions, it will be permissible to assume that the angle of attack of the stabilizer with respect to the resultant direction of air flow is equal to that which occurs when the airplane is in steady unaccelerated flight at a flight speed equal to V_p . The maximum elevator deflection can then be determined from the above criteria and the tail normal

Acceptable values of limit average maneuvering control surface loadings can be obtained from Figure 3-3 (b) as follows:

Horizontal Tail Surfaces

- (1) Condition § 3.216 (a): Obtain \bar{w} as function of W/S and surface deflection;
Use Curve C for deflection 10° or less;
Use Curve B for deflection 20°;
Use Curve A for deflection 30° or more;
(Interpolate for other deflections);
Use distribution of Figure 3-8.
- (2) Condition § 3.213 (b): Obtain \bar{w} from Curve B. Use distribution of Figure 3-8.

Vertical Tail Surfaces

- (3) Condition § 3.219 (a): Obtain \bar{w} as function of W/S and surface deflection in same manner as outlined in (1) above, use distribution of Figure 3-8;
- (4) Condition § 3.219 (b): Obtain \bar{w} from Curve C, use distribution of Figure 3-7;
- (5) Condition § 3.219 (c): Obtain \bar{w} from Curve A, use distribution of Figure 3-9. (Note that condition § 3.220 generally will be more critical than this condition.)

Ailerons

- (6) In lieu of conditions § 3.222 (b): Obtain \bar{w} from Curve B, acting in both up and down directions.
Use distribution of Figure 3-10.

FIG. 3-5(b) — UP GUST LOADING ON HORIZONTAL TAIL SURFACE

FIG. 3-6 — GUST LOADING ON VERTICAL TAIL SURFACE

FIG. 3-7 TAIL SURFACE LOAD DISTRIBUTION

FIG. 3-8 TAIL SURFACE LOAD DISTRIBUTION

FIG. 3-9 TAIL SURFACE LOAD DISTRIBUTION

FIG. 3-10 AILERON LOAD DISTRIBUTION

force coefficient can be obtained from the data given in NACA Report No. 688, "Aerodynamic Characteristics of Horizontal Tail Surfaces," or other applicable NACA reports.

(b) Same as case (a) except that the elevator deflection is downward.

NOTE: The average loading of Figure 3-3 and the distribution of Figure 3-8 may be used.

(c) At all speeds above V_p the horizontal tail shall be designed for the maneuvering loads resulting from a sudden upward deflection of the elevator, followed by a downward deflection of the elevator such that the following combinations of normal acceleration and angular acceleration are obtained:

Condition	Airplane normal acceleration n	Angular acceleration radian/sec. ²
Down load.....	1.0	$\frac{45}{V} n_m (n_m - 1.5)$
Up load.....	n_m	$-\frac{45}{V} n_m (n_m - 1.5)$

where:

n_m = positive limit maneuvering load factor used in the design of the airplane.

V = initial speed in miles per hour.

(d) The total tail load for the conditions specified in (c) shall be the sum of: (1) The balancing tail load corresponding with the condition at speed V and the specified value of the normal load factor n , plus (2) the maneuvering load increment due to the specified value of the angular acceleration.

NOTE: The maneuvering load increment of Figure 3-4 and the distributions of Figure 3-8 (for downloads) and Figure 3-9 (for uploads) may be used. These distributions apply to the total tail load.

§ 3.217 *Gust loads.* The horizontal tail surfaces shall be designed for loads occurring in the following conditions:

(a) Positive and negative gusts of 30 feet per second nominal intensity at speed V_c , corresponding to flight condition § 3.187 (a) with flaps retracted.

NOTE: The average loadings of Figures 3-5 (a) and 3-5 (b) and the distribution of Figure 3-9 may be used for the total tail loading in this condition.

(b) Positive and negative gusts of 15 feet per second nominal intensity at speed V_t , corresponding to flight condition § 3.190 (b) with flaps extended. In determining the total load on the horizontal tail for these conditions, the initial balancing tail loads shall first be determined for steady unaccelerated flight at the pertinent design speeds V_c and V_t . The incremental tail load resulting from the gust shall then be added to the initial balancing tail load to obtain the total tail load.

NOTE: The incremental tail load due to the gust may be computed by the following formula:

$$\Delta t = 0.1 KUVS_t a_t \left(1 - \frac{36a_w}{R_w} \right)$$

where:

Δt = the limit gust load increment on the tail in pounds;

K = gust coefficient K in § 3.188,

U = nominal gust intensity in feet per second,

V = airplane speed in miles per hour,
 S_t = tail surface area in square feet,
 a_t = slope of lift curve of tail surface, C_L per degree, corrected for aspect ratio,
 a_w = slope of lift curve of wing, C_L per degree,
 R_w = aspect ratio of the wing.

§ 3.218 *Unsymmetrical loads.* The maximum horizontal tail surface loading (load per unit area), as determined by the preceding sections, shall be applied to the horizontal surfaces on one side of the plane of symmetry and the following percentage of that loading shall be applied on the opposite side:

$\% = 100 - 10(n - 1)$ where:
 n is the specified positive maneuvering load factor.

In any case the above value shall not be greater than 80 percent.

VERTICAL TAIL SURFACES

§ 3.219 *Maneuvering loads.* At all speeds up to V_p :

(a) With the airplane in unaccelerated flight at zero yaw, a sudden displacement of the rudder control to the maximum deflection as limited by the control stops or pilot effort, whichever is critical, shall be assumed.

NOTE: The average loading of Figure 3-3 and the distribution of Figure 3-8 may be used.

(b) The airplane shall be assumed to be yawed to a sideslip angle of 15 degrees while the rudder control is maintained at full deflection (except as limited by pilot effort) in the direction tending to increase the sideslip.

NOTE: The average loading of Figure 3-3 and the distribution of Figure 3-7 may be used.

(c) The airplane shall be assumed to be yawed to a sideslip angle of 15 degrees while the rudder control is maintained in the neutral position (except as limited by pilot effort). The assumed sideslip angles may be reduced if it is shown that the value chosen for a particular speed cannot be exceeded in the cases of steady slips, uncoordinated rolls from a steep bank, and sudden failure of the critical engine with delayed corrective action.

NOTE: The average loading of Figure 3-3 and the distribution of Figure 3-9 may be used.

§ 3.220 *Gust loads.* (a) The airplane shall be assumed to encounter a gust of 30 feet per second nominal intensity, normal to the plane of symmetry while in unaccelerated flight at speed V_c .

(b) The gust loading shall be computed by the following formula:

$$\bar{w} = \frac{KUVm}{575}$$

where:

\bar{w} = average limit unit pressure in pounds per square foot,

$K = 1.33 - \frac{4.5}{(W/S_v)^{1/4}}$, except that K shall

not be less than 1.0. A value of K obtained by rational determination may be used.

U = nominal gust intensity in feet per second,

V = airplane speed in miles per hour,

m = slope of lift curve of vertical surface, C_L per radian, corrected for aspect ratio,

W = design weight in pounds,

S_v = vertical surface area in square feet.

(c) This loading applies only to that portion of the vertical surfaces having a well-defined leading edge.

NOTE: The average loading of Figure 3-6 and the distribution of Figure 3-9 may be used.

§ 3.221 *Outboard fins.* When outboard fins are carried on the horizontal tail surface, the tail surfaces shall be designed for the maximum horizontal surface load in combination with the corresponding loads induced on the vertical surfaces by end plate effects. Such induced effects need not be combined with other vertical surface loads. When outboard fins extend above and below the horizontal surface, the critical vertical surface loading (load per unit area) as determined by §§ 3.219 and 3.220 shall be applied:

(a) To the portion of the vertical surfaces above the horizontal surface, and 80 percent of that loading applied to the portion below the horizontal surface,

(b) To the portion of the vertical surfaces below the horizontal surface, and 80 percent of that loading applied to the portion above the horizontal surface.

AILERONS, WING FLAPS, TABS, ETC.

§ 3.222 *Ailerons.* (a) In the symmetrical flight conditions (see §§ 3.183-3.189), the ailerons shall be designed for all loads to which they are subjected while in the neutral position.

(b) In unsymmetrical flight conditions (see § 3.191 (a)), the ailerons shall be designed for the loads resulting from the following deflections except as limited by pilot effort:

(1) At speed V_p it shall be assumed that there occurs a sudden maximum displacement of the aileron control. (Suitable allowance may be made for control system deflections.)

(2) When V_c is greater than V_p , the aileron deflection at V_c shall be that required to produce a rate of roll not less than that obtained in condition (1).

(3) At speed V_d the aileron deflection shall be that required to produce a rate of roll not less than one-third of that which would be obtained at the speed and aileron deflection specified in condition (1).

NOTE: For conventional ailerons, the deflections for conditions (2) and (3) may be computed from:

$$\delta_1 = \frac{V_p}{V_c} \delta_{11}; \quad \text{and} \quad \delta_2 = \frac{0.5 V_p}{V_d} \delta_{11};$$

where:

δ_1 = total aileron deflection (sum of both aileron deflections) in condition (1).

δ_2 = total aileron deflection in condition (2).

δ_3 = total deflection in condition (3). In the equation for δ_3 , the 0.5 factor is used instead of 0.33 to allow for wing torsional flexibility.

(c) The critical loading on the ailerons should occur in condition (2) if V_d is less than $2V_c$ and the wing meets the torsional stiffness criteria. The normal force coefficient C_N for the ailerons may be taken as 0.048, where δ is the deflec-

tion of the individual aileron in degrees. The critical condition for wing torsional loads will depend upon the basic airfoil moment coefficient as well as the speed, and may be determined as follows:

$$\frac{T_2}{T_1} = \frac{(C_m - .01\delta_{21}) V_d^2}{(C_m - .01\delta_{21}) V_c^2}$$

where:

T_2/T_1 is the ratio of wing torsion in condition (b) (3) to that in condition (b) (2).

δ_{21} and δ_{31} are the down deflections of the individual aileron in conditions (b) (2) and (3) respectively.

(d) When T_2/T_1 is greater than 1.0 condition (b) (3) is critical; when T_2/T_1 is less than 1.0 condition (b) (2) is critical.

(e) In lieu of the above rational conditions the average loading of Figure 3-3 and the distribution of Figure 3-10 may be used.

§ 3.223 Wing flaps. Wing flaps, their operating mechanism, and supporting structure shall be designed for critical loads occurring in the flap-extended flight conditions (see § 3.190) with the flaps extended to any position from fully retracted to fully extended; except that when an automatic flap load limiting device is employed these parts may be designed for critical combinations of air speed and flap position permitted by the device. (Also see §§ 3.338 and 3.339.) The effects of propeller slipstream corresponding to take-off power shall be taken into account at an airplane speed of not less than $1.4 V_s$ where V_s is the computed stalling speed with flaps fully retracted at the design weight. For investigation of the slipstream condition, the airplane load factor may be assumed to be 1.0.

§ 3.224 Tabs. Control surface tabs shall be designed for the most severe combination of air speed and tab deflection likely to be obtained within the limit $V-n$ diagram (Fig. 3-1) for any usable loading condition of the airplane.

§ 3.225 Special devices. The loading for special devices employing aerodynamic surfaces, such as slots and spoilers, shall be based on test data.

CONTROL SYSTEM LOADS

§ 3.231 Primary flight controls and systems. (a) Flight control systems and supporting structures shall be designed for loads corresponding to 125 percent of the computed hinge moments of the movable control surface in the conditions prescribed in §§ 3.211 to 3.225, subject to the following maxima and minima:

(1) The system limit loads need not exceed those which can be produced by the pilot and automatic devices operating the controls.

(2) The loads shall in any case be sufficient to provide a rugged system for service use, including consideration of jamming, ground gusts, taxiing tail to wind, control inertia, and friction.

(b) Acceptable maximum and minimum pilot loads for elevator, aileron, and rudder controls are shown in Figure 3-11. These pilot loads shall be assumed to act at the appropriate control grips or pads in a manner simulating flight con-

ditions and to be reacted at the attachments of the control system to the control surface horn.

§ 3.231-1 Hinge moments (CAA policies which apply to § 3.231). The 125 percent factor on computed hinge moments provided in § 3.231 (a) need be applied only to elevator, aileron and rudder systems. The Administrator will accept a factor as low as 1.0 when hinge moments are based on test data, the exact reduction which the Administrator will accept, depending to an extent upon the accuracy and reliability of the data.

[12 F. R. 3436. Correction noted at 14 F. R. 36]

§ 3.231-2 System limit loads (CAA policies which apply to § 3.231 (a) (1)). The Administrator will accept the following procedure as compliance with § 3.231 (a) (1): When the autopilot is acting in conjunction with the human pilot, the autopilot effort need not be added to human pilot effort but the autopilot effort shall be used for design if it alone can produce greater control surface loads than the human pilot. When the human pilot acts in opposition to the autopilot, that portion of the system between them shall be designed for the maximum effort of human pilot or autopilot, whichever is the lesser.

[12 F. R. 3436. Correction noted at 14 F. R. 36]

§ 3.232 Dual controls. When dual controls are provided, the systems shall be designed for the pilots operating in opposition, using individual pilot loads equal to 75 percent of those obtained in accordance with § 3.231, except that the individual pilot loads shall not be less than the minimum loads specified in Figure 3-11.

§ 3.233 Ground gust conditions. (a) The following ground gust conditions shall be investigated in cases where a deviation from the specific values for minimum control forces listed in Figure 3-11 is applicable. The following conditions are intended to simulate the loadings on control surfaces due to ground gusts and when taxiing with the wind.

(b) The limit hinge moment H shall be obtained from the following formula:

$$H = K_c S q$$

where:

H —limit hinge moment (foot-pounds).

c —mean chord of the control surface aft of the hinge line (feet).

S —area of control surface aft of the hinge line (square feet).

q —dynamic pressure (pounds per square foot) to be based on a design speed

not less than $10\sqrt{W/S} + 10$ miles per hour, except that the design speed need not exceed 60 miles per hour.

K —factor as specified below:

Surface	K
(a) Aileron.....	+0.75
Control column locked or lashed in mid-position.	
(b) Aileron.....	+0.50
Ailerons at full throw; + moment on one aileron, — moment on the other.	
(c) (d) Elevator.....	+0.75
Elevator (c) full up (—), and (d) full down (+).	
(e) (f) Rudder.....	+0.75
Rudder (e) in neutral, and (f) at full throw.	

(c) As used in paragraph (b) in connection with ailerons and elevators, a positive value of K indicates a moment tending to depress the surface while a negative value of K indicates a moment tending to raise the surface.

§ 3.233-1 Ground gust loads (CAA policies which apply to § 3.233). Section 3.233 requires ground gust loads to be investigated when a reduction in minimum pilot effort loads is desired. In such cases the entire system shall be investigated for ground gust loads. However, in instances where the designer desires to investigate ground gust loads without intending to reduce pilot effort loads, the ground gust load need be carried only from the control surface horn to the nearest stops or gust locks, including the stops or locks and their supporting structures.

[12 F. R. 3436. Correction noted at 14 F. R. 36]

§ 3.234 Secondary controls and systems. Secondary controls, such as wheel brakes, spoilers, and tab controls, shall be designed for the loads based on the maximum which a pilot is likely to apply to the control in question.

LIMIT PILOT LOADS

Control	Maximum loads for design weight W equal to or less than 5,000 lbs. ¹	Minimum loads ²
Aileron:		
Stick.....	67 pounds.....	40 pounds.
Wheel ³	53 D in-pounds ⁴	40 D in-pounds.
Elevator:		
Stick.....	167 pounds.....	100 pounds.
Wheel.....	200 pounds.....	100 pounds.
Rudder.....	200 pounds.....	130 pounds.

¹ For design weight W greater than 5,000 pounds the above specified maximum values shall be increased linearly with weight to 1.5 times the specified values at a design weight of 25,000 pounds.

² If the design of any individual set of control systems or surfaces is such as to make these specified minimum loads inapplicable, values corresponding to the pertinent hinge moments obtained according to § 3.233 may be used instead, except that in any case values less than 0.6 of the specified minimum loads shall not be employed.

³ The critical portions of the aileron control system shall also be designed for a single tangential force having a limit value equal to 1.25 times the couple force determined from the above criteria.

⁴ D = wheel diameter.

FIG. 3-11—PILOT CONTROL FORCE LIMITS

GROUND LOADS

§ 3.241 *Ground loads.* The loads specified in the following conditions shall be considered as the external loads and inertia forces which would occur in an airplane structure if it were acting as a rigid body. In each of the ground load conditions specified the external reactions shall be placed in equilibrium with the linear and angular inertia forces in a rational or conservative manner.

§ 3.242 *Design weight.* The design weight used in the landing conditions shall not be less than the maximum weight for which certification is desired: *Provided, however,* That for multiengine airplanes meeting the one-engine-inoperative climb requirement of § 3.85 (b), the airplane may be designed for a design landing weight which is less than the maximum design weight, if compliance is shown with the following sections of Part 4b in lieu of the corresponding requirements of this part: the ground load requirements of § 4b.241, and shock absorption requirements of § 4b.371 and its related sections, the wheel and tire requirements of §§ 4b.391 and 4b.392, and the fuel jettisoning system requirements of § 4b.536.

§ 3.243 *Load factor for landing conditions.* In the following landing conditions the limit vertical inertia load factor at the center of gravity of the airplane shall be chosen by the designer but shall not be less than the value which would be obtained when landing the airplane with a descent velocity, in feet per second, equal to the following value:

$$V = 4.4 (W/S)^{1/4}$$

except that the descent velocity need not exceed 10 feet per second and shall not be less than 7 feet per second. Wing lift not exceeding two-thirds of the weight of the airplane may be assumed to exist throughout the landing impact and may be assumed to act through the airplane center of gravity. When such wing lift is assumed, the ground reaction load factor may be taken equal to the inertia load factor minus the ratio of the assumed wing lift to the airplane weight. (See § 3.354 for requirements concerning the energy absorption tests which determine the limit load factor corresponding to the required limit descent velocities.) In no case, however, shall the inertia load factor used for design purposes be less than 2.67, nor shall the limit ground reaction load factor be less than 2.0, unless it is demonstrated that lower values of limit load factor will not be exceeded in taxiing the airplane over terrain having the maximum degree of roughness to be expected under intended service use at all speeds up to take-off speed.

LANDING CASES AND ATTITUDES

§ 3.244 *Landing cases and attitudes.* For conventional arrangements of main and nose, or main and tail wheels, the airplane shall be assumed to contact the ground at the specified limit vertical velocity in the attitudes described in §§ 3.245-3.247. (See Figs. 3-12 (a) and 3-12 (b) for acceptable landing condi-

tions which are considered to conform with §§ 3.245-3.247.)

§ 3.245 *Level landing—(a) Tail wheel type.* Normal level flight attitude.

(b) *Nose wheel type.* Two cases shall be considered:

(1) Nose and main wheels contacting the ground simultaneously.

(2) Main wheels contacting the ground, nose wheel just clear of the ground. (The angular attitude may be assumed the same as in subparagraph (1) of this paragraph for purposes of analysis.)

(c) *Drag components.* In this condition, drag components simulating the forces required to accelerate the tires and wheels up to the landing speed shall be properly combined with the corresponding instantaneous vertical ground reactions. The wheel spin-up drag loads

may be based on vertical ground reactions, assuming wing lift and a tire-sliding coefficient of friction of 0.8, but in any case the drag loads shall not be less than 25 percent of the maximum vertical ground reactions neglecting wing lift.

§ 3.245-1 *Wheel spin-up loads (CAA policies which apply to § 3.245).* (a) Section 3.245 requires that spin-up loads be taken into account in structural designs. Section 3.244 permits the use of arbitrary drag loads for this purpose.

(b) If it is desired to use a method more rational than the arbitrary drag components referred to in § 3.244 in determining the wheel spin-up loads for landing conditions, the Administrator will accept the following method from NACA T. N. 863 for this purpose (however, the minimum drag component of

Condition	Tail wheel type		Nose wheel type		
	Level landing	Tail-down landing	Level landing with inclined reactions	Level landing with nose wheel just clear of ground	Tail-down landing
Reference section	§ 3.245 (a)	§ 3.246 (a)	§ 3.245 (b) (1)	§ 3.245 (b) (2)	§ 3.246 (b) (c)
Vertical component at c. g.	nW	nW	nW	nW	nW
Fore and aft component at c. g.	KnW	0	KnW	KnW	0
Lateral component in either direction at c. g.	0	0	0	0	0
Shock absorber extension (hydraulic shock absorber)	Note (2)	Note (2)	Note (2)	Note (2)	Note (2)
Shock absorber deflection (rubber or spring shock absorber)	100% Static	100% Static	100% Static	100% Static	100% Static
Tire deflection	nW	nW	nW	nW	nW
Main wheel loads (both wheels)	$\frac{V}{D}$ KV	nW b/d	nW b'/d' KV	nW b'/d' KV	0
Tail (nose) wheel loads	$\frac{V}{D}$ KV	nW a/d	nW a'/d' KV	0	0
Notes	(1) and (2)		(1)	(1) and (2)	(3)

NOTE (1).— K may be determined as follows: $K=0.25$ for $W=3,000$ pounds or less; $K=0.33$ for $W=6,000$ pounds or greater, with linear variation of K between these weights.

NOTE (2).—For the purpose of design, the maximum load factor shall be assumed to occur throughout the shock absorber stroke from 25 percent deflection to 100 percent deflection unless demonstrated otherwise, and the load factor shall be used with whatever shock absorber extension is most critical for each element of the landing gear.

NOTE (3).—Unbalanced moments shall be balanced by a rational or conservative method.

FIG. 3-12(a)—BASIC LANDING CONDITIONS

FIG. 3-12(b)
BASIC LANDING CONDITIONS

0.25 times the vertical component will still apply):

$$F_{H_{\max}} = \frac{1}{r_e} \sqrt{\frac{2I_w(V_H - V_c)nF_{V_{\max}}}{t_z}}$$

where:

$F_{H_{\max}}$ = maximum rearward horizontal force acting on the wheel-pounds.

r_e = effective rolling radius of wheel under impact-feet based on recommended operating tire pressure (may be assumed equal to the rolling radius under a static load of $n_s W_e$).

I_w = rotational mass moment of inertia of rolling assembly slug feet required.

V_H = linear velocity of airplane parallel to ground at instant of contact, assumed $1.2 V_{s_0}$, in feet per second.

V_c = peripheral speed of tire if pre-rotation is used (feet per second)—a positive means of pre-rotation should be provided before pre-rotation can be considered.

n = effective coefficient of friction; 0.80 is acceptable.

$F_{V_{\max}}$ = maximum vertical force on wheel (pounds) = $n_s W_e$, where W_e and n_s are defined in §§ 3.353 and 3.354.

t_z = time interval between ground contact and attainment of maximum vertical force on wheel (seconds). If the value of $F_{H_{\max}}$ from the above equation exceeds $0.8 F_{V_{\max}}$, the latter value should be used $F_{H_{\max}}$.

NOTE: This equation assumes a linear variation of load factor with time until the peak load is reached and under this assumption determines the drag force at the time that the wheel peripheral velocity at radius r_e equals the airplane velocity. Most shock absorbers do not exactly follow a linear variation of load factor with time. Hence, rational or conservative allowances should be made to compensate for these variations. On most landing gears the time for wheel spin-up will be less than the time required to develop maximum vertical load factor for the specified rate of descent and forward velocity. However, for exceptionally large wheels, a wheel peripheral velocity equal to the ground speed may not have been attained at time of maximum vertical gear load. This case is covered by the statement above that the drag spin-up load need not exceed 0.8 of the maximum vertical load.

(b) Dynamic spring-back of the landing gear and adjacent structure at the instant just after the wheels come up to speed may result in dynamic forward acting loads of considerable magnitude. This effect may be simulated in the level landing condition by assuming that the wheel spin-up loads are reversed. Dynamic spring-back is likely to be critical only for landing gear units having wheels of large mass supported by relatively flexible cantilever struts.

(c) The arbitrary drag loads referred to in § 3.244 (Fig. 3-12) are usually sufficient to provide for wheel spin-up except for airplanes having large diameter wheels or high stalling speeds. For the latter, it is recommended that a more rational investigation, such as that described above, be made.

[12 F. R. 3436. Correction noted at 14 F. R. 36]

§ 3.246 Tail down—(a) Tail wheel type. Main and tail wheels contacting ground simultaneously.

(b) Nose wheel type. Stalling attitude or the maximum angle permitting clearance of the ground by all parts of the airplane, whichever is the lesser.

(c) Vertical ground reactions. In this condition, it shall be assumed that the ground reactions are vertical, the wheels having been brought up to speed before the maximum vertical load is attained.

§ 3.247 One-wheel landing. One side of the main gear shall contact the ground with the airplane in the level attitude. The ground reactions shall be the same as those obtained on the one side in the level attitude. (See § 3.245.)

GROUND ROLL CONDITIONS

§ 3.248 Braked roll. The limit vertical load factor shall be 1.33. The attitude and ground contacts shall be those described for level landings in § 3.245, with the shock absorbers and tires deflected to their static positions. A drag reaction equal to the vertical reaction at the wheel multiplied by a coefficient of friction of 0.8 shall be applied at the ground contact point of each wheel having brakes, except that the drag reaction need not exceed the maximum value based on limiting brake torque.

§ 3.249 Side load. Level attitude with main wheels only contacting the ground, with the shock absorbers and tires deflected to their static positions. The limit vertical load factor shall be 1.33 with the vertical ground reaction divided equally between main wheels. The limit side inertia factor shall be 0.83 with the side ground reaction divided between main wheels as follows:

0.5W acting inboard on one side.
0.33W acting outboard on the other side.

TAIL WHEELS

§ 3.250 Supplementary conditions for tail wheels. The conditions in §§ 3.251 and 3.252 apply to tail wheels and affected supporting structure.

§ 3.251 Obstruction load. The limit ground reaction obtained in the tail down landing condition shall be assumed to act up and aft through the axle at 45 degrees. The shock absorber and tire may be assumed deflected to their static positions.

§ 3.252 Side load. A limit vertical ground reaction equal to the static load on the tail wheel, in combination with a side component of equal magnitude. When a swivel is provided, the tail wheel shall be assumed swiveled 90 degrees to the airplane longitudinal axis, the resultant ground load passing through the axle. When a lock steering device or shimmy damper is provided, the tail wheel shall also be assumed in the trailing position with the side load acting at the ground contact point. The shock absorber and tire shall be assumed deflected to their static positions.

NOSE WHEELS

§ 3.253 Supplementary conditions for nose wheels. The conditions set forth in §§ 3.254–3.256 apply to nose wheels and affected supporting structure. The shock absorbers and tires shall be assumed deflected to their static positions.

§ 3.254 Aft load. Limit force components at axle:

Vertical, 2.25 times static load on wheel,
Drag, 0.8 times vertical load.

§ 3.255 Forward load. Limit force components at axle:

Vertical, 2.25 times static load on wheel,
Forward, 0.4 times vertical load.

§ 3.256 Side load. Limit force components at ground contact:

Vertical, 2.25 times static load on wheel,
Side, 0.7 times vertical load.

SKIPLANES

§ 3.257 Supplementary conditions for skiplanes. The airplane shall be assumed resting on the ground with one main ski frozen in the snow and the other main ski and the tail ski free to slide. A limit side force equal to $P/3$ shall be applied at the most convenient point near the tail assembly, where P is the static ground reaction on the tail ski. For this condition the factor of safety shall be assumed equal to 1.0.

WATER LOADS

§ 3.265 General. The requirements set forth in §§ 3.266–3.282 shall apply to the entire airplane, but have particular reference to hull structure, wing, nacelles, and float supporting structure.

DESIGN WEIGHT

§ 3.266 Design weight. The design weight used in the water landing conditions shall not be less than the maximum weight for which certification is desired for any operation.

BOAT SEAPLANES

§ 3.267 Local bottom pressures—(a) Maximum local pressure. The maximum value of the limit local pressure shall be determined from the following equation:

$$P_{\max} = 0.055 V_{s_0}^{1.4} \left(1 + \frac{W}{50,000}\right)^{1/4}$$

where

P = pressure in pound per square inch.
 V_{s_0} = stalling speed, flaps down, power off, in miles per hour (to be calculated on the basis of wind tunnel data or flight tests on previous airplanes).
 W = design weight.

(b) Variation in local pressure. The local pressures to be applied to the hull bottom shall vary in accordance with Figure 3-13. No variation from keel to chine (beamwise) shall be assumed, except when the chine flare indicates the advisability of higher pressures at the chine.

(c) Application of local pressure. The local pressures determined in paragraphs (a) and (b) of this section shall be applied over a local area in such a manner as to cause the maximum local loads in the hull bottom structure.

§ 3.268 Distributed bottom pressures. (a) For the purpose of designing frames, keels, and chine structure, the limit pressures obtained from § 3.267 and Figure 3-13 shall be reduced to one-half the local values and simultaneously applied over the entire hull bottom. The loads so obtained shall be carried into the side-wall structure of the hull proper, but need not be transmitted in a fore-and-aft direction as shear and bending loads.

FIG. 3-13 DISTRIBUTION OF LOCAL PRESSURES
(BOAT SEAPLANES)

(b) *Unsymmetrical loading.* Each floor member or frame shall be designed for a load on one side of the hull center line equal to the most critical symmetrical loading, combined with a load on the other side of the hull center line equal to one-half of the most critical symmetrical loading.

§ 3.269 *Step loading condition—(a) Application of load.* The resultant water load shall be applied vertically in the plane of symmetry so as to pass through the center of gravity of the airplane.

(b) *Acceleration.* The limit acceleration shall be 4.33.

(c) *Hull shear and bending loads.* The hull shear and bending loads shall be computed from the inertia loads produced by the vertical water load. To avoid excessive local shear loads and bending moments near the point of water load application, the water load may be distributed over the hull bottom, using pressures not less than those specified in § 3.268.

§ 3.270 *Bow loading condition—(a) Application of load.* The resultant water load shall be applied in the plane of symmetry at a point one-tenth of the distance from the bow to the step and shall be directed upward and rearward at an angle of 30 degrees from the vertical.

(b) *Magnitude of load.* The magnitude of the limit resultant water load shall be determined from the following equation:

$$P_b = \frac{n_s W_e}{2}$$

where:

P_b = the load in pounds.

n_s = the step landing load factor.

W_e = an effective weight which is assumed equal to one-half the design weight of the airplane.

(c) *Hull shear and bending loads.* The hull shear and bending loads shall be determined by proper consideration of the inertia loads which resist the linear and angular accelerations involved. To avoid excessive local shear loads, the

water reaction may be distributed over the hull bottom, using pressures not less than those specified in § 3.268.

§ 3.271 *Stern loading condition—(a) Application of load.* The resultant water load shall be applied vertically in the plane of symmetry and shall be distributed over the hull bottom from the second step forward with an intensity equal to the pressures specified in §§ 3.267–3.272.

(b) *Magnitude of load.* The limit resultant load shall equal three-fourths of the maximum design weight of the airplane.

(c) *Hull shear and bending loads.* The hull shear and bending loads shall be determined by assuming the hull structure to be supported at the wing attachment fittings and neglecting internal inertia loads. This condition need not be applied to the fittings or to the portion of the hull ahead of the rear attachment fittings.

§ 3.272 *Side loading condition—(a) Application of load.* The resultant water load shall be applied in a vertical plane through the center of gravity. The vertical component shall be assumed to act in the plane of symmetry and horizontal component at a point halfway between the bottom of the keel and the load water line at design weight (at rest).

(b) *Magnitude of load.* The limit vertical component of acceleration shall be 3.25 and the side component shall be equal to 15 percent of the vertical component.

(c) *Hull shear and bending loads.* The hull shear and bending loads shall be determined by proper consideration of the inertia loads or by introducing couples at the wing attachment points. To avoid excessive local shear loads, the water reaction may be distributed over the hull bottom, using pressures not less than those specified by § 3.268.

FLOAT SEAPLANES

§ 3.273 *Landing with inclined reactions.* (a) The vertical component of the limit load factor shall be 4.2 except

that it need not exceed a value given by the following formula:

$$n = 3.0 + 0.133 W/S$$

(b) The propeller axis (or equivalent reference line) shall be assumed to be horizontal and the resultant water reaction to be acting in the plane of symmetry and passing through the center of gravity of the airplane, but inclined so that its horizontal component is equal to one-fourth of its vertical component. Inertia forces shall be assumed to act in a direction parallel to the water reaction.

(c) *Factors of safety.* For the design of float attachment members, including the members necessary to complete a rigid brace truss through the fuselage, the factor of safety shall be 1.85. For the remaining structural members, the factor of safety shall be 1.5.

§ 3.275 *Landing with vertical reactions.* (a) The limit load factor shall be 4.33 acting vertically, except that it need not exceed a value given by the following formula:

$$n = 3.0 + 0.133 W/S$$

(b) The propeller axis (or equivalent reference line) shall be assumed to be horizontal, and the resultant water reaction to be vertical and passing through the center of gravity of the airplane.

(c) *Factors of safety.* The factors of safety shall be the same as those specified in § 3.273 (c).

§ 3.277 *Landing with side load.* The vertical component of the limit load factor shall be 4.0. The propeller axis (or equivalent reference line) shall be assumed to be horizontal and the resultant water reaction shall be assumed to be in the vertical plane which passes through the center of gravity of the airplane and is perpendicular to the propeller axis. The vertical load shall be applied through the keel or keels of the float or floats and evenly divided between the floats when twin floats are used. A side load equal to one-fourth of the vertical load shall be applied along a line approximately halfway between the bottom of the keel and the level of the water line at rest. When twin floats are used, the entire side load specified shall be applied to the float on the side from which the water reaction originates.

§ 3.278 *Supplementary load conditions.* Each main float of a float seaplane shall be capable of carrying the following loads when supported at the attachment fittings as installed on the airplane:

(a) A limit load, acting upward, applied at the bow end of float and of magnitude equal to that portion of the airplane weight normally supported by the particular float.

(b) A limit load, acting upward, applied at the stern of magnitude equal to 0.8 times that portion of the airplane weight normally supported by the particular float.

(c) A limit load, acting upward, applied at the step and of magnitude equal to 1.5 times that portion of the airplane weight normally supported by the particular float.

§ 3.279 *Bottom loads.* (a) Main sea-plane float bottoms shall be designed to withstand the following local pressures:

(1) A limit pressure of at least 10 pounds per square inch over that portion of the bottom lying between the first step and a section 25 percent of the distance from the step to the bow.

(2) A limit pressure of at least 5 pounds per square inch over that portion of the bottom lying between the section 25 percent of the distance from the step to the bow and a section 75 percent of the distance from the step to the bow.

(3) A limit pressure of at least 3 pounds per square inch over that portion of the bottom aft of the step (aft of main step if more than one step is used).

(b) The local pressures determined in paragraph (a) (1), (2) and (3) of this section shall be applied over local areas in such a manner as to cause the maximum loads in local structure such as bottom plating and stringers.

(c) For the purpose of designing frames, keels, and chine structure, distributed bottom pressures equal to one-half of the local values specified above shall be applied over the entire specified bottom areas.

WING-TIP FLOAT AND SEA WING LOADS

§ 3.280 *Wing-tip float loads.* Wing-tip floats and their attachment, including the wing structure, shall be analyzed for each of the following conditions:

(a) A limit load acting vertically up at the completely submerged center of buoyancy and equal to 3 times the completely submerged displacement.

(b) A limit load inclined upward at 45 degrees to the rear and acting through the completely submerged center of buoyancy and equal to 3 times the completely submerged displacement.

(c) A limit load acting parallel to the water surface (laterally) applied at the center of area of the side view and equal to 1.5 times the completely submerged displacement.

§ 3.281 *Wing structure.* The primary wing structure shall incorporate sufficient extra strength to insure that failure of wing-tip float attachment members occurs before the wing structure is damaged.

§ 3.282 *Sea wing loads.* Sea wing design loads shall be based on suitable test data.

SUBPART D—DESIGN AND CONSTRUCTION GENERAL

§ 3.291 *General.* The suitability of all questionable design details or parts having an important bearing on safety in operation shall be established by tests.

§ 3.292 *Materials and workmanship.* The suitability and durability of all materials used in the airplane structure shall be established on the basis of experience or tests. All materials used in the airplane structure shall conform to approved specifications which will insure their having the strength and other properties assumed in the design data. All workmanship shall be of a high standard.

§ 3.293 *Fabrication methods.* The methods of fabrication employed in con-

structing the airplane structure shall be such as to produce consistently sound structure. When a fabrication process such as gluing, spot welding, or heat-treating requires close control to attain this objective, the process shall be performed in accordance with an approved process specification.

§ 3.294 *Standard fastenings.* All bolts, pins, screws, and rivets used in the structure shall be of an approved type. The use of an approved locking device or method is required for all such bolts, pins, and screws. Self-locking nuts shall not be used on bolts subject to rotation during the operation of the airplane.

§ 3.295 *Protection.* All members of the structure shall be suitably protected against deterioration or loss of strength in service due to weathering, corrosion, abrasion, or other causes. In seaplanes, special precaution shall be taken against corrosion from salt water, particularly where parts made from different metals are in close proximity. Adequate provisions for ventilation and drainage of all parts of the structure shall be made.

§ 3.296 *Inspection provisions.* Adequate means shall be provided to permit the close examination of such parts of the airplane as require periodic inspection, adjustments for proper alignment and functioning, and lubrication of moving parts.

STRUCTURAL PARTS

§ 3.301 *Material strength properties and design values.* Material strength properties shall be based on a sufficient number of tests of material conforming to specifications to establish design values on a statistical basis. The design values shall be so chosen that the probability of any structure being under-strength because of material variations is extremely remote. Values contained in ANC-5 and ANC-18 shall be used unless shown to be inapplicable in a particular case.

NOTE: ANC-5, "Strength of Aircraft Elements" and ANC-18, "Design of Wood Aircraft Structures" are published by the Army-Navy-Civil Committee on Aircraft Design Criteria and may be obtained from the Government Printing Office, Washington 25, D. C.

§ 3.301-1 *Design properties* (CAA policies which apply to § 3.301). (a) With reference to section 5.00 of ANC-5, Amendment No. 1, allowable design property columns headed "Army-Navy" represent design properties which will be equalled or exceeded by the properties possessed by approximately 90 percent of the material. All other allowable design property columns relate to the minimum guaranteed properties and are based on values given in the various material specifications. The Administrator will permit uses of these design properties as outlined in subparagraphs (1) and (2) of this section, based on the objectives of § 3.301.

(1) In the case of structures where the applied loads are eventually distributed through single members within an assembly, the failure of which would result in the loss of the structural integrity of the component involved, the guaranteed minimum design mechanical properties listed in ANC-5 shall be used.

NOTE: Typical examples of such items are:

1. Wing lift struts.
2. Spars in two-spar wings.
3. Sparcaps in regions such as wing cut-outs and wing center sections where loads are transmitted through caps only.
4. Primary attachment fittings dependent on single bolts for load transfer.

(2) Redundant structures wherein partial failure of individual elements would result in the applied load being safely distributed to other load carrying members, may be designed on the basis of the "90 percent probability" allowable.

NOTE: Typical examples of such items are:

1. Sheet-stiffener combinations.
2. Multi-rivet or multiple bolt connections.

(b) Certain manufacturers have indicated a desire to use design value greater than the guaranteed minimums even in applications where only guaranteed minimum values would be permitted under paragraph (a) of this section, and have advocated that such allowables be based on "premium selection" of the material. Such increased design allowables will be acceptable to the Administrator: *Provided*, That a specimen or specimens of each individual item are tested prior to its use, to determine that the actual strength properties of that particular item will equal or exceed the properties used in design. This, in effect, results in the airplane or materials manufacturer guaranteeing higher minimum properties than those given in the basic procurement specifications.

(c) When strength testing is employed to establish design allowables (such as in the case of sheet-stiffener compression tests), the test results shall be reduced to values which would be met by material having the design allowable material properties for the part under consideration, as covered in subparagraphs (1) and (2) of this section.

NOTE: Sections 1.543 and 1.544 of ANC-5 outline two means of accomplishing this, but are by no means considered as the only methods available.

[12 F. R. 3436. Correction noted at 14 F. R. 36]

§ 3.302 *Special factors.* Where there may be uncertainty concerning the actual strength of particular parts of the structure or where the strength is likely to deteriorate in service prior to normal replacement, increased factors of safety shall be provided to insure that the reliability of such parts is not less than the rest of the structure as specified in §§ 3.303-3.306.

§ 3.303 *Variability factor.* For parts whose strength is subject to appreciable variability due to uncertainties in manufacturing processes and inspection methods, the factor of safety shall be increased sufficiently to make the probability of any part being under-strength from this cause extremely remote. Minimum variability factors (only the highest pertinent variability factor need be considered) are set forth in §§ 3.304-3.306.

§ 3.304 *Castings.* (a) Where visual inspection only is to be employed, the variability factor shall be 2.0.

(b) The variability factor may be reduced to 1.25 for ultimate loads and

1.15 for limit loads when at least three sample castings are tested to show compliance with these factors, and all sample and production castings are visually and radiographically inspected in accordance with an approved inspection specification.

(c) Other inspection procedures and variability factors may be used if found satisfactory by the Administrator.

§ 3.304-1 *Casting factors (CAA policies which apply to § 3.304)*. With reference to paragraphs (b) and (c) of § 3.304, the Administrator has approved specific proposals which permit the use of lower casting factors as specified in (b), with 100 percent radiographic inspection on initial runs, but with radiographic inspection gradually reduced on production lots as it becomes evident that adequate quality control has been established. All such procedures require the submittal and execution of a satisfactory process specification and statistical proof that adequate quality control has been achieved.

[12 F. R. 3437. Correction noted at 14 F. R. 36]

§ 3.305 *Bearing factors*. (a) The factor of safety in bearing at bolted or pinned joints shall be suitably increased to provide for the following conditions:

(1) Relative motion in operation (control surface and system joints are covered in §§ 3.327-3.347).

(2) Joints with clearance (free fit) subject to pounding or vibration.

(b) Bearing factors need not be applied when covered by other special factors.

§ 3.306 *Fitting factor*. Fittings are defined as parts such as end terminals used to join one structural member to another. A multiplying factor of safety of at least 1.15 shall be used in the analysis of all fittings the strength of which is not proved by limit and ultimate load tests in which the actual stress conditions are simulated in the fitting and the surrounding structure. This factor applies to all portions of the fitting, the means of attachment, and bearing on the members joined. In the case of integral fittings, the part shall be treated as a fitting up to the point where the section properties become typical of the member. The fitting factor need not be applied where a type of joint design based on comprehensive test data is used. The following are examples: continuous joints in metal plating, welded joints, and scarf joints in wood, all made in accordance with approved practices.

§ 3.307 *Fatigue strength*. The structure shall be designed, insofar as practicable, to avoid points of stress concentration where variable stresses above the fatigue limit are likely to occur in normal service.

FLUTTER AND VIBRATION

§ 3.311 *Flutter and vibration prevention measures*. Wings, tail, and control surfaces shall be free from flutter, airfoil divergence, and control reversal from lack of rigidity, for all conditions of operation within the limit $V-n$ envelope, and the following detail requirements shall apply:

No. 136—12

(a) Adequate wing torsional rigidity shall be demonstrated by tests or other methods found suitable by the Administrator.

(b) The mass balance of surfaces shall be such as to preclude flutter.

(c) The natural frequencies of all main structural components shall be determined by vibration tests or other methods found satisfactory by the Administrator.

WINGS

§ 3.317 *Proof of strength*. The strength of stressed-skin wings shall be substantiated by load tests or by combined structural analysis and tests.

§ 3.318 *Ribs*. (a) The strength of ribs in other than stressed-skin wings shall be proved by test to at least 125 percent of the ultimate loads for the most severe loading conditions, unless a rational load analysis and test procedure is employed and the tests cover the variability of the particular type of construction.

(b) The effects of ailerons and high lift devices shall be properly accounted for. Rib tests shall simulate conditions in the airplane with respect to torsional rigidity of spars, fixity conditions, lateral support, and attachment to spars.

§ 3.318-1 *Rib tests (CAA policies which apply to § 3.318)*. Section 3.318 was drafted so as to allow the proof of strength of ribs in stressed skin wings to be made as part of 100-percent ultimate load test of the wings, in cases where the complete wing is tested in such a manner as to simulate the actual air load distribution. In such cases the Administrator will not require that separate rib tests be made. When ribs of stressed skin wings are tested separately from the wing and a rational load distribution is made, a suitable variability factor (see § 3.303) shall be employed in determining the test loads. Although no specific value is stated in § 3.303, a factor of 1.15 is considered acceptable. However, consideration may be given to a lower factor if such lower factor were substantiated by tests on a large number of ribs.

[12 F. R. 3437. Correction noted at 14 F. R. 36]

§ 3.319 *External bracing*. When wires are used for external lift bracing they shall be double unless the design provides for a lift-wire-cut condition. Rigging loads shall be taken into account in a rational or conservative manner. The end connections of brace wires shall be such as to minimize restraint against bending or vibration. When brace struts of large fineness ratio are used, the aerodynamic forces on such struts shall be taken into account.

§ 3.320 *Covering*. Strength tests of fabric covering shall be required unless approved grades of cloth, methods of support, attachment, and finishing are employed. Special tests shall be required when it appears necessary to account for the effects of unusually high design air speeds, slipstream velocities, or other unusual conditions.

§ 3.320-1 *Aircraft fabric (CAA rules which apply to § 3.320)*. See §§ 4b.302-1 and 4b.302-2 of this chapter.

[13 F. R. 7723]

CONTROL SURFACES (FIXED AND MOVABLE)

§ 3.327 *Proof of strength*. Limit load tests of control surfaces are required. Such tests shall include the horn or fitting to which the control system is attached. In structural analyses, rigging loads due to wire bracing shall be taken into account in a rational or conservative manner.

§ 3.328 *Installation*. Movable tail surfaces shall be so installed that there is no interference between the surfaces or their bracing when each is held in its extreme position and all others are operated through their full angular movement. When an adjustable stabilizer is used, stops shall be provided which, in the event of failure of the adjusting mechanism, will limit its travel to a range permitting safe flight and landing.

§ 3.329 *Hinges*. Control surface hinges, excepting ball and roller bearings, shall incorporate a multiplying factor of safety of not less than 6.67 with respect to the ultimate bearing strength of the softest material used as a bearing. For hinges incorporating ball or roller bearings, the approved rating of the bearing shall not be exceeded. Hinges shall provide sufficient strength and rigidity for loads parallel to the hinge line.

CONTROL SYSTEMS

§ 3.335 *General*. All controls shall operate with sufficient ease, smoothness, and positiveness to permit the proper performance of their function and shall be so arranged and identified as to provide convenience in operation and prevent the possibility of confusion and subsequent inadvertent operation. (See § 3.384 for cockpit controls.)

§ 3.336 *Primary flight controls*. (a) Primary flight controls are defined as those used by the pilot for the immediate control of the pitching, rolling, and yawing of the airplane.

(b) For two-control airplanes the design shall be such as to minimize the likelihood of complete loss of the lateral directional control in the event of failure of any connecting or transmitting element in the control system.

§ 3.337 *Trimming controls*. Proper precautions shall be taken against the possibility of inadvertent, improper, or abrupt tab operations. Means shall be provided to indicate to the pilot the direction of control movement relative to airplane motion and the position of the trim device with respect to the range of adjustment. The means used to indicate the direction of the control movement shall be adjacent to the control, and the means used to indicate the position of the trim device shall be easily visible to the pilot and so located and operated as to preclude the possibility of confusion. Trimming devices shall be capable of continued normal operation notwithstanding the failure of any one connecting or transmitting element in the primary flight control system. Tab controls shall be irreversible unless the tab is properly balanced and possesses no unsafe flutter characteristics. Irreversible tab systems shall provide adequate

rigidity and reliability in the portion of the system from the tab to the attachment of the irreversible unit to the airplane structure.

§ 3.338 *Wing flap controls.* The controls shall be such that when the flap has been placed in any position upon which compliance with the performance requirements is based, the flap will not move from that position except upon further adjustment of the control or the automatic operation of a flap load limiting device. Means shall be provided to indicate the flap position to the pilot. If any flap position other than fully retracted or extended is used to show compliance with the performance requirements, such means shall indicate each such position. The rate of movement of the flaps in response to the operation of the pilot's control, or of an automatic device shall not be such as to result in unsatisfactory flight or performance characteristics under steady or changing conditions of air speed, engine power, and airplane attitude. (See § 3.109 (b) and (c).)

§ 3.339 *Flap interconnection.* (a) The motion of flaps on opposite sides of the plane of symmetry shall be synchronized by a mechanical interconnection, unless the airplane is demonstrated to have safe flight characteristics while the flaps are retracted on one side and extended on the other.

(b) Where an interconnection is used, in the case of multiengine airplanes, it shall be designed to account for the unsymmetrical loads resulting from flight with the engines on one side of the plane of symmetry inoperative and the remaining engines at take-off power. For single-engine airplanes, it may be assumed that 100 percent of the critical air load acts on one side and 70 percent on the other.

§ 3.340 *Stops.* All control systems shall be provided with stops which positively limit the range of motion of the control surfaces. Stops shall be so located in the system that wear, slackness, or take-up adjustments will not appreciably affect the range of surface travel. Stops shall be capable of withstanding the loads corresponding to the design conditions for the control system.

§ 3.341 *Control system locks.* When a device is provided for locking a control surface while the airplane is on the ground or water:

(a) The locking device shall be so installed as to provide unmistakable warning to the pilot when it is engaged, and

(b) Means shall be provided to preclude the possibility of the lock becoming engaged during flight.

§ 3.342 *Proof of strength.* Tests shall be conducted to prove compliance with limit load requirements. The direction of test loads shall be such as to produce the most severe loading of the control system structure. The tests shall include all fittings, pulleys, and brackets used to attach the control system to the primary structure. Analyses or individual load tests shall be conducted to demonstrate compliance with the multiplying factor of safety require-

ments specified for control system joints subjected to angular motion.

§ 3.343 *Operation test.* An operation test shall be conducted by operating the controls from the pilot compartment with the entire system so loaded as to correspond to the limit air loads on the surface. In this test there shall be no jamming, excessive friction, or excessive deflection.

CONTROL SYSTEM DETAILS

§ 3.344 *General.* All control systems and operating devices shall be so designed and installed as to prevent jamming, chafing, or interference as a result of inadequate clearances or from cargo, passengers, or loose objects. Special precautions shall be provided in the cockpit to prevent the entry of foreign objects into places where they might jam the controls. Provisions shall be made to prevent the slapping of cables or tubes against parts of the airplane.

§ 3.345 *Cable systems.* Cables, cable fittings, turnbuckles, splices, and pulleys shall be in accordance with approved specifications. Cables smaller than $\frac{1}{8}$ -inch diameter shall not be used in primary control systems. The design of cable systems shall be such that there will not be hazardous change in cable tension throughout the range of travel under operating conditions and temperature variations. Pulley types and sizes shall correspond to the cables with which they are used, as specified on the pulley specification. All pulleys shall be provided with satisfactory guards which shall be closely fitted to prevent the cables becoming misplaced or fouling, even when slack. The pulleys shall lie in the plane passing through the cable within such limits that the cable does not rub against the pulley flange. Fairleads shall be so installed that they are not required to cause a change in cable direction of more than 3 degrees. Clevis pins (excluding those not subject to load or motion) retained only by cotter pins shall not be employed in the control system. Turnbuckles shall be attached to parts having angular motion in such a manner as to prevent positively binding throughout the range of travel. Provisions for visual inspection shall be made at all fairleads, pulleys, terminals, and turnbuckles.

§ 3.345-1 *Cables in primary control systems (CAA interpretations which apply to § 3.345).* Section 3.345 provides that "cables smaller than $\frac{1}{8}$ -inch diameter shall not be used in primary control systems." Primary control systems are normally considered to be the aileron, rudder, and elevator control systems. Hence this minimum of $\frac{1}{8}$ inch need not be applied to tab control cables having high strength margins. However, in cases where the airplane would not be safely controllable in flight and landing with tabs in the most adverse positions required for the various critical trim, weight, and center of gravity conditions, the Administrator will require that tab systems be so designed as to provide reliability equivalent to that required for primary systems. Examples are pulley

sizes, guards, use of fairleads, inspection provisions, etc.

[12 F. R. 3437. Correction noted at 14 F. R. 36]

§ 3.346 *Joints.* Control system joints subject to angular motion in push-pull systems, excepting ball and roller bearing systems, shall incorporate a multiplying factor of safety of not less than 3.33 with respect to the ultimate bearing strength of the softest material used as a bearing. This factor may be reduced to 2.0 for such joints in cable control systems. For ball or roller bearings the approved rating of the bearing shall not be exceeded.

§ 3.347 *Spring devices.* The reliability of any spring devices used in the control system shall be established by tests simulating service conditions, unless it is demonstrated that failure of the spring will not cause flutter or unsafe flight characteristics.

LANDING GEAR

SHOCK ABSORBERS

§ 3.351 *Tests.* Shock absorbing elements in main, nose, and tail wheel units shall be substantiated by the tests specified in the following section. In addition, the shock absorbing ability of the landing gear in taxiing must be demonstrated in the operational tests of § 3.146.

§ 3.352 *Shock absorption tests.* (a) It shall be demonstrated by energy absorption tests that the limit load factors selected for design in accordance with § 3.243 will not be exceeded in landings with the limit descent velocity specified in that section.

(b) In addition, a reserve of energy absorption shall be demonstrated by a test in which the descent velocity is at least 1.2 times the limit descent velocity. In this test there shall be no failure of the shock absorbing unit, although yielding of the unit will be permitted. Wing lift equal to the weight of the airplane may be assumed for purposes of this test.

§ 3.352-1 *Landing gear drop tests (CAA policies which apply to § 3.352).*

(a) The following method has been approved by the Administrator for determining the effective mass to be dropped in drop tests of nose wheel landing gear assemblies pursuant to § 3.352 (a): For aircraft with nose wheel type gear, the effective mass to be used in free drop test of the nose wheel shall be determined from the formula for W_e (§§ 3.353 and 3.355) using $W = W_n$ where W_n is equal to the vertical components of the resultant force acting on the nose wheel, computed under the following assumptions: (1) the mass of the airplane concentrated at the center of gravity and exerting a force of 1.0 g downward and 0.33 g forward, (2) the nose and the main gears and tires in static position, and (3) the resultant reactions at the main and nose gears acting through the axles and parallel to the resultant force at the airplane center of gravity.

NOTE: By way of explanation, the use of an inclined reactions condition as the basis for determining the mass to be dropped with a nose wheel unit is based on rational dynamic investigation of the landing condition, as-

suming the landing is made with simultaneous three-point contact, zero pitching velocity, and a drag component representing the average wheel spin-up reactions during the landing impact. Although spin-up loads on small airplanes may be less than the value implied by the formula, such airplanes are more likely to be landed with a nosing down pitching velocity, or in soft ground. The vertical component of the ground reaction is specified above because the method of defining the direction of the inertia force at the center of gravity gives a resultant effective mass greater than that of the airplane.

(b) The following procedure has been approved by the Administrator for determining the attitude in which the landing gear unit should be dropped pursuant to § 3.352 (a): The attitude in which a landing gear unit is dropped shall be that which simulates the airplane landing condition which is critical from the standpoint of energy to be absorbed by the particular unit, thus: (1) For nose wheel type landing gear, the nose wheel gear shall be drop tested in an attitude which simulates the three point landing inclined reaction condition; (2) the attitude selected for main gear drop tests shall be that which simulates the two-wheel level landing with inclined reactions condition.

NOTE: In addition, it is recommended that the main gear be dropped in an attitude simulating the tail-down landing with vertical reactions condition if the geometry of the gear is such that this condition is likely to result in shock strut action appreciably different from that obtained in level attitude drop tests; for example, when a cantilever shock strut has a large inclination with respect to the direction of the ground reaction.

(3) Tail wheel units shall be tested in such a manner as to simulate the tail-down landing condition (three-point contact). Drag components may be covered separately by the tail wheel "obstruction" condition.

(c) The Administrator has accepted the following procedure for determining slopes of inclined platforms when such are used in drop tests: When the arbitrary drag components given on Fig. 3-12 (a) of this part are used for the design of the landing gear in the level landing conditions, the drag loads in the drop tests for these conditions may be simulated by dropping the units onto inclined platforms so arranged as to obtain the proper direction of the resultant ground reactions in relation to the landing gear. (If wheel spin-up loads for these conditions are determined by rational methods and found to be more severe than the arbitrary drag loads, it is suggested that the spin-up loads be simulated by dropping the gear onto a level platform with wheels spinning.) In at least one limit drop test the platform should simulate the friction characteristics of paved runways and the rotational speed of the wheel just prior to contact should correspond to an airplane ground speed of $1.2 V_{SO}$. It is suggested that additional limit drops be made onto surfaces of lower friction coefficient and at several wheel rotational speeds; coefficients for example, corresponding to 0.6, 0.8 and $1.0 V_{SO}$. The direction of wheel rotation in the drop test should be opposite to that which would

occur in landing the airplane. Spin-up loads which are slightly greater than the arbitrary drag loads can probably be simulated satisfactorily by inclined platforms, but platforms having greater inclinations may not simulate spin-up loads correctly and are not recommended.

[12 F. R. 3437. Correction noted at 14 F. R. 36]

§ 3.353 *Limit drop tests.* (a) If compliance with the specified limit landing conditions of § 3.352 (a) is demonstrated by free drop tests, these shall be conducted on the complete airplane, or on units consisting of wheel, tire, and shock absorber in their proper relation, from free drop heights not less than the following:

$$h \text{ (inches)} = 3.6 (W/S)^{0.5}$$

except that the free drop height shall not be less than 9.2 inches and need not be greater than 18.7 inches.

(b) In simulating the permissible wing lift in free drop tests, the landing gear unit shall be dropped with an effective mass equal to:

$$W_e = W \left[\frac{h + (1-L) d}{h + d} \right]$$

where

W_e = the effective weight to be used in the drop test.

h = specified height of drop in inches.

d = deflection under impact of the tire (at the approved inflation pressure) plus the vertical component of the axle travel relative to the drop mass. The value of d used in the computation of W_e shall not exceed the value actually obtained in the drop tests.

$W = W_M$ for main gear units, and shall be equal to the static weight on the particular unit with the airplane in the level attitude (with the nose wheel clear, in the case of nose wheel type airplanes).

$W = W_T$ for tail gear units, and shall be equal to the static weight on the tail unit with the airplane in the tail down attitude.

$W = W_N$ for nose wheel units, and shall be equal to the static reaction which will exist at the nose wheel when the mass of the airplane is concentrated at the center of gravity and exerts a force of $1.0g$ downward and $0.33g$ forward.

L = ratio of assumed wing lift to airplane weight, not greater than 0.667.

The attitude in which the landing gear unit is drop tested shall be such as to simulate the airplane landing condition which is critical from the standpoint of energy to be absorbed by the particular unit.

§ 3.354 *Limit load factor determination.* In determining the limit airplane inertia load factor n from the free drop test described above, the following formula shall be used:

$$n = n_j \frac{W_e}{W} + L$$

where

n_j = the load factor developed in the drop test, i. e., the acceleration (d_v/dt) in g 's recorded in the drop test, plus 1.0.

The value of n so determined shall not be greater than the limit inertia load factor used in the landing conditions, § 3.243.

§ 3.355 *Reserve energy absorption drop tests.* If compliance with the reserve energy absorption condition specified in § 3.352 (b) is demonstrated by free drop tests, the drop height shall be not less than 1.44 times the drop height specified in § 3.353. In simulating wing lift equal to the airplane weight, the units shall be dropped with an effective mass equal to

$$W_e = W \frac{h}{h + d}$$

where the symbols and other details are the same as in § 3.353.

RETRACTING MECHANISM

§ 3.356 *General.* The landing gear retracting mechanism and supporting structure shall be designed for the maximum load factors in the flight conditions when the gear is in the retracted position. It shall also be designed for the combination of friction, inertia, brake torque, and air loads occurring during retraction at any air speed up to $1.6V_{S1}$, flaps retracted and any load factors up to those specified for the flaps extended condition, § 3.190. The landing gear and retracting mechanism, including the wheel well doors, shall withstand flight loads with the landing gear extended at any speed up to at least $1.6 V_{S1}$, flaps retracted. Positive means shall be provided for the purpose of maintaining the wheels in the extended position.

§ 3.357 *Emergency operation.* When other than manual power for the operation of the landing gear is employed, an auxiliary means of extending the landing gear shall be provided.

§ 3.358 *Operation test.* Proper functioning of the landing gear retracting mechanism shall be demonstrated by operation tests.

§ 3.359 *Position indicator and warning device.* When retractable landing wheels are used, means shall be provided for indicating to the pilot when the wheels are secured in the extreme positions. In addition, landplanes shall be provided with an aural or equally effective warning device which shall function continuously after the throttle is closed until the gear is down and locked.

§ 3.359-1 *Wheel position indicators (CAA policies which apply to § 3.359).* The "means" required by § 3.359 may consist of lights of various colors. The signal "all lights out" will be considered by the Administrator as satisfactory if used to indicate intermediate gear positions but it will not be considered as providing adequate safety if used to indicate either extreme gear locked position.

[12 F. R. 3437. Correction noted at 14 F. R. 36]

§ 3.360 *Control.* See § 3.384.

WHEELS AND TIRES

§ 3.361 *Wheels.* (a) Main landing gear wheels (i. e., those nearest the airplane center of gravity) shall be of an approved type.

(b) The rated static load of each main wheel shall not be less than the design weight for ground loads (§ 3.242) divided by the number of main wheels.

Nose wheels shall have been tested for an ultimate radial load not less than the maximum nose wheel ultimate load obtained in the ground loads requirements, and for corresponding side and burst loads.

§ 3.362 *Tires.* A landing gear wheel may be equipped with any make or type of tire, provided that the tire is a proper fit on the rim of the wheel and provided that the approved tire rating is not exceeded under the following conditions:

(a) Load on main wheel tires equal to the airplane weight divided by the number of wheels.

(b) Load on nose wheel tires (to be compared with the dynamic rating established for such tires) equal to the reaction obtained at the nose wheel, assuming the mass of the airplane concentrated at the center of gravity and exerting a force of 1.0g downward and 0.31g forward, the reactions being distributed to the nose and main wheels by the principle of statics with the drag reaction at the ground applied only at those wheels having brakes. When specially constructed tires are used to support an airplane, the wheels shall be plainly and conspicuously marked to that effect. Such markings shall include the make, size, number of plies, and identification marking of the proper tire.

NOTE: Approved ratings are those assigned by the Tire and Rim Association or by the Administrator.

BRAKES

§ 3.363 *Brakes.* Brakes shall be installed which are adequate to prevent the airplane from rolling on a paved runway while applying take-off power to the critical engine, and of sufficient capacity to provide adequate speed control during taxiing without the use of excessive pedal or hand forces.

SKIS

§ 3.364 *Skis.* Skis shall be of an approved type. The approved rating of the skis shall not be less than the maximum weight of the airplane on which they are installed.

§ 3.365 *Installation.* (a) When type certificated skis are installed, the installation shall be made in accordance with the ski or airplane manufacturer's recommendations which shall have been approved by the Administrator. When other than type certificated skis are installed, data shall be submitted to the Administrator showing a dimensional drawing of the proposed method of attaching the skis, the sizes and material of the restraining members and attachment fittings.

(b) In addition to such shock cord(s) as may be provided, front and rear check cables shall be used on skis not equipped with special stabilizing devices.

§ 3.366 *Tests.* (a) If the airplane is of a model not previously approved with the specific ski installation, it shall satisfactorily pass a ground inspection of the installation, demonstrate satisfactory landing and taxiing characteristics, and comply with such flight tests as are found necessary to indicate that the airplane's flight characteristics are satisfactory with the skis installed.

(b) If the airplane is of a model previously approved with the specific ski installation, it need pass satisfactorily only a ground inspection of the installation.

HULLS AND FLOATS

§ 3.371 *Buoyancy (main seaplane floats).* (a) Main seaplane floats shall have a buoyancy in excess of that required to support the maximum weight of the airplane in fresh water as follows:

(1) 80 percent in the case of single floats.

(2) 90 percent in the case of double floats.

(b) Main seaplane floats for use on airplanes of 2,500 pounds or more maximum weight shall contain at least 5 watertight compartments of approximately equal volume. Main seaplane floats for use on airplanes of less than 2,500 pounds maximum weight shall contain at least four such compartments.

§ 3.372 *Buoyancy (boat seaplanes).* The hulls of boat seaplanes and amphibians shall be divided into watertight compartments in accordance with the following requirements:

(a) In airplanes of 5,000 pounds or more maximum weight, the compartments shall be so arranged that, with any two adjacent compartments flooded, the hull and auxiliary floats (and tires, if used) will retain sufficient buoyancy to support the maximum weight of the airplane in fresh water.

(b) In airplanes of 1,500 to 5,000 pounds maximum weight, the compartments shall be so arranged that, with any one compartment flooded, the hull and auxiliary floats (and tires, if used) will retain sufficient buoyancy to support the maximum weight of the airplane in fresh water.

(c) In airplanes of less than 1,500 pounds maximum weight, watertight subdivision of the hull is not required.

(d) Bulkheads may have watertight doors for the purpose of communication between compartments.

§ 3.373 *Water stability.* Auxiliary floats shall be so arranged that when completely submerged in fresh water, they will provide a righting moment which is at least 1.5 times the upsetting moment caused by the airplane being tilted. A greater degree of stability may be required by the Administrator in the case of large flying boats, depending on the height of the center of gravity above the water level, the area and location of wings and tail surfaces, and other considerations.

FUSELAGE

PILOT COMPARTMENT

§ 3.381 *General.* (a) The arrangement of the pilot compartment and its appurtenances shall provide a satisfactory degree of safety and assurance that the pilot will be able to perform all his duties and operate the controls in the correct manner without unreasonable concentration and fatigue.

(b) The primary flight control units listed on Figure 3-14, excluding cables and control rods, shall be so located with respect to the propellers that no portion of the pilot or controls lies in the region between the plane of rotation of any in-

board propeller and the surface generated by a line passing through the center of the propeller hub and making an angle of 5° forward or aft of the plane of rotation of the propeller.

§ 3.382 *Vision.* The pilot compartment shall be arranged to afford the pilot a sufficiently extensive, clear, and undistorted view for the safe operation of the airplane. During flight in a moderate rain condition, the pilot shall have an adequate view of the flight path in normal flight and landing, and have sufficient protection from the elements so that his vision is not unduly impaired. This may be accomplished by providing an openable window or by a means for maintaining a portion of the windshield in a clear condition without continuous attention by the pilot. The pilot compartment shall be free of glare and reflections which would interfere with the pilot's vision. For airplanes intended for night operation, the demonstration of these qualities shall include night flight tests.

§ 3.383 *Pilot windshield and windows.* All glass panes shall be of a nonsplintering safety type.

§ 3.384 *Cockpit controls.* (a) All cockpit controls shall be so located and, except for those the function of which is obvious, identified as to provide convenience in operation including provisions to prevent the possibility of confusion and consequent inadvertent operation. (See Fig. 3-14 for required sense of motion of cockpit controls.) The controls shall be so located and arranged that when seated it will be readily possible for the pilot to obtain full and unrestricted movement of each control without interference from either his clothing or the cockpit structure.

(b) Identical power-plant controls for the several engines in the case of multi-engine airplanes shall be so located as to prevent any misleading impression as to the engines to which they relate.

Controls	Movement and actuation
Primary:	
Aleron.....	Right (clockwise) for right wing down.
Elevator.....	Rearward for nose up.
Rudder.....	Right pedal forward for nose right.
Power plant:	
Throttle.....	Forward to open.

FIGURE 3-14 COCKPIT CONTROLS

§ 3.385 *Instruments and markings.* See § 3.661 relative to instrument arrangement. The operational markings, instructions, and placards required for the instruments and controls are specified in §§ 3.756 to 3.765.

EMERGENCY PROVISIONS

§ 3.386 *Protection.* The fuselage shall be designed to give reasonable assurance that each occupant, if he makes proper use of belts or harness for which provisions are made in the design, will not suffer serious injury during minor crash conditions as a result of contact of any vulnerable part of his body with any penetrating or relatively solid object, although it is accepted that parts of the airplane may be damaged.

(a) The ultimate accelerations to which occupants are assumed to be subjected shall be as follows:

	N, U	A
Upward.....	3.0g	4.5g
Forward.....	9.0g	9.0g
Sideward.....	1.5g	1.5g

(b) For airplanes having retractable landing gear, the fuselage in combination with other portions of the structure shall be designed to afford protection of the occupants in a wheels-up landing with moderate descent velocity.

(c) If the characteristics of an airplane are such as to make a turn-over reasonably probable, the fuselage of such an airplane in combination with other portions of the structure shall be designed to afford protection of the occupants in a complete turn-over.

NOTE: In § 3.386 (b) and (c), a vertical ultimate acceleration of 3g and a friction coefficient of 0.5 at the ground may be assumed.

§ 3.387 *Exits.* (a) Closed cabins on airplanes carrying more than 5 persons shall be provided with emergency exits consisting of movable windows or panels or of additional external doors which provide a clear and unobstructed opening, the minimum dimensions of which shall be such that a 19-by-26-inch ellipse may be completely inscribed therein. The exits shall be readily accessible, shall not require exceptional agility of a person using them, and shall be distributed so as to facilitate egress without crowding in all probable attitudes resulting from a crash. The method of opening shall be simple and obvious, and the exits shall be so arranged and marked as to be readily located and operated even in darkness. Reasonable provisions shall be made against the jamming of exits as a result of fuselage deformation. The proper functioning of exits shall be demonstrated by tests.

(b) The number of emergency exits required is as follows:

(1) Airplanes with a total seating capacity of more than 5 persons, but not in excess of 15, shall be provided with at least one emergency exit or one suitable door in addition to the main door specified in § 3.389. This emergency exit, or second door, shall be on the opposite side of the cabin from the main door.

(2) Airplanes with a seating capacity of more than 15 persons shall be provided with emergency exits or doors in addition to those required in paragraph (b) (1) of this section. There shall be one such additional exit or door located either in the top or side of the cabin for every additional 7 persons or fraction thereof above 15, except that not more than four exits, including doors, will be required if the arrangement and dimensions are suitable for quick evacuation of all occupants.

(c) If the pilot compartment is separated from the cabin by a door which is likely to block the escape in the event of a minor crash, it shall have its own exit, but such exit shall not be considered as an emergency exit for the passengers.

(d) In categories U and A exits shall be provided which will permit all occupants to bail out quickly with parachutes.

§ 3.388 *Fire precautions.*—(a) *Cabin interiors.* Only materials which are flame-resistant shall be used. In compartments where smoking is to be permitted, the materials of the cabin lining, floors, upholstery, and furnishings shall be flame-resistant. Such compartments shall be equipped with an adequate number of self-contained ash trays. All other compartments shall be placarded against smoking.

(b) *Combustion heaters.* Gasoline operated combustion heater installations shall comply with applicable parts of the power-plant installation requirements covering fire hazards and precautions. All applicable requirements concerning fuel tanks, lines, and exhaust systems shall be considered.

§ 3.388-1 *Combustion heaters (CAA rules which apply to § 3.388 (b)).* See § 4b.445-1 of this chapter.

[Supp. 3, 14 F. R. 3305]

PERSONNEL AND CARGO ACCOMMODATIONS

§ 3.389 *Doors.* Closed cabins on all airplanes carrying passengers shall be provided with at least one adequate and easily accessible external door. No passenger door shall be so located with respect to the propeller discs as to endanger persons using the door.

§ 3.390 *Seats and berths.*—(a) *Passenger seats and berths.* All seats and berths and supporting structure shall be designed for a passenger weight of 170 pounds (190 pounds with parachute for the acrobatic and utility categories) and the maximum load factors corresponding to all specified flight and ground load conditions including the emergency conditions of § 3.386.

(b) *Pilot seats.* Pilot seats shall be designed for the reactions resulting from the application of the pilot forces to the primary flight controls as specified in § 3.231.

(c) *Categories U and A.* All seats designed to be occupied in the U and A categories under § 3.74 (c) (4) shall be designed to accommodate passengers wearing parachutes.

§ 3.391 *Safety belt or harness provisions.* Provisions shall be made at all seats and berths for the installation of belts or harness of sufficient strength to comply with the emergency conditions of § 3.386.

§ 3.392 *Cargo compartments.* Each cargo compartment shall be designed for the placarded maximum weight of contents and critical load distributions at the appropriate maximum load factors corresponding to all specified flight and ground load conditions. Suitable provisions shall be made to prevent the contents of cargo compartments from becoming a hazard by shifting. Such provisions shall be adequate to protect the passengers from injury by the contents of any cargo compartment when the ultimate forward acting accelerating force is 4.5g.

§ 3.393 *Ventilation.* All passenger and crew compartments shall be suitably

ventilated. Carbon monoxide concentration shall not exceed 1 part in 20,000 parts of air.

MISCELLANEOUS

§ 3.401 *Leveling marks.* Leveling marks shall be provided for leveling the airplane on the ground.

SUBPART E—POWER-PLANT INSTALLATIONS; RECIPROCATING ENGINES

GENERAL

§ 3.411 *Components.* (a) The power-plant installation shall be considered to include all components of the airplane which are necessary for its propulsion. It shall also be considered to include all components which affect the control of the major propulsive units or which affect their continued safety of operation.

(b) All components of the power-plant installation shall be constructed, arranged, and installed in a manner which will assure the continued safe operation of the airplane and power plant. Accessibility shall be provided to permit such inspection and maintenance as is necessary to assure continued airworthiness.

§ 3.411-1 *Reverse-thrust propellers (CAA policies which apply to § 3.411 (b)).* In applying § 3.411 (b), the Administrator will approve as providing adequate safety only those reverse-thrust propeller installations which conform in all details with the following standards:

(a) Exceptional pilot skill shall not be required in taxiing or any condition in which reverse thrust is to be used.

(b) Recommended operating procedures and operating limitations and placards shall be established.

(c) Throttle movement shall be such that the motion is in the direction of the desired acceleration of the airplane.

(d) The airplane control characteristics shall be satisfactory with regard to control forces encountered, and buffeting shall not be such as to be likely to cause structural damage.

(e) The directional control shall be adequate using normal piloting skill.

(f) It shall be determined that no dangerous condition is encountered in the event of a sudden failure of one engine in any likely operating condition.

(g) The operating procedures and airplane configuration shall be such as to provide a reasonable safeguard against serious structural damage to parts of the airplane due to the reverse airflow.

(h) It shall be determined that the pilot's vision is not dangerously obscured under normal operating conditions on dusty or wet runways and where light snow is on the runway.

(i) It shall be impossible to place the propellers in the reverse-thrust position until the airplane is on the ground, unless it is demonstrated that it is safe to reverse the propellers in any likely flight condition. Consideration shall be given to possible rebound of the airplane following initial contact, at which point propeller reversal has taken place.

(j) The mechanism actuating the propeller and controlling the engine shall maintain sufficient power to keep the engine running at an adequate speed to prevent engine stalling during or after the propeller reversing operation.

(k) It shall not be possible under any likely condition to cause excessive overspeed of the propeller during the propeller reversing operation.

(l) The propeller control arrangement shall be such as to provide adequate safeguards against inadvertent reversal of propellers.

(m) The engine cooling characteristics shall be satisfactory when operated within the operating limitations.

(n) If it is desired to certificate reverse thrust for use in taxiing only, it will be permissible to omit requirement of items (c) and (i), if the following are complied with: Deliberate action with intent to reverse the propellers is required, and placard in plain view of pilot must warn not to reverse the propellers in the air and to be used for taxiing only.

[12 F. R. 3437. Correction noted at 14 F. R. 36]

ENGINES AND PROPELLERS

§ 3.415 *Engines.* Engines installed in certificated airplanes shall be of a type which has been certificated in accordance with the provisions of Part 13 of this chapter.

§ 3.416 *Propellers.* (a) Propellers installed in certificated airplanes shall be of a type which has been certificated in accordance with the provisions of Part 14 of this chapter.

(b) The maximum engine power and propeller shaft rotational speed permissible for use in the particular airplane involved shall not exceed the corresponding limits for which the propeller has been certificated.

§ 3.417 *Propeller vibration.* In the case of airplanes equipped with metal propellers, the magnitude of the propeller blade vibration stresses under all normal conditions of operation shall be determined by actual measurements or by comparison with similar installations for which such measurements have been made. The vibration stresses thus determined shall not exceed values which have been demonstrated to be safe for continuous operation. Vibration tests may be waived and the propeller installation accepted on the basis of service experience, engine or ground tests which show adequate margins of safety, or other considerations which satisfactorily substantiate its safety in this respect. In addition to metal propellers, the Administrator may require that similar substantiation of the vibration characteristics be accomplished for other types of propellers, with the exception of conventional fixed-pitch wood propellers.

§ 3.418 *Propeller pitch and speed limitations.* The propeller pitch and speed shall be limited to values which will assure safe operation under all normal conditions of operation and will assure compliance with the performance requirements specified in §§ 3.81-3.86.

§ 3.419 *Speed limitations for fixed-pitch propellers, ground adjustable pitch propellers, and automatically varying pitch propellers which cannot be controlled in flight.* (a) During take-off and initial climb at best rate-of-climb speed, the propeller, in the case of fixed pitch or

ground adjustable types, shall restrain the engine to a speed not exceeding its maximum permissible take-off speed and, in the case of automatic variable-pitch types, shall limit the maximum governed engine revolutions per minute to a speed not exceeding the maximum permissible take-off speed. In demonstrating compliance with this provision the engine shall be operated at full throttle or the throttle setting corresponding to the maximum permissible take-off manifold pressure.

(b) During a closed throttle glide at the placard, "never-exceed speed" (see § 3.739), the propeller shall not cause the engine to rotate at a speed in excess of 110 percent of its maximum allowable continuous speed.

§ 3.420 *Speed and pitch limitations for controllable pitch propellers without constant speed controls.* The stops or other means incorporated in the propeller mechanism to restrict the pitch range shall limit (a) the lowest possible blade pitch to a value which will assure compliance with the provisions of § 3.419 (a), and (b) the highest possible blade pitch to a value not lower than the flattest blade pitch with which compliance with the provisions of § 3.419 (b) can be demonstrated.

§ 3.421 *Variable pitch propellers with constant speed controls.* (a) Suitable means shall be provided at the governor to limit the speed of the propeller. Such means shall limit the maximum governed engine speed to a value not exceeding its maximum permissible take-off revolutions per minute.

(b) The low pitch blade stop, or other means incorporated in the propeller mechanism to restrict the pitch range, shall limit the speed of the engine to a value not exceeding 103 percent of the maximum permissible take-off revolutions per minute under the following conditions:

(1) Propeller blades set in the lowest possible pitch and the governor inoperative.

(2) Engine operating at take-off manifold pressure with the airplane stationary and with no wind.

§ 3.422 *Propeller clearance.* With the airplane loaded to the maximum weight and most adverse center of gravity position and the propeller in the most adverse pitch position, propeller clearances shall not be less than the following, unless smaller clearances are properly substantiated for the particular design involved:

(a) *Ground clearance.* (1) Seven inches (for airplanes equipped with nose wheel type landing gears) or 9 inches (for airplanes equipped with tail wheel type landing gears) with the landing gear statically deflected and the airplane in the level, normal take-off, or taxiing attitude, whichever is most critical.

(2) In addition to subparagraph (1) of this paragraph, there shall be positive clearance between the propeller and the ground when, with the airplane in the level take-off attitude, the critical tire is completely deflated and the corresponding landing gear strut is completely bottomed.

(b) *Water clearance.* A minimum clearance of 18 inches shall be provided

unless compliance with § 3.147 can be demonstrated with lesser clearance.

(c) *Structural clearance.* (1) One inch radial clearance between the blade tips and the airplane structure, or whatever additional radial clearance is necessary to preclude harmful vibration of the propeller or airplane.

(2) One-half inch longitudinal clearance between the propeller blades or cuffs and stationary portions of the airplane. Adequate positive clearance shall be provided between other rotating portions of the propeller or spinner and stationary portions of the airplane.

FUEL SYSTEM

§ 3.429 *General.* The fuel system shall be constructed and arranged in a manner to assure the provision of fuel to each engine at a flow rate and pressure adequate for proper engine functioning under all normal conditions of operation, including all maneuvers and acrobatics for which the airplane is intended.

ARRANGEMENT

§ 3.430 *Fuel system arrangement.* Fuel systems shall be so arranged as to permit any one fuel pump to draw fuel from only one tank at a time. Gravity feed systems shall not supply fuel to any one engine from more than one tank at a time unless the tank air spaces are interconnected in such a manner as to assure that all interconnected tanks will feed equally. (See also § 3.439.)

§ 3.431 *Multiengine fuel system arrangement.* The fuel systems of multiengine airplanes shall be arranged to permit operation in such a manner that the failure of any one component will not result in the loss of the power of more than one engine. Unless other provisions are made in order to comply with this requirement, the fuel system shall be arranged to permit supplying fuel to each engine through a system entirely independent of any portion of the system supplying fuel to the other engines.

§ 3.432 *Pressure cross feed arrangements.* Pressure cross feed lines shall not pass through portions of the airplane devoted to carrying personnel or cargo, unless means are provided to permit the flight personnel to shut off the supply of fuel to these lines, or unless any joints, fittings, or other possible sources of leakage installed in such lines are enclosed in a fuel- and fume-proof enclosure which is ventilated and drained to the exterior of the airplane. Bare tubing need not be enclosed but shall be protected where necessary against possible inadvertent damage.

OPERATION

§ 3.433 *Fuel flow rate.* The ability of the fuel system to provide the required fuel flow rate and pressure shall be demonstrated when the airplane is in the attitude which represents the most adverse condition from the standpoint of fuel feed and quantity of unusable fuel in the tank. During this test fuel shall be delivered to the engine at the applicable flow rate (see §§ 3.434-3.436) and at a pressure not less than the minimum required for proper carburetor operation.

A suitable mock-up of the system, in which the most adverse conditions are simulated, may be used for this purpose. The quantity of fuel in the tank being tested shall not exceed the amount established as the unusable fuel supply for that tank as determined by demonstration of compliance with the provisions of § 3.437 (see also §§ 3.440 and 3.672), plus whatever minimum quantity of fuel it may be necessary to add for the purpose of conducting the flow test. If a fuel flowmeter is provided, the meter shall be blocked during the flow test and the fuel shall flow through the meter bypass.

§ 3.434 *Fuel flow rate for gravity feed systems.* The fuel flow rate for gravity feed systems (main and reserve supply) shall be 1.2 pounds per hour for each take-off horsepower or 150 percent of the actual take-off fuel consumption of the engine, whichever is greater.

§ 3.435 *Fuel flow rate for pump systems.* The fuel flow rate for pump systems (main and reserve supply) shall be 0.9 pound per hour for each take-off horsepower or 125 percent of the actual take-off fuel consumption of the engine, whichever is greater. This flow rate shall be applicable to both the primary engine-driven pump and the emergency pumps and shall be available when the pump is running at the speed at which it would normally be operating during take-off. In the case of hand-operated pumps, this speed shall be considered to be not more than 60 complete cycles (120 single strokes) per minute.

§ 3.436 *Fuel flow rate for auxiliary fuel systems and fuel transfer systems.* The provisions of § 3.434 or § 3.435, whichever is applicable, shall also apply to auxiliary and transfer systems with the exception that the required fuel flow rate shall be established upon the basis of maximum continuous power and speed instead of take-off power and speed. A lesser flow rate shall be acceptable, however, in the case of a small auxiliary tank feeding into a large main tank, provided a suitable placard is installed to require that the auxiliary tank must only be opened to the main tank when a predetermined satisfactory amount of fuel still remains in the main tank.

§ 3.437 *Determination of unusable fuel supply and fuel system operation on low fuel.* (a) The unusable fuel supply for each tank shall be established as not less than the quantity at which the first evidence of malfunctioning occurs under the conditions specified in this section. (See also § 3.440.) In the case of airplanes equipped with more than one fuel tank, any tank which is not required to feed the engine in all of the conditions specified in this section need be investigated only for those flight conditions in which it shall be used and the unusable fuel supply for the particular tank in question shall then be based on the most critical of those conditions which are found to be applicable. In all such cases, information regarding the conditions under which the full amount of usable fuel in the tank can safely be used shall be made available to the operating personnel by means of a suitable placard or

instructions in the Airplane Flight Manual.

(b) Upon presentation of the airplane for test, the applicant shall stipulate the quantity of fuel with which he chooses to demonstrate compliance with this provision and shall also indicate which of the following conditions is most critical from the standpoint of establishing the unusable fuel supply. He shall also indicate the order in which the other conditions are critical from this standpoint:

(1) Level flight at maximum continuous power or the power required for level flight at V_0 , whichever is less.

(2) Climb at maximum continuous power at the calculated best angle of climb at minimum weight.

(3) Rapid application of power and subsequent transition to best rate of climb following a power-off glide at $1.3 V_{00}$.

(4) Sideslips and skids in level flight, climb, and glide under the conditions specified in subparagraphs (1), (2), and (3) of this paragraph, of the greatest severity likely to be encountered in normal service or in turbulent air.

(c) In the case of utility category airplanes, there shall be no evidence of malfunctioning during the execution of all approved maneuvers included in the Airplane Flight Manual. During this test the quantity of fuel in each tank shall not exceed the quantity established as the unusable fuel supply, in accordance with paragraph (b) of this section, plus 0.03 gallon for each maximum continuous horsepower for which the airplane is certificated.

(d) In the case of acrobatic category airplanes, there shall be no evidence of malfunctioning during the execution of all approved maneuvers included in the Airplane Flight Manual. During this test the quantity of fuel in each tank shall not exceed that specified in paragraph (c) of this section.

(e) If an engine can be supplied with fuel from more than one tank, it shall be possible to regain the full power and fuel pressure of that engine in not more than 10 seconds (for single-engine airplanes) or 20 seconds (for multiengine airplanes) after switching to any full tank after engine malfunctioning becomes apparent due to the depletion of the fuel supply in any tank from which the engine can be fed. Compliance with this provision shall be demonstrated in level flight.

(f) There shall be no evidence of malfunctioning during take-off and climb for 1 minute at the calculated attitude of best angle of climb at take-off power and minimum weight. At the beginning of this test the quantity of fuel in each tank shall not exceed that specified in paragraph (c) of this section.

§ 3.438 *Fuel system hot weather operation.* The fuel system shall be so arranged as to minimize the possibility of the formation of vapor lock in the system under all normal conditions of operation.

§ 3.439 *Flow between interconnected tanks.* In the case of gravity feed systems with tanks whose outlets are interconnected, it shall not be possible for fuel to flow between tanks in quantities

sufficient to cause an overflow of fuel from the tank vent when the airplane is operated as specified in § 3.437 (a) and the tanks are full.

FUEL TANKS

§ 3.440 *General.* Fuel tanks shall be capable of withstanding without failure any vibration, inertia, and fluid and structural loads to which they may be subjected in operation. Flexible fuel tank liners shall be of an acceptable type. Integral type fuel tanks shall be provided with adequate facilities for the inspection and repair of the tank interior. The total usable capacity of the fuel tanks shall not be less than 1 gallon for each seven maximum continuous rated horsepower for which the airplane is certificated. The unusable capacity shall be considered to be the minimum quantity of fuel which will permit compliance with the provisions of § 3.437. The fuel quantity indicator shall be adjusted to account for the unusable fuel supply as specified in § 3.672. If the unusable fuel supply in any tank exceeds 5 percent of the tank capacity or 1 gallon, whichever is greater, a placard and a suitable notation in the Airplane Flight Manual shall be provided to indicate to the flight personnel that the fuel remaining in the tank when the quantity indicator reads zero cannot be used safely in flight. The weight of the unusable fuel supply shall be included in the empty weight of the airplane.

§ 3.441 *Fuel tank tests.* (a) Fuel tanks shall be capable of withstanding the following pressure tests without failure or leakage. These pressures may be applied in a manner simulating the actual pressure distribution in service:

(1) Conventional metal tanks and non-metallic tanks whose walls are not supported by the airplane structure: A pressure of 3.5 psi or the pressure developed during the maximum ultimate acceleration of the airplane with a full tank, whichever is greater.

(2) Integral tanks: The pressure developed during the maximum limit acceleration of the airplane with a full tank, simultaneously with the application of the critical limit structural loads.

(3) Nonmetallic tanks the walls of which are supported by the airplane structure: Tanks constructed of an acceptable basic tank material and type of construction and with actual or simulated support conditions shall be subjected to a pressure of 2 psi for the first tank of a specific design. Subsequent tanks shall be production tested to at least 0.5 psi. The supporting structure shall be designed for the critical loads occurring in the flight or landing strength conditions combined with the fuel pressure loads resulting from the corresponding accelerations.

(b) (1) Tanks with large unsupported or unstiffened flat areas shall be capable of withstanding the following tests without leakage or failure. The complete tank assembly, together with its supports, shall be subjected to a vibration test when mounted in a manner simulating the actual installation. The tank assembly shall be vibrated for 25 hours at a total amplitude of not less than $1/32$ of an inch while filled $3/4$ full of water.

The frequency of vibration shall be 90 percent of the maximum continuous rated speed of the engine unless some other frequency within the normal operating range of speeds of the engine is more critical, in which case the latter speed shall be employed and the time of test shall be adjusted to accomplish the same number of vibration cycles.

(2) In conjunction with the vibration test, the tank assembly shall be rocked through an angle of 15° on either side of the horizontal (30° total) about an axis parallel to the axis of the fuselage. The assembly shall be rocked at the rate of 16 to 20 complete cycles per minute.

(c) Integral tanks which incorporate methods of construction and sealing not previously substantiated by satisfactory test data or service experience shall be capable of withstanding the vibration test specified in paragraph (b) of this section.

(d) (1) Tanks with nonmetallic liners shall be subjected to the sloshing portion of the test outlined under paragraph (b) of this section with fuel at room temperature.

(2) In addition, a specimen liner of the same basic construction as that to be used in the airplane shall, when installed in a suitable test tank, satisfactorily withstand the slosh test with fuel at a temperature of 110° F.

§ 3.442 *Fuel tank installation.* (a) The method of support for tanks shall not be such as to concentrate the loads resulting from the weight of the fluid in the tanks. Pads shall be provided to prevent chafing between the tank and its supports. Materials employed for padding shall be nonabsorbent or shall be treated to prevent the absorption of fluids. If flexible tank liners are employed, they shall be so supported that the liner is not required to withstand fluid loads. Interior surfaces of compartments for such liners shall be smooth and free of projections which are apt to cause wear of the liner, unless provisions are made for protection of the liner at such points or unless the construction of the liner itself provides such protection.

(b) Tank compartments shall be ventilated and drained to prevent the accumulation of inflammable fluids or vapors. Compartments adjacent to tanks which are an integral part of the airplane structure shall also be ventilated and drained.

(c) Fuel tanks shall not be located on the engine side of the fire wall. Not less than one-half inch of clear air space shall be provided between the fuel tank and the fire wall. No portion of engine nacelle skin which lies immediately behind a major air egress opening from the engine compartment shall act as the wall of an integral tank. Fuel tanks shall not be located in personnel compartments, except in the case of single-engine airplanes. In such cases fuel tanks the capacity of which does not exceed 25 gallons may be located in personnel compartments, if adequate ventilation and drainage are provided. In all other cases, fuel tanks shall be isolated from personnel compartments by means of fume and fuel proof enclosures.

§ 3.443 *Fuel tank expansion space.* Fuel tanks shall be provided with an expansion space of not less than 2 percent of the tank capacity, unless the tank vent discharges clear of the aircraft in which case no expansion space will be required. It shall not be possible inadvertently to fill the fuel tank expansion space when the airplane is in the normal ground attitude.

§ 3.444 *Fuel tank sump.* (a) Each tank shall be provided with a drainable sump having a capacity of not less than 0.25 percent of the tank capacity or 1/16 gallon, whichever is greater. The sump may be dispensed with if the fuel system is provided with a sediment bowl which will permit visual ground inspection for accumulation of water or other foreign material. The sediment bowl shall also be readily accessible for drainage. The capacity of the sediment chamber shall not be less than 1 ounce per each 20 gallons of the fuel tank capacity.

(b) If a fuel tank sump is provided, the capacity specified above shall be effective with the airplane in the normal ground attitude.

(c) If a separate sediment bowl is provided, the fuel tank outlet shall be so located that water will drain from all portions of the tank to the outlet when the airplane is in the ground attitude.

§ 3.445 *Fuel tank filler connection.* (a) Fuel tank filler connections shall be marked as specified in § 3.767.

(b) Provision shall be made to prevent the entrance of spilled fuel into the fuel tank compartment or any portions of the airplane other than the tank itself. The filler cap shall provide a fuel-tight seal for the main filler opening. However, small openings in the fuel tank cap for venting purposes or to permit passage of a fuel gauge through the cap shall be permissible.

§ 3.446 *Fuel tank vents and carburetor vapor vents.* (a) Fuel tanks shall be vented from the top portion of the expansion space. Vent outlets shall be so located and constructed as to minimize the possibility of their being obstructed by ice or other foreign matter. The vent shall be so constructed as to preclude the possibility of siphoning fuel during normal operation. The vent shall be of sufficient size to permit the rapid relief of excessive differences of pressure between the interior and exterior of the tank. Air spaces of tanks the outlets of which are interconnected shall also be interconnected. There shall be no undrainable points in the vent line where moisture is apt to accumulate with the airplane in either the ground or level flight attitude. Vents shall not terminate at points where the discharge of fuel from the vent outlet will constitute a fire hazard or from which fumes may enter personnel compartments.

(b) Carburetors which are provided with vapor elimination connections shall be provided with a vent line which will lead vapors back to one of the airplane fuel tanks. If more than one fuel tank is provided and it is necessary to use these tanks in a definite sequence for any reason, the vapor vent return line shall lead back to the fuel tank which

must be used first unless the relative capacities of the tanks are such that return to another tank is preferable.

§ 3.447-A *Fuel tank vents.* Provision shall be made to prevent excessive loss of fuel during acrobatic maneuvers including short periods of inverted flight. It shall not be possible for fuel to siphon from the vent when normal flight has been resumed after having executed any acrobatic maneuver for which the airplane is intended.

§ 3.448 *Fuel tank outlet.* The fuel tank outlet shall be provided with a screen of from 8 to 16 meshes per inch. If a finger strainer is used, the length of the strainer shall not be less than 4 times the outlet diameter. The diameter of the strainer shall not be less than the diameter of the fuel tank outlet. Finger strainers shall be accessible for inspection and cleaning.

FUEL PUMPS

§ 3.449 *Fuel pump and pump installation.* (a) If fuel pumps are provided to maintain a supply of fuel to the engine, at least one pump for each engine shall be directly driven by the engine. Fuel pumps shall be adequate to meet the flow requirements of the applicable portions of §§ 3.433-3.436.

(b) Emergency fuel pumps shall be provided to permit supplying all engines with fuel in case of the failure of any one engine-driven pump, unless the engine-driven pumps have been approved with the engines, in which case emergency pumps need not be provided. Similarly, if an engine fuel injection pump which has been certificated as an integral part of the engine is used, an emergency pump will not be required. Emergency pumps shall be capable of complying with the same flow requirements as are prescribed for the main pumps. Hand emergency pumps shall not require excessive effort for their continued operation at the rate of 60 complete cycles (120 single strokes) per minute. Emergency pumps shall be available for immediate use in case of the failure of any other pump.

LINE, FITTINGS, AND ACCESSORIES

§ 3.550 *Fuel system lines, fittings, and accessories.* Fuel lines shall be installed and supported in a manner which will prevent excessive vibration and will be adequate to withstand loads due to fuel pressure and accelerated flight conditions. Lines which are connected to components of the airplane between which relative motion might exist shall incorporate provisions for flexibility. Flexible hose shall be of an acceptable type.

§ 3.551 *Fuel valves.* (a) Means shall be provided to permit the flight personnel to shut off rapidly the flow of fuel to any engine individually in flight. Valves provided for this purpose shall be located on the side of the fire wall most remote from the engine.

(b) Shut-off valves shall be so constructed as to make it possible for the flight personnel to reopen the valves rapidly after they have once been closed.

(c) Valves shall be provided with either positive stops or "feel" in the on and off

positions and shall be supported in such a manner that loads resulting from their operation or from accelerated flight conditions are not transmitted to the lines connected to the valve. Valves shall be so installed that the effect of gravity and vibration will tend to turn their handles to the open rather than the closed position.

§ 3.552 *Fuel strainer.* A fuel strainer shall be provided between the fuel tank outlet and the carburetor inlet. If an engine-driven fuel pump is provided, the strainer shall be located between the tank outlet and the engine-driven pump inlet. The strainer shall be accessible for drainage and cleaning, and the strainer screen shall be removable.

DRAINS AND INSTRUMENTS

§ 3.553 *Fuel system drains.* Drains shall be provided to permit safe drainage of the entire fuel system and shall incorporate means for locking in the closed position.

§ 3.554 *Fuel system instruments.* (See §§ 3.655 and §§ 3.670 through 3.673.)

OIL SYSTEM

§ 3.561 *Oil system.* Each engine shall be provided with an independent oil system capable of supplying the engine with an ample quantity of oil at a temperature not exceeding the maximum which has been established as safe for continuous operation. The oil capacity of the system shall not be less than 1 gallon for every 25 gallons of fuel capacity. However, in no case shall the oil capacity be less than 1 gallon for each 75 maximum continuous horsepower of the engine(s) involved unless lower quantities can be substantiated.

§ 3.561-1 *"Capacity"* (CAA interpretations which apply to § 3.561). The word "capacity" as used in § 3.561 is interpreted by the Administrator as follows:

(a) Only the usable fuel system capacity need be considered.

(b) In a conventional oil system (no transfer system provided) only the usable oil tank capacity shall be considered. The quantity of oil in the engine oil lines, the oil radiator, or in the feathering reserve shall not be included. When an oil transfer system is installed, and the transfer pump is so located that it can pump some of the oil in the transfer lines into the main engine oil tanks, the quantity of oil in these lines which can be pumped by the transfer pump may be added to the oil capacity.

[12 F. R. 2438. Correction noted at 14 F. R. 36]

§ 3.562 *Oil cooling.* (See § 3.581 and pertinent sections.)

OIL TANKS

§ 3.563 *Oil tanks.* Oil tanks shall be capable of withstanding without failure all vibration, inertia, and fluid loads to which they might be subjected in operation. Flexible oil tank liners shall be of an acceptable type.

§ 3.564 *Oil tank tests.* Oil tank tests shall be the same as fuel tank tests (see § 3.441), except as follows:

(a) The 3.5 psi pressure specified in § 3.441 (a) shall be 5 pounds psi.

(b) In the case of tanks with non-metallic liners, the test fluid shall be oil rather than fuel as specified in § 3.441 (d) and the slosh test on a specimen liner shall be conducted with oil at a temperature of 250° F.

§ 3.565 *Oil tank installation.* Oil tank installations shall comply with the requirements of § 3.442 (a) and (b).

§ 3.566 *Oil tank expansion space.* Oil tanks shall be provided with an expansion space of not less than 10 percent of the tank capacity or ½ gallon, whichever is greater. It shall not be possible inadvertently to fill the oil tank expansion space when the airplane is in the normal ground attitude.

§ 3.567 *Oil tank filler connection.* Oil tank filler connections shall be marked as specified in § 3.767.

§ 3.568 *Oil tank vent.* (a) Oil tanks shall be vented to the engine crankcase from the top of the expansion space in such a manner that the vent connection is not covered by oil under any normal flight conditions. Oil tank vents shall be so arranged that condensed water vapor which might freeze and obstruct the line cannot accumulate at any point.

(b) *Category A.* Provision shall be made to prevent hazardous loss of oil during acrobatic maneuvers including short periods of inverted flight.

§ 3.569 *Oil tank outlet.* The oil tank outlet shall not be enclosed or covered by any screen or other guard which might impede the flow of oil. The diameter of the oil tank outlet shall not be less than the diameter of the engine oil pump inlet. (See also § 3.577.)

LINES, FITTINGS, AND ACCESSORIES

§ 3.570 *Oil system lines, fittings, and accessories.* Oil lines shall comply with the provisions of § 3.550, except that the inside diameter of the engine oil inlet and outlet lines shall not be less than the diameter of the corresponding engine oil pump inlet and outlet.

§ 3.571 *Oil valves.* (See § 3.637.)

§ 3.572 *Oil radiators.* Oil radiators and their support shall be capable of withstanding without failure any vibration, inertia, and oil pressure loads to which they might normally be subjected.

§ 3.573 *Oil filters.* If the engine is equipped with an oil filter, the filter shall be constructed and installed in such a manner that complete blocking of the flow through the filter element will not jeopardize the continued operation of the engine oil supply system.

§ 3.574 *Oil system drains.* Drains shall be provided to permit safe drainage of the entire oil system and shall incorporate means for positive locking in the closed position.

§ 3.575 *Engine breather lines.* (a) Engine breather lines shall be so arranged that condensed water vapor which might freeze and obstruct the line cannot accumulate at any point. Breathers shall discharge in a location which will not constitute a fire hazard in case foaming occurs and so that oil emitted from the line will not impinge upon the pilot's windshield. The

breather shall not discharge into the engine air induction system.

(b) *Category A.* In the case of acrobatic type airplanes, provision shall be made to prevent excessive loss of oil from the breather during acrobatic maneuvers including short periods of inverted flight.

§ 3.576 *Oil system instruments.* See §§ 3.655, 3.670, 3.671, and 3.674.

§ 3.577 *Propeller feathering system.* If the propeller feathering system is dependent upon the use of the engine oil supply, provision shall be made to trap a quantity of oil in the tank in case the supply becomes depleted due to failure of any portion of the lubricating system other than the tank itself. The quantity of oil so trapped shall be sufficient to accomplish the feathering operation and shall be available only to the feathering pump. The ability of the system to accomplish feathering when the supply of oil has fallen to the above level shall be demonstrated.

COOLING

§ 3.581 *General.* The power-plant cooling provisions shall be capable of maintaining the temperatures of all power-plant components, engine parts, and engine fluids (oil and coolant), at or below the maximum established safe values under critical conditions of ground and flight operation.

TESTS

§ 3.582 *Cooling tests.* Compliance with the provisions of § 3.581 shall be demonstrated under critical ground, water, and flight operating conditions. If the tests are conducted under conditions which deviate from the highest anticipated summer air temperature (see § 3.583), the recorded power-plant temperatures shall be corrected in accordance with the provisions of §§ 3.584 and 3.585. The corrected temperatures determined in this manner shall not exceed the maximum established safe values. The fuel used during the cooling tests shall be of the minimum octane number approved for the engines involved, and the mixture settings shall be those appropriate to the operating conditions. The test procedures shall be as outlined in §§ 3.586 and 3.587.

§ 3.583 *Maximum anticipated summer air temperatures.* The maximum anticipated summer air temperature shall be considered to be 100° F. at sea level and to decrease from this value at the rate of 3.6° F. per thousand feet of altitude above sea level.

§ 3.584 *Correction factor for cylinder head, oil inlet, carburetor air, and engine coolant inlet temperatures.* These temperatures shall be corrected by adding the difference between the maximum anticipated summer air temperature and the temperature of the ambient air at the time of the first occurrence of maximum head, air, oil, or coolant temperature recorded during the cooling test.

§ 3.585 *Correction factor for cylinder barrel temperatures.* Cylinder barrel temperatures shall be corrected by adding 0.7 of the difference between the maximum anticipated summer air temperature and the temperature of the am-

bient air at the time of the first occurrence of the maximum cylinder barrel temperature recorded during the cooling test.

§ 3.586 Cooling test procedure for single-engine airplanes. This test shall be conducted by stabilizing engine temperatures in flight and then starting at the lowest practicable altitude and climbing for 1 minute at take-off power. At the end of 1 minute, the climb shall be continued at maximum continuous power until at least 5 minutes after the occurrence of the highest temperature recorded. The climb shall not be conducted at a speed greater than the best rate-of-climb speed with maximum continuous power unless:

(a) The slope of the flight path at the speed chosen for the cooling test is equal to or greater than the minimum required angle of climb (see § 3.85 (a)), and

(b) A cylinder head temperature indicator is provided as specified in § 3.675.

§ 3.587 Cooling test procedure for multiengine airplanes—(a) Airplanes which meet the minimum one-engine-inoperative climb performance specified in § 3.85 (b). The engine cooling test for these airplanes shall be conducted with the airplane in the configuration specified in § 3.85 (b), except that the operating engine(s) shall be operated at maximum continuous power or at full throttle when above the critical altitude. After stabilizing temperatures in flight, the climb shall be started at the lower of the two following altitudes and shall be continued until at least 5 minutes after the highest temperature has been recorded:

(1) 1,000 feet below the engine critical altitude or at the lowest practicable altitude (when applicable).

(2) 1,000 feet below the altitude at which the single-engine-inoperative rate of climb is $0.02 V_{SO}^2$.

The climb shall be conducted at a speed not in excess of the highest speed at which compliance with the climb requirement of § 3.85 (b) can be shown. However, if the speed used exceeds the speed for best rate of climb with one engine inoperative, a cylinder head temperature indicator shall be provided as specified in § 3.675.

(b) Airplanes which cannot meet the minimum one-engine-inoperative climb performance specified in § 3.85 (b). The engine cooling test for these airplanes shall be the same as in paragraph (a) of this section, except that after stabilizing temperatures in flight, the climb (or descent, in the case of airplanes with zero or negative one-engine-inoperative rate of climb) shall be commenced at as near sea level as practicable and shall be conducted at the best rate-of-climb speed (or the speed of minimum rate of descent, in the case of airplanes with zero or negative one-engine-inoperative rate of climb).

LIQUID COOLING SYSTEMS

§ 3.588 Independent systems. Each liquid cooled engine shall be provided with an independent cooling system. The cooling system shall be so arranged that no air or vapor can be trapped in

any portion of the system, except the expansion tank, either during filling or during operation.

§ 3.589 Coolant tank. A coolant tank shall be provided. The tank capacity shall not be less than 1 gallon plus 10 percent of the cooling system capacity. Coolant tanks shall be capable of withstanding without failure all vibration, inertia, and fluid loads to which they may be subjected in operation. Coolant tanks shall be provided with an expansion space of not less than 10 percent of the total cooling system capacity. It shall not be possible inadvertently to fill the expansion space with the airplane in the normal ground attitude.

§ 3.590 Coolant tank tests. Coolant tank tests shall be the same as fuel tank tests (see § 3.441), except as follows:

(a) The 3.5 pounds per square inch pressure test of § 3.441 (a) shall be replaced by the sum of the pressure developed during the maximum ultimate acceleration with a full tank or a pressure of 3.5 pounds per square inch, whichever is greater, plus the maximum working pressure of the system.

(b) In the case of tanks with non-metallic liners, the test fluid shall be coolant rather than fuel as specified in § 3.441 (d), and the slosh test on a specimen liner shall be conducted with coolant at operating temperature.

§ 3.591 Coolant tank installation. Coolant tanks shall be supported in a manner so as to distribute the tank loads over a large portion of the tank surface. Pads shall be provided to prevent chafing between the tank and the support. Material used for padding shall be nonabsorbent or shall be treated to prevent the absorption of inflammable fluids.

§ 3.592 Coolant tank filler connection. Coolant tank filler connections shall be marked as specified in § 3.767. Provisions shall be made to prevent the entrance of spilled coolant into the coolant tank compartment or any portions of the airplane other than the tank itself. Recessed coolant filler connections shall be drained and the drain shall discharge clear of all portions of the airplane.

§ 3.593 Coolant lines, fittings, and accessories. Coolant lines shall comply with the provisions of § 3.550, except that the inside diameter of the engine coolant inlet and outlet lines shall not be less than the diameter of the corresponding engine inlet and outlet connections.

§ 3.594 Coolant radiators. Coolant radiators shall be capable of withstanding without failure any vibration, inertia, and coolant pressure loads to which they may normally be subjected. Radiators shall be supported in a manner which will permit expansion due to operating temperatures and prevent the transmittal of harmful vibration to the radiator. If the coolant employed is inflammable, the air intake duct to the coolant radiator shall be so located that flames issuing from the nacelle in case of fire cannot impinge upon the radiator.

§ 3.595 Cooling system drains. One or more drains shall be provided to permit drainage of the entire cooling system, including the coolant tank, radiator, and the engine, when the airplane is in the normal ground attitude. Drains shall discharge clear of all portions of the airplane and shall be provided with means for positively locking the drain in the closed position. Cooling system drains shall be accessible.

§ 3.596 Cooling system instruments. See §§ 3.655, 3.670, and 3.671.

INDUCTION SYSTEM

§ 3.605 General. (a) The engine air induction system shall permit supplying an adequate quantity of air to the engine under all conditions of operation.

(b) Each engine shall be provided with at least two separate air intake sources, except that in the case of an engine equipped with a fuel injector only one air intake source need be provided, if the air intake, opening, or passage is unobstructed by a screen, filter, or other part on which ice might form and so restrict the air flow as to affect adversely engine operation. Primary and alternate air intakes may open within the cowl only if that portion of the cowl is isolated from the engine accessory section by means of a fireproof diaphragm. Alternate air intakes shall be located in a sheltered position. Supplying air to the engine through the alternate air intake system or the carburetor air preheater shall not result in the loss of excessive power in addition to the power lost due to the rise in the temperature of the air.

§ 3.606 Induction system de-icing and anti-icing provisions. The engine air induction system shall incorporate means for the prevention and elimination of ice accumulations in accordance with the provisions in this section. It shall be demonstrated that compliance with the provisions outlined in the following paragraphs can be accomplished when the airplane is operating in air at a temperature of 30° F. when the air is free of visible moisture.

(a) Airplanes equipped with sea level engines employing conventional venturi carburetors shall be provided with a preheater capable of providing a heat rise of 90° F. when the engine is operating at 75 percent of its maximum continuous power.

(b) Airplanes equipped with altitude engines employing conventional venturi carburetors shall be provided with a preheater capable of providing a heat rise of 120° F. when the engine is operating at 75 percent of its maximum continuous power.

(c) Airplanes equipped with altitude engines employing carburetors which embody features tending to reduce the possibility of ice formation shall be provided with a preheater capable of providing a heat rise of 100° F. when the engine is operating at 60 percent of its maximum continuous power. However, the preheater need not provide a heat rise in excess of 40° F. if a fluid de-icing system complying with the provisions of §§ 3.607-3.609 is also installed.

§ 3.607 Carburetor de-icing fluid flow rate. The system shall be capable of

providing each engine with a rate of fluid flow, expressed in pounds per hour, of not less than 2.5 multiplied by the square root of the maximum continuous power of the engine. This flow shall be available to all engines simultaneously. The fluid shall be introduced into the air induction system at a point close to, and upstream from, the carburetor. The fluid shall be introduced in a manner to assure its equal distribution over the entire cross section of the induction system air passages.

§ 3.608 *Carburetor fluid de-icing system capacity.* The fluid de-icing system capacity shall not be less than that required to provide fluid at the rate specified in § 3.607 for a time equal to 3 percent of the maximum endurance of the airplane. However, the capacity need not in any case exceed that required for 2 hours of operation nor shall it be less than that required for 20 minutes of operation at the above flow rate. If the available preheat exceeds 50° F. but is less than 100° F., it shall be permissible to decrease the capacity of the system in proportion to the heat rise available in excess of 50° F.

§ 3.609 *Carburetor fluid de-icing system detail design.* Carburetor fluid de-icing systems shall comply with provisions for the design of fuel systems, except as specified in §§ 3.607 and 3.608, unless such provisions are manifestly inapplicable.

§ 3.610 *Carburetor air preheater design.* Means shall be provided to assure adequate ventilation of the carburetor air preheater when the engine is being operated in cold air. The preheater shall be constructed in such a manner as to permit inspection of exhaust manifold parts which it surrounds and also to permit inspection of critical portions of the preheater itself.

§ 3.611 *Induction system ducts.* Induction system ducts shall be provided with drains which will prevent the accumulation of fuel or moisture in all normal ground and flight attitudes. No open drains shall be located on the pressure side of turbo-supercharger installations. Drains shall not discharge in a location which will constitute a fire hazard. Ducts which are connected to components of the airplane between which relative motion may exist shall incorporate provisions for flexibility.

§ 3.612 *Induction system screens.* If induction system screens are employed, they shall be located upstream from the carburetor. It shall not be possible for fuel to impinge upon the screen. Screens shall not be located in portions of the induction system which constitute the only passage through which air can reach the engine, unless the available preheat is 100° F. or over and the screen is so located that it can be de-iced by the application of heated air. De-icing of screens by means of alcohol in lieu of heated air shall not be acceptable.

EXHAUST SYSTEM

§ 3.615 *General.* (a) The exhaust system shall be constructed and arranged in such a manner as to assure the safe disposal of exhaust gases with-

out the existence of a hazard of fire or carbon monoxide contamination of air in personnel compartments.

(b) Unless suitable precautions are taken, exhaust system parts shall not be located in close proximity to portions of any systems carrying inflammable fluids or vapors nor shall they be located under portions of such systems which may be subject to leakage. All exhaust system components shall be separated from adjacent inflammable portions of the airplane which are outside the engine compartment by means of fireproof shields. Exhaust gases shall not be discharged at a location which will cause a glare seriously affecting pilot visibility at night, nor shall they discharge within dangerous proximity of any fuel or oil system drains. All exhaust system components shall be ventilated to prevent the existence of points of excessively high temperature.

§ 3.616 *Exhaust manifold.* Exhaust manifolds shall be made of fireproof, corrosion-resistant materials, and shall incorporate provisions to prevent failure due to their expansion when heated to operating temperatures. Exhaust manifolds shall be supported in a manner adequate to withstand all vibration and inertia loads to which they might be subjected in operation. Portions of the manifold which are connected to components between which relative motion might exist shall incorporate provisions for flexibility.

§ 3.617 *Exhaust heat exchangers.* (a) Exhaust heat exchangers shall be constructed and installed in such a manner as to assure their ability to withstand without failure all vibration, inertia, and other loads to which they might normally be subjected. Heat exchangers shall be constructed of materials which are suitable for continued operation at high temperatures and which are adequately resistant to corrosion due to products contained in exhaust gases.

(b) Provisions shall be made for the inspection of all critical portions of exhaust heat exchangers, particularly if a welded construction is employed. Heat exchangers shall be ventilated under all conditions in which they are subject to contact with exhaust gases.

§ 3.618 *Exhaust heat exchangers used in ventilating air heating systems.* Heat exchangers of this type shall be so constructed as to preclude the possibility of exhaust gases entering the ventilating air.

FIRE WALL AND COWLING

§ 3.623 *Fire walls.* All engines, auxiliary power units, fuel burning heaters, and other combustion equipment which are intended for operation in flight shall be isolated from the remainder of the airplane by means of fire walls, or shrouds, or other equivalent means.

§ 3.624 *Fire wall construction.* (a) Fire walls and shrouds shall be constructed in such a manner that no hazardous quantity of air, fluids, or flame can pass from the engine compartment to other portions of the airplane. All openings in the fire wall or shroud shall be sealed with close-fitting fireproof grommets, bushings, or fire-wall fittings.

(b) Fire walls and shrouds shall be constructed of fireproof material and shall be protected against corrosion. The following materials have been found to comply with this requirement:

(1) Heat- and corrosion-resistant steel 0.015 inch thick,

(2) Low carbon steel, suitably protected against corrosion, 0.018 inch thick.

§ 3.625 *Cowling.* (a) Cowling shall be constructed and supported in such a manner as to be capable of resisting all vibration, inertia, and air loads to which it may normally be subjected. Provision shall be made to permit rapid and complete drainage of all portions of the cowling in all normal ground and flight attitudes. Drains shall not discharge in locations constituting a fire hazard.

(b) Cowling shall be constructed of fire-resistant material. All portions of the airplane lying behind openings in the engine compartment cowling shall also be constructed of fire-resistant materials for a distance of at least 24 inches aft of such openings. Portions of cowling which are subjected to high temperatures due to proximity to exhaust system ports or exhaust gas impingement shall be constructed of fireproof material.

§ 3.625-1 *Fire-resistant aircraft material (CAA rules which apply to § 3.625).* See § 4b.448-3 of this chapter.

[13 F. R. 7723]

POWER-PLANT CONTROLS AND ACCESSORIES

CONTROLS

§ 3.627 *Power-plant controls.* Power-plant controls shall comply with the provisions of §§ 3.384 and 3.759. Controls shall maintain any necessary position without constant attention by the flight personnel and shall not tend to creep due to control loads or vibration. Flexible controls shall be of an acceptable type. Controls shall have adequate strength and rigidity to withstand operating loads without failure or excessive deflection.

§ 3.628 *Throttle controls.* A throttle control shall be provided to give independent control for each engine. Throttle controls shall afford a positive and immediately responsive means of controlling the engine(s). Throttle controls shall be grouped and arranged in such a manner as to permit separate control of each engine and also simultaneous control of all engines.

§ 3.629 *Ignition switches.* Ignition switches shall provide control for each ignition circuit on each engine. It shall be possible to shut off quickly all ignition on multiengine airplanes, either by grouping of the individual switches or by providing a master ignition control. If a master control is provided, suitable means shall be incorporated to prevent its inadvertent operation.

§ 3.630 *Mixture controls.* If mixture controls are provided, a separate control shall be provided for each engine. The controls shall be grouped and arranged in such a manner as to permit both separate and simultaneous control of all engines.

§ 3.631 *Propeller speed and pitch controls.* (See also § 3.421 (a).) If propeller speed or pitch controls are provided, the controls shall be grouped and arranged in such a manner as to permit control of all propellers, both separately and together. The controls shall permit ready synchronization of all propellers on multiengine airplanes.

§ 3.632 *Propeller feathering controls.* If propeller feathering controls are provided, a separate control shall be provided for each propeller. Propeller feathering controls shall be provided with means to prevent inadvertent operation.

§ 3.633 *Fuel system controls.* Fuel system controls shall comply with requirements of § 3.551 (c).

§ 3.634 *Carburetor air preheat controls.* Separate controls shall be provided to regulate the temperature of the carburetor air for each engine.

ACCESSORIES

§ 3.635 *Power-plant accessories.* Engine-driven accessories shall be of a type satisfactory for installation on the engine involved and shall utilize the provisions made on the engine for the mounting of such units. Items of electrical equipment subject to arcing or sparking shall be installed so as to minimize the possibility of their contact with any inflammable fluids or vapors which might be present in a free state.

§ 3.636 *Engine battery ignition systems.* (a) Battery ignition systems shall be supplemented with a generator which is automatically made available as an alternate source of electrical energy to permit continued engine operation in the event of the depletion of any battery.

(b) The capacity of batteries and generators shall be sufficient to meet the simultaneous demands of the engine ignition system and the greatest demands of any of the airplane's electrical system components which may draw electrical energy from the same source. Consideration shall be given to the condition of an inoperative generator, and to the condition of a completely depleted battery when the generator is running at its normal operating speed. If only one battery is provided, consideration shall also be given to the condition in which the battery is completely depleted and the generator is operating at idling speed.

(c) Means shall be provided to warn the appropriate flight personnel if malfunctioning of any part of the electrical system is causing the continuous discharging of a battery used for engine ignition. (See § 3.629 for ignition switches.)

POWER-PLANT FIRE PROTECTION

§ 3.637 *Power-plant fire protection.* Suitable means shall be provided to shut off the flow in all lines carrying inflammable fluids into the engine compartment.

SUBPART F—EQUIPMENT

§ 3.651 *General.* The equipment specified in § 3.655 shall be the minimum installed when the airplane is submitted to determine its compliance with the

airworthiness requirements. Such additional equipment as is necessary for a specific type of operation is specified in other pertinent parts of the Civil Air Regulations, but, where necessary, its installation and that of the items mentioned in § 3.655 is covered herein.

§ 3.652 *Functional and installational requirements.* Each item of equipment which is essential to the safe operation of the airplane shall be found by the Administrator to perform adequately the functions for which it is to be used, shall function properly when installed, and shall be adequately labeled as to its identification, function, operational limitations, or any combination of these, whichever is applicable. Items of equipment for which type certification is required shall have been certificated in accordance with the provisions of Part 15 of this chapter (or previous regulations) and such other parts as may be applicable.

BASIC EQUIPMENT

§ 3.655 *Required basic equipment.* The following table shows the basic equipment items required for type and airworthiness certification of an airplane:

(a) *Flight and navigational instruments.* (1) Air-speed indicator (see § 3.663).

(2) Altimeter.

(3) Magnetic direction indicator (see § 3.666).

(b) *Power-plant instruments—(1) For each engine or tank.* (i) Fuel quantity indicator (see § 3.672).

(ii) Oil pressure indicator.

(iii) Oil temperature indicator.

(iv) Tachometer.

(2) *For each engine or tank (if required in reference section).* (i) Carburetor air temperature indicator (see § 3.676).

(ii) Coolant temperature indicator (if liquid-cooled engines used).

(iii) Cylinder head temperature indicator (see § 3.675).

(iv) Fuel pressure indicator (if pump-fed engines used).

(v) Manifold pressure indicator (if altitude engines used).

(vi) Oil quantity indicator (see § 3.674).

(c) *Electrical equipment (if required by reference section).* (1) Master switch arrangement (see § 3.688).

(2) Adequate source(s) of electrical energy (see §§ 3.682 and 3.685).

(3) Electrical protective devices (see § 3.690).

(d) *Miscellaneous equipment.* (1) Certificated safety belts for all occupants (see Part 15 of this chapter).

(2) Airplane Flight Manual (see § 3.777).

§ 3.655-1 *Air-speed indicators, direction indicators, and altimeters (CAA rules which apply to § 3.655).* See §§ 4b.691-1, 4b.691-6, and 4b.691-8 of this chapter.

[13 F. R. 7725]

INSTRUMENTS; INSTALLATION

GENERAL

§ 3.661 *Arrangement and visibility of instrument installations.* (a) Flight,

navigation, and power-plant instruments for use by each pilot shall be easily visible to him.

(b) On multiengine airplanes, identical power-plant instruments for the several engines shall be so located as to prevent any confusion as to the engines to which they relate.

§ 3.662 *Instrument panel vibration characteristics.* Vibration characteristics of the instrument panel shall not be such as to impair the accuracy of the instruments or to cause damage to them.

FLIGHT AND NAVIGATIONAL INSTRUMENTS

§ 3.663 *Air-speed indicating system.* This system shall be so installed that the air-speed indicator shall indicate true air speed at sea level under standard conditions to within an allowable installational error of not more than plus or minus 3 percent of the calibrated air speed or 5 miles per hour, whichever is greater, throughout the operating range of the airplane with flaps up from V_0 to $1.3 V_{S1}$, and with flaps down at $1.3 V_{S1}$. The calibration shall be made in flight.

§ 3.664 *Air-speed indicator marking.* The air-speed indicator shall be marked as specified in § 3.757.

§ 3.665 *Static air vent system.* All instruments provided with static air case connections shall be so vented that the influence of airplane speed, the opening and closing of windows, air-flow variation, moisture, or other foreign matter will not seriously affect their accuracy.

§ 3.666 *Magnetic direction indicator.* The magnetic direction indicator shall be so installed that its accuracy shall not be excessively affected by the airplane's vibration or magnetic fields. After the direction indicator has been compensated, the installation shall be such that the deviation in level flight does not exceed 10 degrees on any heading. A suitable calibration placard shall be provided as specified in § 3.758.

§ 3.667 *Automatic pilot system.* If an automatic pilot system is installed:

(a) The actuating (servo) devices shall be of such design that they can, when necessary, be positively disengaged from operating the control system or be overpowered by the human pilot to enable him to maintain satisfactory control of the airplane.

(b) A satisfactory means shall be provided to indicate readily to the pilot the alignment of the actuating device in relation to the control system which it operates, except when automatic synchronization is provided.

(c) The manually operated control(s) for the system's operation shall be readily accessible to the pilot.

(d) The automatic pilot system shall be of such design and so adjusted that it cannot produce loads in the control system and surfaces greater than those for which they were designed.

§ 3.667-1 *Automatic pilots (CAA rules which apply to § 3.667).* See § 4b.705-1 of this chapter.

[13 F. R. 7725]

§ 3.668 *Gyroscopic indicators (air-driven type).* All air-driven gyroscopic instruments installed in airplanes which

are certificated for instrument flight operations shall derive their energy from a reliable suction source of sufficient capacity to maintain their required accuracy at all speeds above the best rate-of-climb speed. In addition the system shall be so installed as to preclude malfunctioning due to rain, oil, or other detrimental elements. On multiengine airplanes, the following detail requirements shall be applicable:

(a) Two sources actuated by separate means shall be provided, either one of which shall be of sufficient capacity to operate all of the air-driven gyroscopic instruments with which the airplane is equipped, with the airplane in normal cruising attitude at 65 percent maximum continuous power.

(b) A suitable means shall be provided in the attendant installation where the source lines connect into a common line to select either suction air source for the proper functioning of the instruments should failure of one source or a breakage of one source line occur. When an automatic means to permit simultaneous air flow is provided in the system, a suitable method for maintaining suction shall be provided. In order to indicate which source of energy has failed, a visual means shall be provided to indicate this condition to the flight crew.

§ 3.669 Suction gauge. A suction gauge shall be provided and so installed as to indicate readily to the flight crew while in flight the suction in inches of mercury which is being applied to the air-driven types of gyroscopic instruments. This gauge shall be connected to the instruments by a suitable system.

POWER-PLANT INSTRUMENTS

§ 3.670 Operational markings. Instruments shall be marked as specified in § 3.759.

§ 3.671 Instrument lines. Power-plant instrument lines shall comply with the provisions of § 3.550. In addition, instrument lines carrying inflammable fluids or gases under pressure shall be provided with restricted orifices or other safety devices at the source of the pressure to prevent escape of excessive fluid or gas in case of line failure.

§ 3.672 Fuel quantity indicator. Means shall be provided to indicate to the flight personnel the quantity of fuel in each tank during flight. Tanks, the outlets and air spaces of which are interconnected, may be considered as one tank and need not be provided with separate indicators. Exposed sight gauges shall be so installed and guarded as to preclude the possibility of breakage or damage. Fuel quantity indicators shall be calibrated to read zero during level flight when the quantity of fuel remaining in the tank is equal to the unusable fuel supply as defined by § 3.437.

[12 F. R. 3438]

§ 3.672-1 Means to indicate fuel quantity (CAA policies which apply to § 3.672). The Administrator will accept, as a "means to indicate to the flight personnel the quantity of fuel in each tank during flight," a fuel tank calibrated to read in either gallons or pounds, provid-

ing the gauge is clearly marked to indicate which scale is being used.

[12 F. R. 3438. Correction noted at 14 F. R. 36]

§ 3.673 Fuel flowmeter system. When a fuel flowmeter system is installed in the fuel line(s), the metering component shall be of such design as to include a suitable means for bypassing the fuel supply in the event that malfunctioning of the metering component offers a severe restriction to fuel flow.

§ 3.674 Oil quantity indicator. Ground means, such as a stick gauge, shall be provided to indicate the quantity of oil in each tank. If an oil transfer system or a reserve oil supply system is installed, means shall be provided to indicate to the flight personnel during flight the quantity of oil in each tank.

§ 3.675 Cylinder head temperature indicating system for air-cooled engines. A cylinder head temperature indicator shall be provided for each engine on airplanes equipped with cowl flaps. In the case of airplanes which do not have cowl flaps, an indicator shall be provided if compliance with the provisions of § 3.581 is demonstrated at a speed in excess of the speed of best rate of climb.

§ 3.676 Carburetor air temperature indicating system. A carburetor air temperature indicating system shall be provided for each altitude engine equipped with a preheater which is capable of providing a heat rise in excess of 60° F.

ELECTRICAL SYSTEMS AND EQUIPMENT

§ 3.681 Installation. (a) Electrical systems in airplanes shall be free from hazards in themselves, in their method of operation, and in their effects on other parts of the airplane. Electrical equipment shall be of a type and design adequate for the use intended. Electrical systems shall be installed in such a manner that they are suitably protected from fuel, oil, water, other detrimental substances, and mechanical damage.

(b) Items of electrical equipment required for a specific type of operation are listed in other pertinent parts of the Civil Air Regulations.

BATTERIES

§ 3.682 Batteries. When an item of electrical equipment which is essential to the safe operation of the airplane is installed, the battery required shall have sufficient capacity to supply the electrical power necessary for dependable operation of the connected electrical equipment.

§ 3.683 Protection against acid. If batteries are of such a type that corrosive substance may escape during servicing or flight, means such as a completely enclosed compartment shall be provided to prevent such substances from coming in contact with other parts of the airplane which are essential to safe operation. Batteries shall be accessible for servicing and inspection on the ground.

§ 3.684 Battery vents. The battery container or compartment shall be vented in such manner that gases released by

the battery are carried outside the airplane.

GENERATORS

§ 3.685 Generator. Generators shall be capable of delivering their continuous rated power.

§ 3.686 Generator controls. Generator voltage control equipment shall be capable of dependably regulating the generator output within rated limits.

§ 3.687 Reverse current cut-out. A generator reverse current cut-out shall disconnect the generator from the battery and other generators when the generator is developing a voltage of such value that current sufficient to cause malfunctioning can flow into the generator.

MASTER SWITCH

§ 3.688 Arrangement. If electrical equipment is installed, a master switch arrangement shall be provided which will disconnect all sources of electrical power from the main distribution system at a point adjacent to the power sources.

§ 3.689 Master switch installation. The master switch or its controls shall be so installed that it is easily discernible and accessible to a member of the crew in flight.

PROTECTIVE DEVICES

§ 3.690 Fuses or circuit breakers. If electrical equipment is installed, protective devices (fuses or circuit breakers) shall be installed in the circuits to all electrical equipment, except that such items need not be installed in the main circuits of starter motors or in other circuits where no hazard is presented by their omission.

§ 3.691 Protective devices installation. Protective devices in circuits essential to safety in flight shall be so located and identified that fuses may be replaced or circuit breakers reset readily in flight.

§ 3.692 Spare fuses. If fuses are used, one spare of each rating or 50 percent spare fuses of each rating, whichever is greater, shall be provided.

ELECTRIC CABLES

§ 3.693 Electric cables. If electrical equipment is installed, the connecting cables used shall be in accordance with recognized standards for electric cable of a slow burning type and of suitable capacity.

SWITCHES

§ 3.694 Switches. Switches shall be capable of carrying their rated current and shall be of such construction that there is sufficient distance or insulating material between current carrying parts and the housing so that vibration in flight will not cause shorting.

§ 3.695 Switch installation. Switches shall be so installed as to be readily accessible to the appropriate crew member and shall be suitably labeled as to operation and the circuit controlled.

INSTRUMENT LIGHTS

§ 3.696 Instrument lights. If instrument lights are required, they shall be of such construction that there is sufficient distance or insulating material between

current carrying parts and the housing so that vibration in flight will not cause shorting. They shall provide sufficient illumination to make all instruments and controls easily readable and discernible, respectively.

§ 3.697 *Instrument light installation.* Instrument lights shall be installed in such a manner that their direct rays are shielded from the pilot's eyes. Direct rays shall not be reflected from the windshield or other surfaces into the pilot's eyes.

LANDING LIGHTS

§ 3.698 *Landing lights.* If landing lights are installed, they shall be of an acceptable type.

§ 3.699 *Landing light installation.* Landing lights shall be so installed that there is no dangerous glare visible to the pilot and also so that the pilot is not seriously affected by halation. They shall be installed at such a location that they provide adequate illumination for night landing.

POSITION LIGHTS

§ 3.700 *Type.* If position lights are installed, they shall be of a type certificated in accordance with Part 15 of this chapter, or shall comply with the pertinent provisions of that part.

§ 3.701 *Forward position light installation.* Forward position lights shall be so installed that, with the airplane in normal flying position, the red light is displayed on the left side and the green light on the right side, each showing unbroken light between two vertical planes the dihedral angle of which is 100 degrees when measured to the left and right, respectively, of the airplane from dead ahead. The lights shall be spaced laterally as far apart as practicable.

§ 3.702 *Rear position light installation.* The rear position light shall be mounted as far aft as practicable and so installed that unbroken light is directed symmetrically aft in such a manner that the axis of the maximum cone of illumination is parallel to the flight path. In addition, the intersection of the two planes forming dihedral angle A given in Part 15 of this chapter shall be vertical.

§ 3.703 *Flashing rear position lights.* If red and white flashing lights are used, in addition to meeting the installation requirements in § 3.702, they shall be located close together.

ANCHOR LIGHTS

§ 3.704 *Anchor light.* When an anchor light is required for seaplanes and amphibians, at least one light shall be provided and it shall be capable of showing a white light for at least 2 miles at night under clear atmospheric conditions.

§ 3.705 *Anchor light installation.* Anchor lights shall be so installed that they will show the maximum unbroken light practicable when the airplane is moored or drifting on the water. Externally hung lights are permitted.

SAFETY EQUIPMENT; INSTALLATION

§ 3.711 *Marking.* Required safety equipment which the crew is expected to

operate at a time of emergency, such as flares and automatic life raft releases, shall be readily accessible and plainly marked as to its method of operation. When such equipment is carried in lockers, compartments, or other storage places, such storage places shall be marked for the benefit of passengers and crew.

§ 3.712 *De-icers.* When pneumatic de-icers are installed, the installation shall be in accordance with approved data. Positive means shall be provided for the deflation of the pneumatic boots.

§ 3.713 *Flare requirements.* When parachute flares are required, they shall be of a type certificated in accordance with Part 15 of this chapter.

§ 3.714 *Flare installation.* Parachute flares shall be releasable from the pilot compartment and so installed that danger of accidental discharge is reduced to a minimum. The installation shall be demonstrated in flight to eject flares satisfactorily, except in those cases where inspection indicates a ground test will be adequate. If the flares are ejected so that recoil loads are involved, structural provisions for such loads shall be made.

§ 3.715 *Safety belts.* Safety belts shall be of a type certificated in accordance with Part 15 of this chapter. They shall be so attached that no part of the anchorage will fail at a lower load than specified in § 3.386.

EMERGENCY FLOTATION AND SIGNALING EQUIPMENT

§ 3.716 *Rafts and life preservers.* An approved life raft or approved life preserver, when required by other parts of the Civil Air Regulations, is one approved by either the Administrator, the Bureau of Marine Inspection and Navigation, the United States Army Air Forces, or the Bureau of Aeronautics, Navy Department.

§ 3.716-1 *Life rafts and life preservers (CAA rules which apply to § 3.716).* See §§ 4b.811-1 and 4b.811-2 of this chapter.

[13 F. R. 7725]

§ 3.717 *Installation.* When such emergency equipment is required, it shall be so installed as to be readily available to the crew and passengers. Rafts released automatically or by the pilot shall be attached to the airplane by means of a line to keep them adjacent to the airplane. The strength of the line shall be such that it will break before submerging the empty raft.

§ 3.718 *Signaling device.* Signaling devices, when required by other parts of the Civil Air Regulations, shall be accessible, function satisfactorily, and be free from any hazard in their operation.

RADIO EQUIPMENT; INSTALLATION

§ 3.721 *General.* Radio equipment and installations in the airplane shall be free from hazards in themselves, in their method of operation, and in their effects on other components of the airplane.

MISCELLANEOUS EQUIPMENT; INSTALLATION

§ 3.725 *Accessories for multiengine airplanes.* Engine driven accessories es-

sential to the safe operation of the airplane shall be so distributed among two or more engines that the failure of any one engine will not impair the safe operation of the airplane by the malfunctioning of these accessories.

HYDRAULIC SYSTEMS

§ 3.726 *General.* Hydraulic systems and elements shall be so designed as to withstand, without exceeding the yield point, any structural loads which might be imposed in addition to the hydraulic loads.

§ 3.727 *Tests.* Hydraulic systems shall be substantiated by proof pressure tests. When proof tested, no part of the hydraulic system shall fail, malfunction, or experience a permanent set. The proof load of any system shall be 1.5 times the maximum operating pressure of that system.

§ 3.728 *Accumulators.* Hydraulic accumulators or pressurized reservoirs shall not be installed on the engine side of the fire wall, except when they form an integral part of the engine or propeller.

SUBPART G—OPERATING LIMITATIONS AND INFORMATION

§ 3.735 *General.* Means shall be provided to inform adequately the pilot and other appropriate crew members of all operating limitations upon which the type design is based. Any other information concerning the airplane found by the Administrator to be necessary for safety during its operation shall also be made available to the crew. (See §§ 3.755 and 3.777.)

LIMITATIONS

§ 3.737 *Limitations.* The operating limitations specified in §§ 3.738-3.750 and any similar limitations shall be established for any airplane and made available to the operator as further described in §§ 3.755-3.780, unless its design is such that they are unnecessary for safe operation.

AIR SPEED

§ 3.738 *Air speed.* Air-speed limitations shall be established as set forth in §§ 3.739-3.743.

§ 3.739 *Never-exceed speed (V_{ne}).* This speed shall not exceed the lesser of the following:

(a) 0.9 V_a chosen in accordance with § 3.184.

(b) 0.9 times the maximum speed demonstrated in accordance with § 3.159, but shall not be less than 0.9 times the minimum value of V_a permitted by § 3.184.

§ 3.740 *Maximum structural cruising speed (V_{no}).* This operating limitation shall be:

(a) Not greater than V_c chosen in accordance with § 3.184.

(b) Not greater than 0.89 times V_{ne} established under § 3.739.

(c) Not less than the minimum V_c permitted in § 3.184.

§ 3.741 *Maneuvering speed (V_p).* (See § 3.184.)

§ 3.742 *Flaps-extended speed (V_{fe})*. (a) This speed shall not exceed the lesser of the following:

(1) The design flap speed, V_f , chosen in accordance with § 3.190.

(2) The design flap speed chosen in accordance with § 3.223, but shall not be less than the minimum value of design flap speed permitted in §§ 3.190 and 3.223.

(b) Additional combinations of flap setting, air speed, and engine power may be established, provided the structure has been proven for the corresponding design conditions.

§ 3.743 *Minimum control speed (V_{mc})*. (See § 3.111.)

POWER PLANT

§ 3.744 *Power plant*. The power-plant limitations in §§ 3.745 through 3.747 shall be established and shall not exceed the corresponding limits established as a part of the type certification of the engine and propeller installed in the airplane.

§ 3.745 *Take-off operation*. (a) Maximum rotational speed (revolutions per minute).

(b) Maximum permissible manifold pressure (if applicable).

(c) The time limit upon the use of the corresponding power.

(d) Where the time limit of paragraph (c) of this section exceeds 2 minutes, the maximum allowable temperatures for cylinder head, oil, and coolant outlet if applicable.

§ 3.746 *Maximum continuous operation*. (a) Maximum rotational speed (revolutions per minute).

(b) Maximum permissible manifold pressure (if applicable).

(c) Maximum allowable temperatures for cylinder head, oil, and coolant outlet if applicable.

§ 3.747 *Fuel octane rating*. The minimum octane rating of fuel required for satisfactory operation of the power plant at the limits of §§ 3.745 and 3.746.

AIRPLANE WEIGHT

§ 3.748 *Airplane weight*. The airplane weight and center of gravity limitations are those required to be determined by § 3.71.

MINIMUM FLIGHT CREW

§ 3.749 *Minimum flight crew*. The minimum flight crew shall be established as that number of persons required for the safe operation of the airplane during any contact flight as determined by the availability and satisfactory operation of all necessary controls by each operator concerned.

TYPES OF OPERATION

§ 3.750 *Types of operation*. The type of operation to which the airplane is limited shall be established by the category in which it has been found eligible for certification and by the equipment installed. (See Parts 42 and 43 of this chapter.)

MARKINGS AND PLACARDS

§ 3.755 *Markings and placards*. (a) The markings and placards specified are

required for all airplanes. Placards shall be displayed in a conspicuous place and both shall be such that they cannot be easily erased, disfigured, or obscured. Additional informational placards and instrument markings having a direct and important bearing on safe operation may be required by the Administrator when unusual design, operating, or handling characteristics so warrant.

(b) When an airplane is certificated in more than one category, the applicant shall select one category on which all placards and markings on the airplane shall be based. The placard and marking information for the other categories in which the airplane is certificated shall be entered in the Airplane Flight Manual. A reference to this information shall be included on a placard which shall also indicate the category on which the airplane placards and markings are based.

INSTRUMENT MARKINGS

§ 3.756 *Instrument markings*. The instruments listed in §§ 3.757-3.761 shall have the following limitations marked thereon. When these markings are placed on the cover glass of the instrument, adequate provision shall be made to maintain the correct alignment of the glass cover with the face of the dial. All arcs and lines shall be of sufficient width and so located as to be clearly and easily visible to the pilot.

§ 3.757 *Air-speed indicator*. (a) True indicated air speed shall be used:

(1) The never-exceed speed, V_{ne} —a radial red line (see § 3.739).

(2) The caution range—a yellow arc extending from the red line in (1) above to the upper limit of the green arc specified in (3) below.

(3) The normal operating range—a green arc with the lower limit at V_{s1} , as determined in § 3.82, with maximum weight, landing gear and wing flaps retracted, and the upper limit at the maximum structural cruising speed established in § 3.740.

(4) The flap operating range—a white arc with the lower limit at V_{s0} as determined in § 3.82 at the maximum weight, and the upper limit at the flaps-extended speed in § 3.742.

(b) When the never-exceed and maximum structural cruising speeds vary with altitude, means shall be provided which will indicate the appropriate limitations to the pilot throughout the operating altitude range.

§ 3.758 *Magnetic direction indicator*. A placard shall be installed on or in close proximity to the magnetic direction indicator which contains the calibration of the instrument in a level flight attitude with engine(s) operating and radio receiver(s) on or off (which shall be stated). The calibration readings shall be those to known magnetic headings in not greater than 30-degree increments.

§ 3.759 *Power-plant instruments*. All required power-plant instruments shall be marked with a red radial line at the maximum and minimum (if applicable) indications for safe operation. The normal operating ranges shall be marked with a green arc which shall not

extend beyond the maximum and minimum limits for continuous operation. Take-off and precautionary ranges shall be marked with a yellow arc.

§ 3.760 *Oil quantity indicators*. Indicators shall be suitably marked in sufficient increments so that they will readily and accurately indicate the quantity of oil.

§ 3.761 *Fuel quantity indicator*. When the unusable fuel supply for any tank exceeds 1 gallon or 5 percent of the tank capacity, whichever is greater, a red band shall be placed on the indicator extending from the calibrated zero reading (see § 3.437) to the lowest reading obtainable in the level flight attitude, and a suitable notation in the Airplane Flight Manual shall be provided to indicate to the flight personnel that the fuel remaining in the tank when the quantity indicator reaches zero cannot be used safely in flight. (See § 3.672.)

CONTROL MARKINGS

§ 3.762 *General*. All cockpit controls, with the exception of the primary flight controls, shall be plainly marked as to their function and method of operation.

§ 3.763 *Aerodynamic controls*. The secondary controls shall be suitably marked to comply with §§ 3.337 and 3.338.

§ 3.764 *Power-plant fuel controls*. (a) Controls for fuel tank selector valves shall be marked to indicate the position corresponding to each tank and to all existing cross feed positions.

(b) When more than one fuel tank is provided, and if safe operation depends upon the use of tanks in a specific sequence, the fuel tank selector controls shall be marked adjacent to or on the control to indicate to the flight personnel the order in which the tanks must be used.

(c) On multiengine airplanes, controls for engine valves shall be marked to indicate the position corresponding to each engine.

(d) The capacity of each tank shall be indicated adjacent to or on the fuel tank selector control.

§ 3.765 *Accessory and auxiliary controls*. (a) When a retractable landing gear is used, the indicator required in § 3.359 shall be marked in such a manner that the pilot can ascertain at all times when the wheels are secured in the extreme positions.

(b) Emergency controls shall be colored red and clearly marked as to their method of operation.

MISCELLANEOUS

§ 3.766 *Baggage compartments, ballast location, and special seat loading limitations*. (a) Each baggage or cargo compartment and ballast location shall bear a placard which states the maximum allowable weight of contents and, if applicable, any special limitation of contents due to loading requirements, etc.

(b) When the maximum permissible weight to be carried in a seat is less than 170 pounds (see § 3.74), a placard shall be permanently attached to the seat structure which states the maximum

allowable weight of occupants to be carried.

§ 3.767 *Fuel, oil, and coolant filler openings.* The following information shall be marked on or adjacent to the filler cover in each case:

(a) The word "fuel," the minimum permissible fuel octane number for the engines installed, and the usable fuel tank capacity. (See § 3.437.)

(b) The word "oil" and the oil tank capacity.

(c) The name of the proper coolant fluid and the capacity of the coolant system.

§ 3.768 *Emergency exit placards.* Emergency exit placards and operating controls shall be colored red. A placard shall be located adjacent to the control(s) which clearly indicates it to be an emergency exit and describes the method of operation. (See § 3.387.)

§ 3.769 *Approved flight maneuvers—*(a) *Category N.* A placard shall be provided in front of and in clear view of the pilot stating: "No acrobatic maneuvers including spins approved."

(b) *Category U.* A placard shall be provided in front of and in clear view of the pilot stating: "No acrobatic maneuvers approved, except those listed in the Airplane Flight Manual."

(c) *Category A.* A placard shall be provided in clear view of the pilot which lists all approved acrobatic maneuvers and the recommended entry air speed for each. If inverted flight maneuvers are not approved, the placard shall bear a notation to this effect.

§ 3.770 *Airplane category placard.* A placard shall be provided in front of and in clear view of the pilot stating: "This airplane must be operated as a _____ or _____ category airplane in compliance with the Airplane Flight Manual."

AIRPLANE FLIGHT MANUAL

§ 3.777 *Airplane Flight Manual.* An Airplane Flight Manual shall be furnished with each airplane. The portions of this document listed below shall be verified and approved by the Administrator, and shall be segregated, identified, and clearly distinguished from portions not so approved. Additional items of information having a direct and important bearing on safe operation may be required by the Administrator when unusual design, operating, or handling characteristics so warrant.

§ 3.778 *Operating limitations—*(a) *Air-speed limitations.* Sufficient information shall be included to permit proper marking of the air-speed limitations on the indicator as required in § 3.757. It shall also include the design, maneuvering speed, and the maximum safe air speed at which the landing gear can be safely lowered. In addition to the above information, the significance of the air speed limitations and of the color coding used shall be explained.

(b) *Power-plant limitations.* Sufficient information shall be included to outline and explain all power-plant limitations (see § 3.744) and to permit marking the instruments as required in § 3.759.

(c) *Weight.* The following information shall be included:

(1) Maximum weight for which the airplane has been certificated,

(2) Airplane empty weight and center of gravity location,

(3) Useful load,

(4) The composition of the useful load, including the total weight of fuel and oil with tanks full.

(d) *Load distribution.* (1) All authorized center of gravity limits shall be stated. If the available space for loading the airplane is adequately placarded or so arranged that any reasonable distribution of the useful load listed in weight above will not result in a center of gravity location outside of the stated limits, this section need not include any other information than the statement of center of gravity limits.

(2) In all other cases this section shall also include adequate information to indicate satisfactory loading combinations which will assure maintaining the center of gravity position within approved limits.

(e) *Maneuvers.* All authorized maneuvers and the appropriate air-speed limitations as well as all unauthorized maneuvers shall be included in accordance with the following:

(1) *Normal category.* All acrobatic maneuvers, including spins, are unauthorized. If the airplane has been demonstrated to be characteristically incapable of spinning in accordance with § 3.124 (d), a statement to this effect shall be entered here.

(2) *Utility category.* All authorized maneuvers demonstrated in the type flight tests shall be listed, together with recommended entry speeds. All other maneuvers are not approved. If the airplane has been demonstrated to be characteristically incapable of spinning in accordance with § 3.124 (d), a statement to this effect shall be entered here.

(3) *Acrobatic category.* All approved flight maneuvers demonstrated in the type flight tests shall be included, together with recommended entry speeds.

(f) *Flight load factor.* The positive limit load factors made good by the airplane's structure shall be described here in terms of accelerations.

(g) *Flight crew.* When a flight crew of more than one is required to operate the airplane safely, the number and functions of the minimum flight crew shall be included.

§ 3.779 *Operating procedures.* This section shall contain information concerning normal and emergency procedures and other pertinent information peculiar to the airplane's operating characteristics which are necessary to safe operation.

§ 3.780 *Performance information.* (a) Information relative to the following items of performance shall be included:

(1) The stalling speed, V_{SO} , at maximum weight,

(2) The stalling speed, V_{SI} , at maximum weight and with landing gear and wing flaps retracted,

(3) The take-off distance determined in accordance with § 3.84, including the air speed at the 50-foot height, and the airplane configuration, if pertinent,

(4) The landing distance determined in accordance with § 3.86, including the airplane configuration, if pertinent,

(5) The steady rate of climb determined in accordance with § 3.85 (a), (c), and, as appropriate, (b), including the air speed, power, and airplane configuration, if pertinent.

(b) The effect of variation in (a) (2) with angle of bank up to 60 degrees shall be included.

(c) The calculated approximate effect of variations in subparagraphs (3), (4) and (5) of this paragraph with altitude and temperature shall be included.

§ 3.780-1 *Calculated effects of temperature and altitude variations* (CAA policies which apply to § 3.780). Section 3.780 requires that the calculated effects of variations in temperature and altitude on the take-off distance (§ 3.84 (a) (2)), the landing distance (§ 3.86), and the steady rate of climb (§ 3.85 (a), (b), and (c)), shall be included in the Airplane Flight Manual. The following ranges of these variables will be considered acceptable by the Administrator:

(a) The altitudes and temperatures for which performance in take-off distance, landing distance, take-off climb and balked landing climb shall be calculated are sea level to 7,000 feet and 0° F. to 100° F. respectively, except that take-off and landing distances for a seaplane need not show temperatures below 30° F. at altitudes above 1,000 feet.

(b) For multiengine aircraft, the climb with the critical engine inoperative shall be calculated for an altitude range of sea level to absolute ceiling and a temperature range from 60° F. below the standard temperature to 40° F. above the standard temperature at the altitude involved.

[12 F. R. 3438. Correction noted at 14 F. R. 36]

SUBPART H—IDENTIFICATION DATA

§ 3.791 *Name plate.* A name plate shall be securely attached to and located in the pilot compartment which shall contain:

(a) The manufacturer's name and address.

(b) Model and serial numbers.

(c) Date of manufacture.

(d) Type certificate number.

(e) Production certificate number, (if pertinent).

§ 3.792 *Airworthiness certificate number.* The identifying symbols and registration numbers shall be permanently affixed to the airplane structure in compliance with § 43.10 (c) of this chapter.

PART 4a—AIRPLANE AIRWORTHINESS

SUBPART A—AIRWORTHINESS REQUIREMENTS

GENERAL

Sec.	Scope.
4a.1	Airplane categories.
4a.2	

AIRWORTHINESS AND TYPE CERTIFICATES

4a.15	Requirements for issuance.
4a.16	Data required for airworthiness certificate.
4a.17	Data required for type certificate.
4a.18	Inspection and tests.
4a.19	Flight tests.
4a.20	Procedure for type certification.

CHANGES

- Sec.
4a.25 Continued compliance.
4a.26 Minor changes.
4a.27 Major changes.
4a.28 Changes required by the Administrator.

APPROVAL OF MATERIALS, PARTS, PROCESSES, AND APPLIANCES

- 4a.31 Specifications.

SUBPART B—DEFINITIONS

- 4a.37 Weights.
4a.38 Structural terms.
4a.39 Air density, ρ .
4a.40 Speed.
4a.41 Design gust velocity, U .
4a.42 Dynamic pressure, q .
4a.43 Load factors.
4a.44 Aerodynamic coefficients, C_L , C_M , C_P , etc.
4a.45 Standard atmosphere (standard air).
4a.46 Primary structure.

SUBPART C—STRUCTURAL LOADING CONDITIONS

GENERAL STRUCTURAL REQUIREMENTS

- 4a.61 Strength.
4a.62 Deformations.
4a.63 Stiffness.
4a.64 Proof of strength and rigidity.
4a.65 Materials, fabrication, protection, etc.

FLIGHT LOADS

- 4a.72 General.

AIR SPEEDS

- 4a.73 Air speeds.

LOAD FACTORS

- 4a.74 General.
4a.75 Maneuvering load factors.
4a.76 Gust load factors.
4a.77 Factors of safety.

SYMMETRICAL FLIGHT CONDITIONS (FLAPS RETRACTED)

- 4a.78 General.
4a.79 Condition I (positive high angle of attack).
4a.80 Condition I₁ (positive high angle of attack modified).
4a.81 Condition II (negative high angle of attack).
4a.82 Condition III.
4a.83 Condition IV (negative low angle of attack).
4a.84 Condition V (inverted flight).
4a.85 Condition VI (gilding).

SYMMETRICAL FLIGHT CONDITIONS (FLAPS OR AUXILIARY DEVICES IN OPERATION)

- 4a.86 General.
4a.87 Condition VII (positive gust, flaps deflected).
4a.88 Condition VIII (negative gust, flaps deflected).
4a.89 Condition IX (dive, flaps deflected).

UNSYMMETRICAL FLIGHT CONDITIONS

- 4a.90 General.
4a.91 Condition I_u.
4a.92 Condition III_u.
4a.93 Condition V_u.

SPECIAL FLIGHT CONDITIONS

- 4a.94 Gust at reduced weight.
4a.95 Lift-wire-cut.
4a.96 Drag-wire-cut.
4a.97 Unsymmetrical propeller thrust.
4a.98 Wing tanks empty.

WING LOAD DISTRIBUTION

- 4a.99 Wing load distribution.

CONTROL SURFACE LOADS

- 4a.115 General.

HORIZONTAL TAIL SURFACES

- Sec.
4a.116 Balancing.
4a.117 Maneuvering (horizontal surfaces).
4a.118 Damping (horizontal surfaces).
4a.119 Tab effects (horizontal surfaces).

VERTICAL TAIL SURFACES

- 4a.120 Maneuvering.
4a.121 Damping (vertical surfaces).
4a.122 Gusts (vertical surfaces).
4a.123 Tab effects (vertical surfaces).
4a.124 Special cases (vertical surfaces).

AILERONS

- 4a.125 Maneuvering.
4a.126 Tab effects (ailerons).
4a.127 Flying conditions (ailerons).

WING FLAPS AND TABS

- 4a.128 Wing flaps.
4a.129 Tabs.

SPECIAL DEVICES

- 4a.130 Special devices.

CONTROL SYSTEM LOADS

- 4a.137 General.
4a.138 Control wires or push rods.
4a.139 Elevator systems.
4a.140 Rudder systems.
4a.141 Aileron systems.
4a.142 Flap and tab control systems.

GROUND LOADS

- 4a.147 General.
4a.148 Level landing.
4a.151 Three-point landing.
4a.152 Energy absorption.
4a.153 Side load.
4a.154 One-wheel landing.
4a.155 Braked landing.
4a.156 Side loads on tail wheel or skid.

WATER LOADS

- 4a.161 General.

FLOAT SEAPLANES

- 4a.162 Landing with inclined reactions (float seaplanes).
4a.163 Float attachment members.
4a.164 Landing with vertical reactions (float seaplanes).
4a.165 Safety factors.
4a.166 Landing with side load (float seaplanes).

BOAT SEAPLANES

- 4a.167 Local bottom pressures.
4a.168 Distributed bottom pressures.
4a.169 Step loading condition.
4a.170 Bow loading condition.
4a.171 Stern loading condition.
4a.172 Side loading condition.

SEAPLANE FLOAT LOADS

- 4a.173 Seaplane float loads.
4a.174 Seaplane float bottom loads.

WING-TIP FLOAT LOADS

- 4a.175 Wing-tip float loads.
4a.176 Wing structure.

MISCELLANEOUS WATER LOADS

- 4a.177 Sea wing loads.

SPECIAL LOADING CONDITIONS

- 4a.187 Engine torque.
4a.188 High angle of attack and torque.
4a.189 Engine mounts, nacelles, etc.
4a.190 Side load on engine mount.
4a.191 Up load on engine mount.
4a.192 Passenger loads.
4a.193 Structures with safety belts.
4a.194 Local loads.
4a.195 Rigging loads.
4a.196 Air loads on struts.

MULTIPLYING FACTORS OF SAFETY

- Sec.
4a.207 General.
4a.208 Fittings.
4a.209 Castings.
4a.210 Parallel double wires.
4a.211 Wires at small angles.
4a.212 Double drag trusses.
4a.213 Torque tubes used as hinges.
4a.214 Control surface hinges and control system joints.
4a.215 Wire sizes.
4a.216 Wing lift truss system.

SUBPART D—PROOF OF STRUCTURE

- 4a.227 General.
4a.228 Proof of structural analysis.
4a.229 Combined structural analysis and tests.
4a.230 Load tests.
4a.231 Flight load tests.
4a.232 Load tests required.

WINGS

- 4a.237 Proof of wings.
4a.238 Redundancies.

BEAMS

- 4a.239 Beams.
4a.240 Secondary bending.
4a.241 Lateral buckling.
4a.242 Webs.
4a.243 Axial load.
4a.244 Joint slippage in wood beams.
4a.245 Bolt holes.
4a.246 Box beams.

DRAG TRUSSES

- 4a.247 Drag trusses.

RIBS

- 4a.248 Ribs.
4a.249 Load distribution.
4a.250 Ailerons and high-lift devices.
4a.251 Rib tests.

COVERING

- 4a.252 Covering.
4a.252-1 Aircraft fabric (CAA rules which apply to § 4a.252).

NONPARALLEL WIRES

- 4a.253 Nonparallel wires.

TAIL AND CONTROL SURFACES

- 4a.263 Proof of tail and control surfaces.
4a.264 Vibration tests.

CONTROL SYSTEMS

- 4a.269 Proof of control systems.
4a.270 Control system tests.
4a.271 Operation test.
4a.272 Control system joints.

LANDING GEAR

- 4a.277 Proof of landing gear.
4a.278 Energy absorption tests.

HULLS AND FLOATS

- 4a.283 Proof of hulls and floats.

FUSELAGES AND ENGINE MOUNTS

- 4a.289 Proof of fuselages and engine mounts.
4a.290 Critical column loads.
4a.291 Baggage compartments.

FITTINGS AND PARTS

- 4a.297 Proof of fittings and parts.
4a.298 Fittings and attaching members.
4a.299 Bolts.

SUBPART E—DETAIL DESIGN AND CONSTRUCTION

- 4a.301 General.
4a.301-1 Combustion heaters (CAA rules which apply to § 4a.301).

MATERIALS, WORKMANSHIP, AND FABRICATION METHODS

- 4a.302 Materials and workmanship.
4a.303 Fabrication methods.
4a.304 Gluing.

Sec.

- 4a.305 Torch welding.
- 4a.306 Electric welding.
- 4a.307 Brazing and soldering.
- 4a.308 Protection.
- 4a.309 Inspection.

JOINTS, FITTINGS, AND CONNECTING PARTS

- 4a.312 Joints, fittings, and connecting parts.
- 4a.313 Bolts, pins, and screws.
- 4a.314 Wood screws.
- 4a.315 Eyebolts.
- 4a.316 Castings.

TIE-RODS AND WIRES

- 4a.319 Tie-rods and wires.
- 4a.320 Wire terminals.
- 4a.321 Wire anchorages.
- 4a.322 Counter wire sizes.

FLUTTER PREVENTION

- 4a.326 General flutter prevention measures.

DETAIL DESIGN OF WINGS

- 4a.329 External bracing.
- 4a.330 Wire-braced monoplanes.
- 4a.331 Lift trusses.
- 4a.332 Jury struts.
- 4a.333 Wing beams.
- 4a.334 Wing beam joints.
- 4a.335 Drag truss.
- 4a.336 Aileron and flap attachments.
- 4a.337 Internally braced biplanes.
- 4a.338 Fabric covering.
- 4a.338-1 Aircraft fabric (CAA rules which apply to § 4a.338).
- 4a.339 Metal-covered wings.

DETAIL DESIGN OF TAIL AND CONTROL SURFACES

- 4a.445 Installation.
- 4a.446 Stops.
- 4a.447 Elevator trailing edge tab systems.
- 4a.448 Hinges.
- 4a.449 Elevators.
- 4a.450 Dynamic and static balance.
- 4a.451 Wing flaps.
- 4a.452 Tabs.

DETAIL DESIGN OF CONTROL SYSTEMS

- 4a.459 Installation.
- 4a.460 Stops.
- 4a.461 Joints.
- 4a.462 Welds.
- 4a.463 Flap controls.
- 4a.464-T Flap controls.
- 4a.465 Tab controls.
- 4a.466 Spring devices.
- 4a.467 Single-cable controls.
- 4a.468 Control system locks.
- 4a.469-T Trim controls.

DETAIL DESIGN OF LANDING GEAR

- 4a.475 Shock absorption.
- 4a.476 Shock-absorbing systems.
- 4a.477 Wheels.
- 4a.478 Main landing gear wheels.
- 4a.479 Tail and nose wheels.
- 4a.480 Tires.
- 4a.481 Tire markings.
- 4a.482 Retracting mechanism.
- 4a.483-T Brakes.

HULLS AND FLOATS

- 4a.488 Hulls and floats.
- 4a.489 Buoyancy (main seaplane floats).
- 4a.490 Buoyancy (boat seaplanes).
- 4a.491 Water stability.
- 4a.492 Float design.

FUSELAGE AND CABINS

- 4a.497 Provision for turn-over.
- 4a.498 External door.
- 4a.499 Location of passenger door.
- 4a.500 Exits.

PILOT COMPARTMENT

- 4a.501 Construction.
- 4a.502 Location.
- 4a.503 Identification plate.

Sec.

- 4a.504 Operation information and limitations.
- 4a.505 Windows and windshields.
- 4a.506 Leakage.
- 4a.507 Seats.
- 4a.508 Navigation instruments.
- 4a.509 Opening between pilot compartment and passengers' cabin.

PASSENGER AND BAGGAGE COMPARTMENTS

- 4a.510 Passenger compartments.
- 4a.511 Passenger chairs.
- 4a.512 Baggage compartments.

REINFORCEMENT NEAR PROPELLERS

- 4a.513 Reinforcement near propellers.

SUBPART F—EQUIPMENT

- 4a.523 General.
- 4a.524 Requirements.
- 4a.525 Life preserver or flotation device.
- 4a.525-1 Life rafts and life preservers (CAA rules which apply to § 4a.525).
- 4a.526 Fire extinguishing apparatus.

NON-AIR CARRIER (NAC) AIRPLANES

- 4a.531 Non-air carrier (NAC) airplanes.
- 4a.532 NAC landplanes; visual contact day flying (within 100 miles of a fixed base).
- 4a.532-1 Portable water-solution type fire extinguishers (CAA rules which apply to § 4a.532 (j)).
- 4a.533 NAC landplanes; visual contact day flying (unlimited distance).
- 4a.534 NAC landplanes; visual contact night flying.
- 4a.535 NAC landplanes; instrument day flying.
- 4a.535-1 Airspeed indicators, turn-and-bank indicators, direction indicators, climb indicators, and altimeters (CAA rules which apply to § 4a.531).
- 4a.536 NAC landplanes; instrument night flying.
- 4a.537 NAC seaplanes and amphibians.
- 4a.537-1 Life rafts and life preservers (CAA rules which apply to § 4a.537).

AIR CARRIER AIRPLANES; PASSENGER (ACP)

- 4a.547 Air carrier airplanes; passengers (ACP).
- 4a.548 ACP landplanes; visual contact day flying.
- 4a.549 ACP landplanes; visual contact night flying.
- 4a.550 ACP landplanes; instrument day flying.
- 4a.550-1 Air-speed indicators, turn-and-bank indicators, bank-and-pitch indicators, direction indicators, climb indicators, altimeters, and air-speed tubes (CAA rules which apply to § 4a.550).
- 4a.551 ACP landplanes; instrument night flying.
- 4a.552 ACP seaplanes and amphibians.

INSTALLATION REQUIREMENTS

- 4a.557 Installation requirements.

INSTRUMENT INSTALLATION

- 4a.558 Instruments.
- 4a.559 Air-speed indicator.
- 4a.560 Power-plant instruments and controls.
- 4a.561 Fuel quantity gauge.
- 4a.562 Magnetic compass.
- 4a.563 Navigation instruments.
- 4a.564 Gyroscopic instruments.

SAFETY EQUIPMENT INSTALLATION

- 4a.565 Safety belts.
- 4a.566 Fire extinguishers.
- 4a.567 Safety belt signal.
- 4a.568 Landing flares.
- 4a.569 De-icers.

ELECTRICAL EQUIPMENT INSTALLATION

Sec.

- 4a.570 General.
- 4a.571 Battery.
- 4a.572 Fuses.
- 4a.573 Generator.
- 4a.574 Running load.
- 4a.575 Anchor lights.
- 4a.576 Landing lights.
- 4a.577 Instrument lights.
- 4a.578 Position lights.
- 4a.578-1 Position light flashers (CAA rules which apply to § 4a.578).
- 4a.579 Master switch.

MISCELLANEOUS EQUIPMENT INSTALLATION

- 4a.580 Seats.
- 4a.581 Accessories.

SUBPART G—POWER-PLANT INSTALLATION

ENGINES

- 4a.591 Engines.

PROPELLERS

- 4a.597 Propellers.
- 4a.598 Controllable pitch.
- 4a.599 Propeller clearance.

FUEL SYSTEMS

- 4a.605 Capacity and feed.
- 4a.606 Tank installation.
- 4a.607 Tank construction.
- 4a.608 Tank strength.
- 4a.609 Gauge.
- 4a.610 Lines and fittings.
- 4a.611 Strainers.
- 4a.612 Valves.
- 4a.613 Dump valves.
- 4a.614 Drains.

MISCELLANEOUS FUEL SYSTEM REQUIREMENTS

- 4a.615 Filler openings.
- 4a.616 Prevention of ice formation.

LUBRICATION SYSTEMS

- 4a.621 General.
- 4a.622 Tank installation.
- 4a.623 Tank strength.
- 4a.624 Gauge.
- 4a.625 Piping.
- 4a.626 Drains.
- 4a.627 Oil temperature.
- 4a.628 Filler openings.

COOLING SYSTEMS

- 4a.633 General.
- 4a.634 Radiators.
- 4a.635 Piping.
- 4a.636 Drains.
- 4a.637 Filler openings.

POWER-PLANT INSTRUMENTS, CONTROLS, AND ACCESSORIES

- 4a.642 Instruments.
- 4a.643 Controls.
- 4a.644 Throttle controls.
- 4a.645 Ignition switches.
- 4a.646 Propeller pitch controls.
- 4a.647 Accessories (air-line carriers).

MANIFOLDING, COWLING, AND FIRE WALL

- 4a.651 General.
- 4a.652 Manifolds.
- 4a.653 Air intakes.
- 4a.654 Engine cowlings.
- 4a.655 Fire wall.
- 4a.656 Heating systems.

MISCELLANEOUS POWER-PLANT REQUIREMENTS

- 4a.661 Materials.

SUBPART H—PERFORMANCE

- 4a.671 Performance requirements.
- 4a.672 Landing speeds.
- 4a.673 Take-off.
- 4a.674 Climb.
- 4a.675 Controllability and maneuverability.
- 4a.676 Controllability at the stall.
- 4a.677 Balance.

Sec.	
4a.678	Stability.
4a.679	Spinning.
4a.680	Flutter and vibration.
4a.681-T	Flutter and vibration.
4a.682	Ground and water characteristics.

MODIFIED PERFORMANCE REQUIREMENTS

- 4a.687 Modified performance requirements for multiengine airplanes not certificated in the transport category.

PERFORMANCE TESTS

- 4a.701 General.
 4a.702 Flight test pilot.
 4a.703 Parachutes.
 4a.704 Reports.
 4a.705 Loading conditions.
 4a.706 Use of ballast.
 4a.707 Fuel to be carried.
 4a.708 Maximum air speed.
 4a.709 One-engine-inoperative performance.
 4a.710 Air-speed indicator calibration.
 4a.711 Check of fuel system.

AIR CARRIER AIRCRAFT PERFORMANCE CHARACTERISTICS

- 4a.717 Performance characteristics of air carrier aircraft.

OPERATION LIMITATIONS

- 4a.723 Weight.
 4a.724 Provisional weight (air-line carriers).
 4a.725 Center of gravity limitations.
 4a.726 Air-speed limitations.
 4a.727 Power-plant limitations.

TRANSPORT CATEGORY AIRPLANE PERFORMANCE REQUIREMENTS

- 4a.737-T Performance requirements for transport category airplanes.
 4a.738-T Minimum requirements for certification.

DEFINITIONS

- 4a.739-T Stalling speeds.
 4a.740-T Flap positions.
 4a.741-T Maximum one-engine-inoperative operating altitude.

WEIGHTS

- 4a.742-T Weights.
 4a.743-T Fuel dumping provisions.

PERFORMANCE REQUIREMENTS AND DETERMINATION

- 4a.744-T Required performance and performance determinations.
 4a.745-T Stalling speed requirements.
 4a.746-T Climb requirements.
 4a.747-T Take-off determination.

SUBPART I—MISCELLANEOUS REQUIREMENTS

- 4a.771 Standard weights.
 4a.772 Leveling means.

AUTHORITY: §§ 4a.1 to 4a.772 issued under sec. 205 (a), 52 Stat. 984; 49 U. S. C. 425 (a). Interpret or apply secs. 601, 603, 52 Stat. 1007, 1009; 49 U. S. C. 551, 553.

SUBPART A—AIRWORTHINESS REQUIREMENTS

SOURCE: §§ 4a.1 to 4a.31 contained in Amendment 48, Civil Air Regulations, 5 F. R. 1834, as amended by Amendment 75, 5 F. R. 8946, except as noted following sections affected.

GENERAL

§ 4a.1 *Scope.* The airworthiness requirements set forth in this part shall be used as a basis for obtaining airworthiness or type certificates: *Provided*, That: (a) Deviations from the requirements of this part which, in the opinion of the Administrator, insure the equivalent condition for safe operation and, (b) equivalent requirements of the United States Army or Navy with respect to airworthiness may be accepted in lieu of the requirements set forth in this part. Unless otherwise specified an amendment to this part will apply only to airplanes for which applications for type certificates are received subsequent to the effective date of such amendment.

§ 4a.2 *Airplane categories.* (a) At the election of the applicant, an airplane may be certificated under the requirements for a particular category according to the intended use of the airplane. Sections of this part which affect only one particular category are designated by a suffix added to the appropriate section numbers, as follows:

Normal category----- Suffix N
 Transport category----- Suffix T
 Acrobatic category----- Suffix A

(b) All sections not designated by a suffix are applicable to all categories, except as otherwise specified.

[Amdt. 04-3, 7 F. R. 984]

AIRWORTHINESS AND TYPE CERTIFICATES

§ 4a.15 *Requirements for issuance.* The airworthiness requirements specified in this part shall be used as a basis for the certification of airplanes: *Provided*, That an airplane manufactured in accordance with, and conforming to, the currently effective aircraft specifications issued therefor will be eligible for an airworthiness certificate, if the Administrator determines such airplane is in condition for safe operation: *Provided, further*, That an airplane which has not demonstrated compliance with the airworthiness requirements specified in this part but which, in the opinion of the Administrator, is in condition for safe operation for experimental purposes or for particular activities will be eligible for an airworthiness certificate.

§ 4a.16 *Data required for airworthiness certificate.* When an airworthiness certificate is sought and a type certificate is not involved, data which are adequate to establish compliance of the aircraft with the requirements listed in this part shall be submitted to the Administrator.

§ 4a.17 *Data required for type certificate.* Data which are adequate to establish compliance of the aircraft with the airworthiness requirements listed in this part and which are adequate for the reproduction of other airplanes of the same type shall be submitted to the Administrator. The procedure for submitting the required data, the technical contents

of such data, and the methods of testing aircraft with respect to the prescribed airworthiness requirements shall be in accordance with Civil Aeronautics Manual 4, Airplane Airworthiness.

§ 4a.18 *Inspection and tests.* Authorized representatives of the Administrator shall have access to the airplane and may witness or conduct such inspections and tests as are deemed necessary by the Administrator.

[Amdt. 48, 5 F. R. 1834, as amended by Amdt. 04a-6, 12 F. R. 1029]

§ 4a.19 *Flight tests.* (Applicable to all airplanes certificated as a type on or after May 15, 1947.) After proof of compliance with the structural requirements contained in this part, and upon completion of all necessary inspection and testing on the ground, and proof of the conformity of the airplane with the type design, and upon receipt from the applicant of a report of flight tests conducted by him, there shall be conducted such official flight tests as the Administrator finds necessary to determine compliance with Subparts C-G. After the conclusion of these flight tests such additional flight tests shall be conducted as the Administrator finds necessary to ascertain whether there is reasonable assurance that the airplane, its components, and equipment are reliable and function properly. The extent of such additional flight tests shall depend upon the complexity of the airplane, the number and nature of new design features, and the record of previous tests and experience for the particular airplane model, its components, and equipment. If practicable, the flight tests performed for the purpose of ascertaining the reliability and proper functioning shall be conducted on the same airplane which was used in flight tests to show compliance with Subparts C-G.

[Amdt. 04a-6, 12 F. R. 1029, as amended by Amdt. 04a-7, 12 F. R. 2087]

§ 4a.20 *Procedure for type certification.* Acceptable procedures for type certification are outlined in Civil Aeronautics Manual 4.

CHANGES

§ 4a.25 *Continued compliance.* Changes to certificated aircraft shall be substantiated to demonstrate continued compliance of the aircraft with the pertinent airworthiness requirements.

§ 4a.26 *Minor changes.* Minor changes to airplanes being manufactured under the terms of a type certificate and which obviously do not impair the condition of the airplane for safe operation may be approved by authorized representatives of the Administrator prior to submittal to the Administrator of any required revised drawings. The approval of such minor changes shall be based on the airworthiness requirements in effect when the particular airplane model was originally certificated, unless, in the opinion of the Administrator, compliance with current airworthiness requirements is necessary.

§ 4a.27 *Major changes.* Major changes to airplanes being manufactured under the terms of a type certificate may

require the issuance of a new type certificate and the Administrator may, in his discretion, require such changes to comply with current airworthiness requirements.

§ 4a.28 Changes required by the Administrator. (a) In the case of aircraft models approved under the airworthiness requirements in effect prior to the currently effective regulations, the Administrator may require that aircraft submitted for original airworthiness certification comply with such portions of the currently effective regulations as are considered necessary.

(b) All aircraft certificated under the transport category, the manufacture of which is completed after September 30, 1947, shall comply with the following sections of Part 4b of this subchapter, as amended: §§ 4b.58, 4b.442, 4b.445, 4b.447, 4b.449, 4b.450, 4b.478, 4b.484, 4b.503 (c), 4b.516-4b.518, 4b.556, 4b.557, 4b.560, 4b.561, 4b.586, 4b.621-4b.624, 4b.651-4b.655, 4b.661 and 4b.662-4b.676.

[Amdt. 48, 5 F. R. 1834, as amended by Amdt. 04-4, 11 F. R. 11353, Amdt. 04a-8, 12 F. R. 5959]

APPROVAL OF MATERIALS, PARTS, PROCESSES, AND APPLIANCES

§ 4a.31 Specifications. (a) Materials, parts, processes, and appliances shall be approved upon a basis and in a manner found necessary by the Administrator to implement the pertinent provisions of the Civil Air Regulations. The Administrator may adopt and publish such specifications as he finds necessary to administer this section, and shall incorporate therein such portions of the aviation industry, Federal, and military specifications respecting such materials, parts, processes, and appliances as he finds appropriate.

(b) Any material, part, process, or appliance shall be deemed to have met the requirements for approval when it meets the pertinent specifications adopted by the Administrator, and the manufacturer so certifies in a manner prescribed by the Administrator.

[Amdt. 04a-1, 12 F. R. 7898]

SUBPART B—DEFINITIONS

SOURCE: §§ 4a.37 to 4a.46 contained in Civil Air Regulations, May 31, 1938, as amended by Amendment 75, 5 F. R. 3946, except as noted following sections affected.

§ 4a.37 Weights—(a) Weight, W . The total weight of the airplane and its contents.

(b) **Design weight.** The weight of the airplane assumed for purposes of showing compliance with the structural requirements specified in this part.

(c) **Minimum design weight.** Weight empty with standard equipment, plus crew, plus fuel of 0.25 pound per maximum (except take-off) horsepower, plus oil as per capacity.

(d) **Standard weight.** The maximum weight for which the airplane is certificated as complying with all the airworthiness requirements for normal operations.

(e) **Provisional weight.** The maximum weight for which the airplane is certificated as complying with the airworthiness requirements as modified for scheduled air carriers in §§ 4a.687-4a.692.

§ 4a.38 Structural terms—(a) Design wing area, S . The area enclosed by the projection of the wing outline, including allons and flaps but ignoring fairings and fillets, on a surface containing the wing chords. The outline is assumed to extend through nacelles and through the fuselage to the plane of symmetry.

(b) **Design power, P .** The total engine horsepower chosen for use in determining the maneuvering load factors. The corresponding engine output will be incorporated in the aircraft certificate as a maximum operational limitation in all flight operations other than take-off or climbing flight (see § 4a.727).

(c) **Design wing loading, W/S .** The design weight (§ 4a.37 (b)) divided by the design wing area (§ 4a.38 (a)).

(d) **Design power loading, W/P .** The design weight (§ 4a.37 (b)) divided by the design power (see § 4a.38 (b) and Fig. 4a-3).

[CAR, May 31, 1938, as amended by Amdt. 5, 4 F. R. 1171]

§ 4a.39 Air density, ρ . The mass density of the air through which the airplane is moving, in terms of the weight of a unit volume of air divided by the acceleration of gravity. The symbol ρ_0 denotes the mass density of air at sea level under standard atmospheric conditions and has the value of 0.002378 slugs per cubic foot.

CROSS REFERENCE: For definition of standard atmosphere, see § 4a.45.

§ 4a.40 Speed—(a) True air speed, V_t . The velocity of the airplane, along its flight path, with respect to the body of air through which the airplane is moving.

(b) **Indicated air speed, V_i .** The true air speed multiplied by the term $\sqrt{\rho/\rho_0}$. (See § 4a.39.)

(c) **Design level speed, V_L .** The indicated air speed chosen for use in determining the pertinent structural loading conditions. This value will be incorporated in the aircraft certificate as a maximum operational limitation in level and climbing flight (see § 4a.726).

(d) **Design gliding speed, V_g .** The maximum indicated air speed to be used in determining the pertinent structural loading conditions (see §§ 4a.73 and 4a.726).

(e) **Design stalling speed, V_s .** The computed indicated air speed in unaccelerated flight based on the maximum lift coefficient of the wing and the design gross weight. The effects of slipstreams and nacelles shall be neglected in computing V_s . When high-lift devices are in operation the corresponding stalling speed will be denoted by V_{s1} .

(f) **Design flap speed, V_f .** The indicated air speed at which maximum operation of high-lift devices is assumed (see §§ 4a.73 and 4a.726).

(g) **Maximum vertical speed, V_m .** A fictitious value of indicated air speed computed for unaccelerated flight in a vertical dive with zero propeller thrust.

(h) **Design maneuvering speed, V_p .** The indicated air speed at which maximum operation of the control surfaces is assumed (see § 4a.73).

[CAR, May 31, 1938, as amended by Amdt. 5, 4 F. R. 1171]

§ 4a.41 Design gust velocity, U . A specific gust velocity assumed to act normal to the flight path. (See § 4a.76.)

§ 4a.42 Dynamic pressure, q . The kinetic energy of a unit volume of air.

$$q = \frac{1}{2} \rho V^2 \text{ (in terms of true air speed),}$$

$$= \frac{1}{2} \rho_0 V_i^2 \text{ (in terms of indicated air speed),}$$

$$= V^2/391 \text{ pounds per square foot, when } V$$

is miles per hour indicated air speed.

CROSS REFERENCE: For definition of ρ , see § 4a.39.

§ 4a.43 Load factors—(a) Load factor or acceleration factor, n . The ratio of a load to the design weight. When the load in question represents the net external load acting on the airplane in a given direction, n represents the acceleration factor in that direction.

(b) **Limit load.** A load (or load factor, or pressure) which it is assumed or known may be safely experienced but will not be exceeded in operation.

(c) **Factor of safety, f .** A factor by which the limit loads are multiplied for various design purposes.

(d) **Ultimate factor of safety, f_u .** A specified factor of safety used in determining the maximum load which the airplane structure is required to support.

(e) **Yield factor of safety, f_y .** A specified factor of safety used in connection with the prevention of permanent deformations.

(f) **Ultimate load.** A limit load multiplied by the specified ultimate factor (or factors) of safety. (See definitions in this section and § 4a.61.)

(g) **Yield load.** A limit load multiplied by the specified yield factor (or factors) of safety. (See definitions in this section and § 4a.62.)

(h) **Strength test.** A static load test in which the ultimate loads are properly applied. (See §§ 4a.61 and 4a.230 (b).)

(i) **Proof test.** A static load test in which the yield loads are properly applied for a period of at least 1 minute. (See § 4a.62.)

(j) **Balancing loads.** Loads by which the airplane is placed in a state of equilibrium under the action of external forces resulting from specified loading conditions. The state of equilibrium thus obtained may be either real or fictitious. Balancing loads may represent air loads, inertia loads, or both. (See § 4a.116.)

§ 4a.44 Aerodynamic coefficients, C_L , C_M , C_P , etc. The coefficients hereinafter specified are those of the "absolute" (nondimensional) system adopted as standard in the United States. The subscripts N and C used hereinafter refer respectively to directions normal to and parallel with the basic chord of the airfoil section. Other subscripts have the usual significance. When applied to an entire wing or surface, the coefficients represent average values and shall be properly correlated with local conditions (load distribution) as required in § 4a.99.

§ 4a.45 Standard atmosphere (standard air). Standard atmosphere refers to that variation of air conditions with altitude which has been adopted as standard in the United States. (See any aeronautics text book or handbook, or NACA Technical Report No. 218.)

§ 4a.46 *Primary structure.* Those portions of the airplane the failure of which would seriously endanger the safety of the airplane.

[Amdt. 5, 4 F. R. 1171]

SUBPART C—STRUCTURAL LOADING CONDITIONS

SOURCE: §§ 4a.61 to 4a.216 contained in Civil Air Regulations, May 31, 1938, as amended by Amdt. 75, 5 F. R. 3946, except as noted following sections affected.

GENERAL STRUCTURAL REQUIREMENTS

§ 4a.61 *Strength.* The primary structure (see § 4a.46) shall be capable of supporting the ultimate loads (see § 4a.43 (f)) determined by the loading conditions and ultimate factors of safety hereinafter specified, the loads being properly distributed and applied.

§ 4a.62 *Deformations.* The primary structure shall be capable of supporting without detrimental permanent deformations, for a period of at least one minute, the yield loads (see § 4a.43 (g)) determined by the loading conditions and yield factors of safety hereinafter specified, the loads being properly distributed and applied. Where no yield factor of safety is specified a factor of 1.0 shall be assumed. In addition, temporary deformations which occur before the yield load is reached shall be of such a nature that their repeated occurrence will not weaken or damage the primary structure.

§ 4a.63 *Stiffness.* The primary structure shall be capable of supporting the limit loads (see § 4a.43 (b)) determined by the loading conditions specified in this part without deflecting beyond whatever limits may be prescribed in this part or which may be deemed necessary by the Administrator for the case in question.

§ 4a.64 *Proof of strength and rigidity.* No general requirements, but see Subpart D for specific requirements.

§ 4a.65 *Materials, fabrication, protection, etc.* No general requirements, but see Subpart E for specific requirements.

FLIGHT LOADS

§ 4a.72 *General.* The airworthiness rating of an airplane with respect to its strength under flight loads will be based on the air speeds and accelerations (from maneuvering or gusts) which can safely be developed in combination. For certain classes of airplanes the acceleration factors and gust velocities are arbitrarily specified hereinafter and shall be used for those classes. The air speeds which can safely be developed in combination with the specified acceleration factors and gusts shall be determined in accordance with the procedure specified in this part and shall serve as a basis for restricting the operation of the airplane in flight. (See § 4a.726.)

AIR SPEEDS

§ 4a.73 *Air speeds.* (See § 4a.40 for definitions.) The design air speeds shall be determined as follows:

- (a) V_L (see § 4a.40 (c)).
- (b) V_p shall not be less than

$$V_L + K_p (V_m - V_L),$$

except that it need not be greater than either $V_L + 100$ miles per hour or $1.5 V_L$, whichever is lower. K_p is specified on Figure 4a-1. V_m is defined in § 4a.40 (g). A special ruling may be obtained from the Administrator if the design gliding speed thus determined is greater than $1.33 V_L$ and appears to be unnecessarily high for the type of airplane involved.

(c) V_f shall not be less than $2V_{sf}$. V_{sf} is defined in § 4a.40 (e).

(d) V_p shall not be less than

$$V_{sf} + K_p (V_L - V_{sf}),$$

except that it need not be greater than V_L . K_p is specified on Figure 4a-2.

(e) (See §§ 4a.120, 4a.123, and 4a.125 for exceptions for multiengine airplanes.)

[Amdt. 5, 4 F. R. 1171, as amended by Amdt. 75, 5 F. R. 3946]

LOAD FACTORS

§ 4a.74 *General.* The flight load factors specified in §§ 4a.75-4a.99 shall represent wing load factors. The net load factor, or acceleration factor, shall be obtained by proper consideration of balancing loads acting on the airplane in the specific flight conditions.

§ 4a.75 *Maneuvering load factors.* The limit maneuvering load factors specified in this part (see Fig. 4a-3) are derived largely from experience with conventional types of airplanes and shall be considered as minimum values unless it can be proved, to the satisfaction of the Administrator, that the airplane embodies features of design which make it impossible to develop such values in flight, in which case lower values may be used subject to the approval of the Administrator.

§ 4a.76 *Gust load factors.* The gust load factors shall be computed on the basis of a gust of the magnitude specified, acting normal to the flight path, and proper allowance shall be made for the effects of aspect ratio on the slope of the lift curve. The gust velocities specified shall be used only in conjunction with the gust formulas specified in Civil Aeronautics Manual 4.2121.

[Amdt. 48, 5 F. R. 1835, as amended by Amdt. 75, 5 F. R. 3946]

§ 4a.77 *Factors of safety.* The minimum factors of safety are specified for each loading condition.

CROSS REFERENCE: For multiplying factors of safety required in certain cases, see §§ 4a.207-4a.216.

SYMMETRICAL FLIGHT CONDITIONS (FLAPS RETRACTED)

§ 4a.78 *General.* The flight conditions as set forth in §§ 4a.79-4a.85, together with Table 4a-1, shall be considered as representing the minimum number of conditions required to cover a suitable range of symmetrical flight loadings.

§ 4a.79 *Condition I (positive high angle of attack).* The factors given in Table 4a-1 and Figure 4a-3 for this condition shall be used. To provide for flight conditions critical for the front lift truss or its equivalent the aerodynamic char-

acteristics C_N , CP (or C_M), and C_c shall be determined as follows:

$$(a) \quad C_{N_I} = \frac{n_I (W/S)}{q_L}$$

(q_L is dynamic pressure corresponding to V_L ; see §§ 4a.40 (c) and 4a.42.)

(b) C_c = value corresponding to C_{N_I} , or value equal to $-.20 C_{N_I}$, whichever is greater negatively.

(c) CP = most forward position of the center of pressure between $C_L = C_{N_I}$ and $C_L \text{ max.}$; when C_{N_I} exceeds $C_L \text{ max.}$, the CP curve shall be extended accordingly.

(d) For biplane combinations the CP of the upper wing shall be assumed to be 2.5 percent of the chord forward of its nominal position.

(e) C_M = moment coefficient necessary to give the required CP in conjunction with C_{N_I} .

§ 4a.80 *Condition I₁ (positive high angle of attack modified).* The smaller of the two values of C_c specified in § 4a.79 (b), and the most rearward CP position in the range specified in § 4a.79 (c) shall also be investigated when Condition I is critical for the rear spar (or its equivalent) or if any portion of the front spar (or its equivalent) is likely to be critical in tension. Only the wings and wing bracing need be investigated for this condition.

§ 4a.81 *Condition II (negative high angle of attack).* The factors given in Table 4a-1 for this condition shall be used, with the following provisions:

$$(a) \quad C_{N_{II}} = \frac{n_{II} (W/S)}{q_L}$$

(b) C_c = actual value corresponding to $C_{N_{II}}$.

(c) When C_c is positive or has a negative value smaller than 0.02 it may be assumed to be zero.

(d) C_M = actual value corresponding to $C_{N_{II}}$.

§ 4a.82 *Condition III—(a) Positive low angle of attack.* The factors given in Table 4a-1 for this condition shall be used, with the following provisions:

$$(1) \quad C_{N_{III}} = \frac{n_{III} (W/S)}{q_0}$$

(q_0 is dynamic pressure corresponding to V_0 ; §§ 4a.40 (d) and 4a.42.)

(2) C_c = actual value corresponding to $C_{N_{III}}$.

(3) When C_c is positive or has a negative value smaller than 0.02 it may be assumed to be zero.

(4) C_M = actual value corresponding to $C_{N_{III}}$.

(b) *Positive low angle of attack, modified.* If the moment coefficient of the airfoil section at zero lift has a positive value, or a negative value smaller than 0.06, the effects of displaced ailerons on the moment coefficient shall be accounted for in condition III for that portion of the span incorporating ailerons. To cover this point it will be satisfactory to combine 75 percent of the loads acting in condition III with the loads due to a moment coefficient of $-0.08 - C_{M_{III}}$ acting over that portion only of the span incorporating ailerons. The design dynamic pressure for the

additional moment forces shall be equal to $0.75q_0$. Only the wings and wing bracing need be investigated for this condition.

[CAR, May 31, 1938, as amended by Amdt. 48, 5 F. R. 1835]

§ 4a.83 *Condition IV (negative low angle of attack)*. The factors given in Table 4a-1 for this condition shall be used, with the following provisions:

$$(a) C_{N_{IV}} = \frac{n_{IV}(W/S)}{q_0}$$

(b) C_c = actual value corresponding to $C_{N_{IV}}$.

(c) When C_c is positive or has a negative value smaller than 0.02 it may be assumed to be zero.

(d) C_M = actual value corresponding to $C_{N_{IV}}$.

[CAR, May 31, 1938, as amended by Amdt. 48, 5 F. R. 1835]

§ 4a.84 *Condition V (inverted flight)*. The factors given in Table 4a-1 for this condition shall be used, with the following provisions:

$$(a) C_{N_V} = \frac{n_V(W/S)}{q_L}$$

$$(b) C_c' = 0.$$

$$(c) CP' = 25 \text{ percent.}$$

(d) Only the rear (or single) lift truss system of externally braced wing structures need be investigated for this condition.

§ 4a.85 *Condition VI (gliding)*. The factors given in Table 4a-1 shall be used for this condition, with the following provisions:

(a) $C_{N_{VI}}$ = value corresponding to $C_{C_{max}}$ (positive).

$$(b) C_c' = C_{C_{max}} \text{ (positive)} + 0.01.$$

(c) C_M = actual value corresponding to $C_{N_{VI}}$.

(d) The drag of nacelles and other items attached to the wings shall be conservatively estimated and properly included in the investigation of this condition.

(e) Only the wings and wing bracing need be investigated for this condition.

[CAR, May 31, 1938, as amended by Amdt. 48, 5 F. R. 1835]

SYMMETRICAL FLIGHT CONDITIONS (FLAPS OR AUXILIARY DEVICES IN OPERATION)

§ 4a.86 *General*. When flaps or other auxiliary high-lift devices are installed on the wings, the design conditions shall be suitably modified to account for their use in flight. The modifications shall be based on the intended use of such devices and the aerodynamic characteristics of the wing. The conditions as set forth in §§ 4a.87-4a.89, together with Table 4a-2, shall be considered as representing the minimum number of conditions required to cover a suitable range of symmetrical flight loadings in cases where the flaps are used only at relatively low air speeds.

§ 4a.87 *Condition VII (positive gust, flaps deflected)*. The factors given in Table 4a-2 for this condition shall be used, with the following provisions:

(a) The most critical deflection of the flap shall be investigated.

(b) The magnitude and distribution of normal, chord, and moment forces over

the wing shall correspond to that which would be obtained in developing the specified limit gust load factor at the specified air speed.

[CAR, May 31, 1938, as amended by Amdt. 48, 5 F. R. 1835]

§ 4a.88 *Condition VIII (negative gust, flaps deflected)*. The factors given in Table 4a-2 for this condition shall be used, with the following provisions:

(a) The most critical deflection of the flap shall be investigated.

(b) The magnitude and distribution of normal, chord, and moment forces over the wing shall correspond to that which would be obtained in encountering the specified limit gust load factor at the specified air speed.

[CAR, May 31, 1938, as amended by Amdt. 48, 5 F. R. 1835]

§ 4a.89 *Condition IX (dive, flaps deflected)*. The factors given in Table 4a-2 for this condition shall be used, with the following provisions:

(a) The most critical deflection of the flap shall be investigated.

(b) The load factor and the magnitude and distribution of normal, chord, and moment forces over the wing shall correspond to the angle of attack at which the greatest rearward chord loads are produced on the wing structure.

(c) Only the wings and wing bracing need be investigated for this condition.

UNSYMMETRICAL FLIGHT CONDITIONS

§ 4a.90 *General*. In the unsymmetrical flight conditions set forth in §§ 4a.91-4a.93, the unbalanced rolling moment shall be assumed to be resisted by the angular inertia of the complete airplane. See Civil Aeronautics Manual 4.2150 for an acceptable alternative procedure.

[Amdt. 48, 5 F. R. 1834, as amended by Amdt. 75, 5 F. R. 3946]

§ 4a.91 *Condition I_u*. Condition I (§ 4a.79) shall be modified by assuming 100 percent of the air load acting on one wing and 40 percent on the other. For airplanes over 1,000 pounds standard weight the latter factor may be increased linearly with standard weight up to 80 percent at 25,000 pounds.

[Amdt. 48, 5 F. R. 1834]

§ 4a.92 *Condition III_u*. Condition III (§ 4a.82) shall be modified as described for condition I_u in § 4a.91.

[Amdt. 48, 5 F. R. 1835]

§ 4a.93 *Condition V_u*. Condition V (§ 4a.84) shall be modified as described for condition I_u in § 4a.91.

SPECIAL FLIGHT CONDITIONS

§ 4a.94 *Gust at reduced weight*. The requirements for gust conditions (excepting tail surface gust conditions) under any loading between minimum and maximum design weight shall be met by primary structure critically loaded thereby.

§ 4a.95 *Lift-wire-cut*. For wings employing wire bracing in the lift truss, Conditions I and III shall be investigated, using load factors n_I and n_{III} of one-half the values specified for these conditions and assuming that any lift wire is out of action. This requirement does not

apply to parallel double lift wires, for which case see § 4a.210.

§ 4a.96 *Drag-wire-cut*. Drag struts in double-truss systems shall be designed to withstand the loads developed when the drag wire of the upper system in one bay and the drag wire of the lower system in the adjacent bay are each carrying their limit loads from any flight condition, the remaining wires in these two bays being assumed to be out of action. The minimum ultimate factor of safety shall be 1.5.

§ 4a.97 *Unsymmetrical propeller thrust*. The structure shall incorporate an ultimate factor of safety of 1.5 against failure due to loads caused by maximum (except take-off) power applied on one side of the plane of symmetry only, when power on the other side is off and the airplane is in unaccelerated rectilinear flight.

§ 4a.98 *Wing tanks empty*. If fuel tanks are supported by the wing structure, such structure and its bracing shall also be investigated for conditions I, II, III, and IV with wing tanks empty. The design weight may be reduced by 0.9 pound per certified maximum (except take-off) horsepower.

WING LOAD DISTRIBUTION

§ 4a.99 *Wing load distribution*. The limit air loads and inertia loads acting on the wing structure shall be distributed and applied in a manner closely approximating the actual distribution in flight.

CONTROL SURFACE LOADS

§ 4a.115 *General*. In addition to the flight loads specified in §§ 4a.72-4a.99 the primary structure shall meet the requirements specified in this part to account for the loads acting on the control surfaces. The following loading conditions include the application of balancing loads (§ 4a.43 (j)) derived from the symmetrical flight conditions and also cover the possibility of loading the control surfaces and systems in operating the airplane and by encountering gusts. See also §§ 4a.207-4a.316 for multiplying factors of safety required in certain cases.

HORIZONTAL TAIL SURFACES

§ 4a.116 *Balancing*. The limit load acting on the horizontal tail surface shall not be less than the maximum balancing load obtained from conditions I, II, III, IV, VII, and VIII set forth in §§ 4a.79, 4a.81, 4a.82, 4a.83, 4a.87 and 4a.88. In computing these loads for tail surface design the moments of fuselage and nacelles shall be suitably accounted for. The factors given in Tables 4a-3 shall be used, with the following provisions:

(a) For conditions I, II, III, and IV, P (in Fig. 4a-4) = 40 percent of net balancing load. (This means that the load on the fixed surface should be 140 percent of the net balancing load.) In any case P need not exceed that corresponding to a limit elevator control force of 150 pounds, applied by the pilot.

(b) For conditions VII and VIII, P may be assumed equal to zero.

[Amdt. 48, 5 F. R. 1835]

§ 4a.117 *Maneuvering (horizontal surfaces)*. The factors and distributions

specified in Table 4a-3 and Fig. 4a-5 for this condition shall be used, together with the following provisions:

(a) The limit unit loading in either direction need not exceed that corresponding to a 200-pound force on the elevator control (see Table 4a-6).

(b) The average limit unit loading shall not be less than 15 pounds per square foot (see Table 4a-3).

[Amdt. 48, 5 F. R. 1835]

§ 4a.118 Damping (horizontal surfaces). The total limit load acting down on the fixed surface (stabilizer) in the maneuvering condition (§ 4a.117) shall be applied in accordance with the load distribution of Fig. 4a-6, acting in either direction. The load acting on the movable surface in the maneuvering condition may be neglected in determining the damping loads.

§ 4a.119 Tab effects (horizontal surfaces). When a tab is installed so that it can be used by the pilot as a trimming or assisting device, a limit up load over the tab corresponding to the dynamic pressure at V_L and the maximum tab deflection shall be assumed to act in conjunction with the limit down load specified in § 4a.117, disregarding the provisions of § 4a.117 (a), applied over the remaining area. If the control force necessary to balance the resulting loads on the elevator and tab exceeds 200 pounds (Table 4a-6), the loadings over the areas not covered by the tab may be reduced until the control force is equal to this maximum limit value.

[Amdt. 48, 5 F. R. 1835]

VERTICAL TAIL SURFACES

§ 4a.120 Maneuvering. The factors given in Table 4a-4 and Fig. 4a-5 for this condition shall be used, with the following provisions:

(a) If the propeller axes are not in the plane of symmetry, the design speed shall not be less than the maximum speed in level flight with any engine inoperative.

(b) The limit unit loading in either direction need not exceed that corresponding to the maximum limit control force (Table 4a-6) except as modified by paragraph (c) of this section.

(c) In any case the average limit unit loading shall not be less than the minimum pressure specified in Table 4a-4 for this condition.

§ 4a.121 Damping (vertical surfaces). The total limit load acting on the fixed surface (fin) in the maneuvering condition shall be applied in accordance with the load distribution of Fig. 4a-6, acting in either direction. The load acting on the movable surface in the maneuvering condition may be neglected in determining the damping loads.

§ 4a.122 Gusts (vertical surfaces). The gust conditions specified in Table 4a-4 shall be applied, using the following formulas and provisions:

(a) The gust shall be assumed to be sharp-edged and to act normal to the plane of symmetry in either direction.

(b) The average limit unit pressure, w , developed in striking the gust shall be determined from the following formula:

$$w = UVm/575,$$

where

w is in pounds per square foot,

U is in feet per second,

V is in miles per hour, and

m = slope of lift curve, C_L per radian, corrected for aspect ratio. The aspect ratio shall not be taken as less than 2.0 in any case.

(c) This condition applies only to that portion of the vertical surface which has a well-defined leading edge.

(d) The chord distribution extending over the fixed and movable surfaces shall simulate that for a symmetrical airfoil, except that the distribution in Fig. 4a-6 may be used where applicable.

§ 4a.123 Tab effects (vertical surfaces). (a) When a tab is installed on the vertical movable tail surface so that it can be used by the pilot as a trimming device the limit unit loading over the entire vertical tail surfaces shall not be less than that corresponding to the maximum deflection of the tab together with simultaneous application of the following control force in a direction assisting the tab action:

(1) For airplanes with all propeller axes in the plane of symmetry, zero.

(2) For airplanes with propeller axes not in the plane of symmetry, 200 pounds.

(b) The factors specified in Table 4a-4 for this condition shall be used, with the following exception:

(1) If the propeller axes are not in the plane of symmetry, the design speed V_L specified in Table 4a-4 may be reduced to the maximum speed in level flight with any engine inoperative.

§ 4a.124 Special cases (vertical surfaces). A special ruling shall be obtained from the Administrator when an automatic pilot is used on airplanes with propeller axes not in the plane of symmetry.

AILERONS

§ 4a.125 Maneuvering. The factors given in Table 4a-5 and Fig. 4a-7 for this condition shall be used, with the following provisions:

(a) If the propeller axes are not in the plane of symmetry, the design speed shall not be less than the maximum speed in level flight with any engine inoperative.

(b) The limit unit loading in either direction need not exceed that corresponding to the maximum control force (Table 4a-6) resisted by only one aileron, except as modified by paragraph (c) of this section.

(c) In any case the average limit unit loading shall not be less than the minimum pressure specified in Table 4a-5 for this condition.

§ 4a.126 Tab effects (ailerons). (Applies only to airplanes with propeller axes not in the plane of symmetry.) When a tab is installed on one or both ailerons so that it can be used by the pilot to assist in moving the ailerons, the limit unit loading over both ailerons shall be of sufficient magnitude and in such direction as to hold the ailerons in equilibrium with the tab or tabs deflected to the maximum position. The factors specified in Table 4a-5 for this condition shall be used.

§ 4a.127 Flying conditions (ailerons). The ailerons and their control system shall be capable of meeting all requirements specified in the basic symmetrical flying conditions so far as the latter produce symmetrical loads on the ailerons.

WING FLAPS AND TABS

§ 4a.128 Wing flaps. Wing flaps shall be loaded in accordance with conditions VII and VIII (§§ 4a.87, 4a.88) and in addition shall be capable of developing an ultimate factor of safety of at least 1.5 with respect to any intermediate conditions which are more severe for any part of the flap or its operating mechanism.

§ 4a.129 Tabs. The limit forces acting on control-surface tabs shall be determined from the most severe combination of airplane speed and tab normal force coefficient likely to be obtained for any usable loading condition of the airplane and at speeds up to the design gliding speeds, V_G . An ultimate factor of safety of at least 1.5 shall be maintained.

SPECIAL DEVICES

§ 4a.130 Special devices. Special rulings shall be obtained from the Administrator in connection with the design and analysis of wing-slot structures, spoilers, unconventional ailerons, auxiliary airfoils, and similar devices. Requests for special rulings shall be accompanied by suitable drawings or sketches of the structure in question, together with general information and an outline of the method by which it is proposed to determine the structural loading.

CONTROL SYSTEM LOADS

§ 4a.137 General. All control systems shall be designed for limit loads 25 percent greater than those corresponding to the limit loads specified for the control surfaces to which they are attached, assuming the movable surface to be in that position which produces the greatest load in the control system, except that the maximum and minimum control force limits in Table 4a-6 shall apply as specified in this part. The factors of safety specified in Table 4a-6 shall be used.

CROSS REFERENCES: For multiplying factors of safety required in certain cases, see §§ 4a.207-4a.216. For operation requirements for control systems, see § 4a.271.

§ 4a.138 Control wires or push rods. The forces in the control wires or push rods operating the movable surfaces shall be computed and their effect on the rest of the structure shall be investigated and allowed for in the design of such structure.

§ 4a.139 Elevator systems. In applying § 4a.137 the control force specified in Table 4a-6 and Fig. 4a-8 shall be assumed to act in a fore-and-aft direction and shall be applied at the grip of a control stick, or shall be equally divided between two diametrically opposite points on the rim of a control wheel.

§ 4a.140 Rudder systems. In applying § 4a.137 the control force specified in Table 4a-6 shall be assumed to act in a direction which will produce the greatest load in the control system and shall be

applied at the point of contact of the pilot's foot.

§ 4a.141 *Aileron systems.* In applying § 4a.137 it shall be assumed that the ailerons are loaded in opposite directions. The control force specified in Table 4a-6 and Fig. 4a-9 shall be assumed to act in a lateral direction at the grip of a control stick, or shall be assumed to act as part of couple equal to the specified force multiplied by the diameter of a control wheel. The following assumptions shall be made:

(a) For nondifferential ailerons, 75 percent of the stick force or couple shall be assumed to be resisted by a down aileron, the remainder by the other aileron; also, as a separate condition, 50 percent shall be assumed to be resisted by an up aileron, the remainder by the other aileron.

(b) For differential ailerons, 75 percent of the stick force or couple shall be assumed to be resisted by each aileron in either the up or down position, or rational assumptions based on the geometry of the system shall be made.

§ 4a.142 *Flap and tab control systems.* In applying § 4a.137 suitable minimum manual forces shall be assumed to act on flap and tab control systems and other similar controls.

GROUND LOADS

§ 4a.147 *General.* The conditions set forth in §§ 4a.148-4a.156 represent the minimum amount of investigation required for conventional (tail down type) landing gear. For unconventional types it may be necessary to investigate other landing attitudes, depending on the arrangement and design of the landing gear members. Consideration will be given to a reduction of the specified limit load factors when it can be proved that the shock absorbing system will positively limit the acceleration factor to a definite lower value in the drop test specified in § 4a.148 (b). The minimum factors of safety are specified for each loading condition. See also §§ 4a.207 through 4a.216 for multiplying factors of safety required in certain cases.

§ 4a.148 *Level landing.* The minimum limit load factor is specified in Fig. 4a-10. The resultant of the ground reaction shall be assumed to be a force lying at the intersection of the plane of symmetry and a plane in which are located the axles and the center of gravity of the airplane less chassis. The propeller axis (or equivalent reference line) shall be assumed horizontal and the basic value of the vertical component of the resultant of the ground reaction shall be equal to the gross weight of the airplane minus chassis and wheels. The horizontal component shall be of the magnitude required to give the resultant force the specified direction except that it need not be greater than 25 percent of the vertical component. The resultant of the ground reaction shall be assumed to be divided equally between wheels and to be applied at the axle at the center of the wheel. The shock-absorber unit and tires shall be assumed to be deflected to half their total travel, unless it is apparent that a more critical arrangement

could exist. The minimum ultimate factor of safety shall be 1.5.

(a) *Sliding element.* If a sliding element instead of a rolling element is used for the landing gear, a horizontal component of one-half of the vertical component shall be used to represent the effect of ground friction, except that ski gear which is designed and used only for landing on snow and ice may be designed for the same horizontal component as wheel gear.

(b) *Energy absorption.* The level landing condition specified in § 4a.148 shall be assumed to be produced by a free drop, in inches, equal to 0.36 times the calculated stalling speed (V_s) in miles per hour, except that the height of free drop shall not be less than 18 inches for airplanes employing devices which increase the normal sinking speed, but need not exceed 18 inches when such devices are not employed. The height of free drop is measured from the bottom of the tire to the ground, with the landing gear extended to its extreme unloaded position. (See §§ 4a.278, 4a.475.)

§ 4a.151 *Three-point landing.* The minimum limit load factor is specified in Fig. 4a-10. The value of the sum of the static ground reactions shall be the gross weight of the airplane less chassis. The total load shall be divided between the chassis and tail skid or wheel in inverse proportion to the distances, measured parallel to the ground line, from the center of gravity of the airplane less chassis to the points of contact with the ground. The load on the chassis shall be divided equally between wheels. Loads shall be assumed to be perpendicular to the ground line in the three-point landing attitude, with all shock absorbers and tires deflected to the same degree as in level landing. The tail wheel or skid installation shall also be investigated for this condition. The minimum ultimate factor of safety shall be 1.5.

§ 4a.152 *Energy absorption.* The three-point landing condition specified in § 4a.151 shall be assumed to be produced by a free drop as specified under § 4a.148 (b). This requires shock absorption by both main wheels and tail wheel (or skid). (See §§ 4a.278, 4a.475.)

§ 4a.153 *Side load.* The minimum limit load factor shall be 0.667. The weight of the airplane shall be assumed to act on one wheel in a direction perpendicular to the ground. In addition, a side component of equal magnitude shall be assumed to act inward and normal to the plane of symmetry at the point of contact of the wheel, and an aft component equal to 0.55 times the vertical component shall be assumed to act parallel to the ground at such point. The airplane shall be assumed to be in a three-point attitude with the shock absorbers deflected to their static position and the tires deflected one-quarter the nominal diameter of their cross section. The minimum ultimate factor of safety shall be 1.5.

§ 4a.154 *One-wheel landing.* An investigation of the fuselage structure is required for a one-wheel landing, in which only those loads obtained on one side of the fuselage in the level landing

condition are applied. The resulting load factor is therefore one-half of the level landing load factor. (This condition is identical with the level landing condition insofar as the landing gear structure is concerned.) The minimum ultimate factor of safety shall be 1.5.

§ 4a.155 *Braked landing.* The minimum limit load factor shall be 1.33. Airplanes equipped with brakes shall be investigated for the loads incurred when a landing is made with the wheels locked and the airplane is in an attitude such that the tail skid or wheel just clears the ground. The weight of the airplane less chassis shall be assumed to act on the wheels in a direction perpendicular to the ground line in this attitude. In addition, a component parallel to the ground line shall be assumed to act at the point of contact of the wheels and the ground, the magnitude of this component being equal to the weight of the airplane less chassis times a coefficient of friction of 0.55. The tire in all cases shall be assumed to have deflected not more than one-quarter the nominal diameter of its cross section, and the deflection of the shock absorbers shall be the same as in level landing. The minimum ultimate factor of safety shall be 1.5.

§ 4a.156 *Side loads on tail wheel or skid.* Suitable assumptions shall be made to cover side loads acting on tail skids or tail wheels which are not free to swivel or which can be locked or steered by the pilot.

WATER LOADS

§ 4a.161 *General.* The requirements set forth in §§ 4a.162-4a.177 shall apply to the entire airplane, but have particular reference to hull structures, wings, nacelles, and float supporting structure. The requirements for certification of floats as individual items of equipment are specified in Part 15 of this subchapter. The minimum factors of safety are specified for each loading condition.

CROSS REFERENCES: For multiplying factors of safety required in certain cases, see §§ 4a.207-4a.216. For detail design requirements for hulls and floats, see §§ 4a.488-4a.492.

FLOAT SEAPLANES

§ 4a.162 *Landing with inclined reactions (float seaplanes).* The vertical component of the limit load factor shall be 4.20 except that it need not exceed a value given by the following formula:

$$n = 3.0 + 0.133 W/S.$$

The propeller axis (or equivalent reference line) shall be assumed to be horizontal and the resultant water reaction to be acting in the plane of symmetry and passing through the center of gravity of the airplane less floats and float bracing, but inclined so that its horizontal component is equal to one-quarter of its vertical component. The forces representing the weights of and in the airplane shall be assumed to act in a direction parallel to the water reaction. The weight of the floats and float bracing may be deducted from the gross weight of the airplane.

§ 4a.163 *Float attachment members.* For the design of float attachment members, including the members necessary to complete a rigid brace truss through the fuselage, the minimum ultimate factor of safety shall be 1.85. For the remaining structural members the minimum ultimate factor of safety shall be 1.50.

§ 4a.164 *Landing with vertical reactions (float seaplanes).* The limit load factor shall be 4.33, acting vertically, except that it need not exceed a value given by the following formula:

$$n = 3.0 + 0.133 W/S.$$

The propeller axis (or equivalent reference line) shall be assumed to be horizontal, and the resultant water reaction to be vertical and passing through the center of gravity of the airplane less floats and float bracing. The weight of the floats and float bracing may be deducted from the gross weight of the airplane.

§ 4a.165 *Safety factors.* The minimum factors of safety shall be the same as those specified in § 4a.163.

§ 4a.166 *Landing with side load (float seaplanes).* The vertical component of the limit load factor shall be 4.0, to be applied to the gross weight of the airplane less floats and float bracing. The propeller axis (or equivalent reference line) shall be assumed to be horizontal and the resultant water reaction shall be assumed to be in the vertical plane which passes through the center of gravity of the airplane less floats and float bracing and is perpendicular to the propeller axis. The vertical load shall be applied through the keel or keels of the float or floats, and evenly divided between the floats when twin floats are used. A side load equal to one-fourth of the vertical load shall be applied along a line approximately half way between the bottom of the keel and the level of the water line at rest. When built-in struts are used, check calculations shall be made for the built-in struts with the side load at the level of the water line at rest. When twin floats are used, the entire side load specified shall be applied to the float on the side from which the water reaction originates. The minimum ultimate factor of safety shall be 1.50.

BOAT SEAPLANES

§ 4a.167 *Local bottom pressures—(a) Maximum local pressure.* The maximum value of the limit local pressure shall be determined from the following equation:

$$P_{\max} = 0.055 V_s^{1.4} \left(1 + \frac{W}{50,000} \right)^{1/4}$$

where

p = pressure, pounds per square inch
 V_s = stalling speed, flaps down, power on, in miles per hour. (To be calculated on the basis of wind tunnel data or flight tests on previous airplanes.)
 W = design weight

The minimum ultimate factor of safety shall be 1.5.

(b) *Variation in local pressure.* The local pressures to be applied to the hull bottom shall vary in accordance with Figure 4a-11. No variation from keel to chine (beamwise) shall be assumed, ex-

cept when the chine flare indicates the advisability of higher pressures of the chine.

(c) *Application of local pressure.* The local pressure determined from § 4a.167 (a) and Figure 4a-11 shall be applied over a local area in such a manner as to cause the maximum local loads in the hull bottom structure.

[Amdt. 48, 5 F. R. 1836]

§ 4a.168 *Distributed bottom pressures.* (a) For the purpose of designing frames, keels, and chine structure, the limit pressures obtained from § 4a.167 (a) and Figure 4a-11 shall be reduced to one-half the "local" values and simultaneously applied over the entire hull bottom. The loads so obtained shall be carried into the side-wall structure of the hull proper, but need not be transmitted in a fore-and-aft direction as shear and bending loads. The minimum ultimate factor of safety shall be 1.5.

(b) *Unsymmetrical loading.* Each floor member or frame shall be designed for a load on one side of the hull centerline equal to the most critical symmetrical loading, combined with a load on the other side of the hull center line equal to one-half of the most critical symmetrical loading.

[Amdt. 48, 5 F. R. 1836]

§ 4a.169 *Step loading condition—(a) Application of load.* The resultant water load shall be applied vertically in the plane of symmetry so as to pass through the center of gravity of the airplane (in full load condition).

(b) *Acceleration.* The limit acceleration shall be 4.33.

(c) *Hull shear and bending loads.* The hull shear and bending loads shall be computed from the inertia loads produced by the vertical water load. To avoid excessive local shear loads and bending moments near the point of water load application, the water load may be distributed over the hull bottom, using pressures not less than those specified in § 4a.168 (a). The minimum ultimate factor of safety shall be 1.5.

[Amdt. 48, 5 F. R. 1836]

§ 4a.170 *Bow loading condition—(a) Application of load.* The resultant water load shall be applied in the plane of symmetry at a point one-tenth of the distance from the bow to the step and shall be directed upward and rearward at an angle of 30 degrees from the vertical.

(b) *Magnitude of load.* The magnitude of the limit resultant water load shall be determined from the following equation:

$$P_b = \frac{1}{2} n_s W_e$$

where

P_b = load in pounds,
 n_s = step landing load factor,
 W_e = effective weight which is assumed equal to one-half the design weight of the airplane.

(c) *Hull shear and bending loads.* The hull shear and bending loads shall be determined by proper consideration of the inertia loads which resist the linear and angular accelerations involved. To avoid excessive local shear loads, the water re-

action may be distributed over the hull bottom, using pressures not less than those specified in § 4a.168 (a). The minimum ultimate factor of safety shall be 1.5.

[Amdt. 48, 5 F. R. 1836]

§ 4a.171 *Stern loading condition—(a) Application of load.* The resultant water load shall be applied vertically in the plane of symmetry and shall be distributed over the hull bottom from the second step forward with an intensity equal to the pressures specified in § 4a.168 (a).

(b) *Magnitude of load.* The limit resultant load shall equal three-quarters of the design weight of the airplane.

(c) *Hull shear and bending loads.* The hull shear and bending loads shall be determined by assuming the hull structure to be supported at the wing attachment fittings and neglecting internal inertia loads. This condition need not be applied to the fittings or to the portion of the hull ahead of the rear attachment fittings. The minimum ultimate factor of safety shall be 1.5.

[Amdt. 48, 5 F. R. 1836]

§ 4a.172 *Side loading condition—(a) Application of load.* The resultant water load shall be applied in a vertical plane through the center of gravity. The vertical component shall be assumed to act in the plane of symmetry and the horizontal component at a point half way between the bottom of the keel and the load water line at design weight (at rest).

(b) *Magnitude of load.* The limit vertical component of acceleration shall be 3.25 and the side component shall be equal to 15 percent of the vertical component.

(c) *Hull shear and bending loads.* The hull shear and bending loads shall be determined by proper consideration of the inertia loads or by introducing couples at the wing attachment points. To avoid excessive local shear loads, the water reaction may be distributed over the hull bottom, using pressures not less than those specified in § 4a.168 (a). The minimum ultimate factor of safety shall be 1.5.

[Amdt. 48, 5 F. R. 1836]

SEAPLANE FLOAT LOADS

§ 4a.173 *Seaplane float loads.* Each main float of a float seaplane shall be capable of carrying the following loads when supported at the attachment fittings as installed on the airplane. The minimum ultimate factor of safety shall be 1.5.

(a) A limit load, acting upward, applied at the bow end of the float and of magnitude equal to one-half of that portion of the airplane gross weight normally supported by the particular float.

(b) The limit load specified in paragraph (a) of this section, acting upward at the stern.

(c) A limit load, acting upward, applied at the step and of magnitude equal to 1.33 times that portion of the airplane gross weight normally supported by the particular float.

[Amdt. 5, 4 F. R. 1171]

§ 4a.174 *Seaplane float bottom loads.* Main seaplane float bottoms shall be designed to withstand the following loads. The minimum ultimate factor of safety shall be 1.5.

(a) A limit load of at least 5.33 pounds per square inch over that portion of the bottom lying between the first step and a section at 25 percent of the distance from the step to the bow.

(b) A limit load of at least 2.67 pounds per square inch over that portion of the bottom lying between the section at 25 percent of the distance from the step to the bow and a section at 75 percent of the distance from the step to the bow.

(c) A limit load of at least 2.67 pounds per square inch over that portion of the bottom lying between the first and second steps. If only one step is used, this load shall extend over that portion of the bottom lying between the step and a section at 50 percent of the distance from the step to the stern.

WING-TIP FLOAT LOADS

§ 4a.175 *Wing-tip float loads.* Wing-tip floats and their attachment, including the wing structure, shall be analyzed for each of the following conditions, using a minimum ultimate factor of safety of 1.5:

(a) A limit load acting vertically up at the completely submerged center of buoyancy and equal to three times the completely submerged displacement.

(b) A limit load inclined upward at 45 degrees to the rear and acting through the completely submerged center of buoyancy and equal to three times the completely submerged displacement.

(c) A limit load acting parallel to the water surface (laterally) applied at the center of area of the side view and equal to one and one-half times the completely submerged displacement.

§ 4a.176 *Wing structure.* The primary wing structure shall incorporate sufficient extra strength to insure that failure of wing-tip float attachment members occurs before the wing structure is damaged.

MISCELLANEOUS WATER LOADS

§ 4a.177 *Sea wing loads.* Special rulings shall be obtained from the Administrator for the strength requirements for sea wings.

SPECIAL LOADING CONDITIONS

§ 4a.187 *Engine torque.* In the case of engines having five or more cylinders the stresses due to the torque load shall be multiplied by a limit load factor of 1.5. For 4-, 3-, and 2-cylinder engines the limit load factors shall be 2, 3, and 4, respectively. The torque acting on the airplane structure shall be computed for the take-off power desired and the propeller speed corresponding thereto (see § 4a.727). The engine mount and forward portion of the fuselage and nacelles shall be designed for this condition. The minimum ultimate factor of safety shall be 1.5 unless higher factors are deemed necessary by the Administrator in order to make special provision for conditions such as vibration, stress concentration, and fatigue.

[Amdt. 5, 4 F. R. 1171, as amended by Amdt. 75, 5 F. R. 3946]

§ 4a.188 *High angle of attack and torque.* The limit loads determined from § 4a.187 shall be considered as acting simultaneously with 75 percent of the limit loads determined from condition I (§ 4a.79). The engine mount, nacelles, and forward portion of the fuselage (when a nose engine is installed) shall be designed for this condition. The minimum ultimate factor of safety shall be 1.5.

§ 4a.189 *Engine mounts, nacelles, etc.* The engine mounts, nacelles, and forward portion of the fuselage (when a nose engine is installed) shall be investigated for the limit loads determined from condition I (see §§ 4a.79 and 4a.94) acting simultaneously with the limit loads due to the engine torque determined in accordance with § 4a.187, except that the engine power and the propeller speed shall correspond to the design power (§ 4a.38 (b)) or the output specified for climbing flight (see § 4a.727), whichever is higher. The minimum ultimate factor of safety shall be 1.5.

[Amdt. 5, 4 F. R. 1171]

§ 4a.190 *Side load on engine mount.* The limit load factor for this condition shall be equal to one-third of the limit load factor for flight condition I (§ 4a.79) but shall in no case be less than 1.33. The engine mount and forward section of the fuselage and nacelles shall be analyzed for this condition, considering the limit load to be produced by inertia forces. The minimum ultimate factor of safety shall be 1.5.

§ 4a.191 *Up load on engine mount.* For engine mounts the limit load in each member shall be arbitrarily assumed as 50 percent of that in the level landing condition but of opposite sign. The minimum ultimate factor of safety will be 1.5.

§ 4a.192 *Passenger loads.* Passenger loads in the accelerated flight conditions shall be computed for a standard passenger weight of 170 pounds and a minimum ultimate factor of safety of 1.50 shall be used, except that seats and berths need not be designed for the reduced weight gust conditions specified in § 4a.94. This shall not exempt the primary structure from such gust conditions.

§ 4a.193 *Structures with safety belts.* Structures to which safety belts are attached shall be capable of withstanding an ultimate load of 1,000 pounds per person applied through the safety belt and directed upward and forward at an angle of 45 degrees with the floor line.

§ 4a.194 *Local loads.* The primary structure shall be designed to withstand local loads caused by dead weights and control loads. Baggage compartments shall be designed to withstand loads corresponding to the maximum authorized capacity. The investigation of dead weight loads shall include a sufficient number of reduced weight gust conditions to insure that the most severe combinations have been investigated.

CROSS REFERENCE: For standard weights, see § 4a.771.

§ 4a.195 *Rigging loads.* Structures braced by wires (or tie-rods) shall be capable of developing an ultimate factor of safety of 1.5 with respect to the limit loads due to rigging the wires to 20 percent of their rated strength (strength of wire, not terminal). When the structure is such that all wires cannot be simultaneously rigged to 20 percent of their rated loads, a rigging condition shall be assumed in which the average of the rigging loads, expressed in percent, equals 20. (See also § 4a.211.) The above condition need not be superimposed on other loading conditions, but the Administrator may require additional investigation for residual rigging loads when such investigation appears necessary. (See also § 4a.253.)

§ 4a.196 *Air loads on struts.* External wing-brace struts which are at an angle of more than 45 degrees with the plane of symmetry and which have a cross-sectional fineness ratio of more than 3 shall be assumed to act as lifting air foils and shall be designed to carry the resultant transverse loads in combination with the specified axial loads. In computing the limit loads the strut sections shall be assumed to have a normal force coefficient equal to 1.0 and the total air load shall be based on the exposed area of the strut. The chord components and vertical reactions of such air load and the lift contributed by the strut shall not be considered in the analysis of the wing.

MULTIPLYING FACTORS OF SAFETY

§ 4a.207 *General.* In addition to the minimum factors of safety specified for each loading condition, the multiplying factors specified in Table 4a-7 and §§ 4a.208-4a.216 shall be incorporated in the structure. The total factor of safety required for any structural component or part equals the minimum factor of safety specified for the loading condition in question multiplied by the factors of safety hereinafter specified, except that certain multiplying factors may be included in others, as indicated in Table 4a-7.

§ 4a.208 *Fittings.* All fittings in the primary structure shall incorporate the multiplying factor of safety specified in Table 4a-7. For this purpose fittings are defined as parts used to connect one primary member to another and shall include the bearing of those parts on the members thus connected. Continuous joints in metal plating and welded joints between primary structural members are not classified as fittings. (See also §§ 4a.320, 4a.321.)

§ 4a.209 *Castings.* All castings used in the primary structure shall incorporate a multiplying factor of safety not less than that specified in Table 4a-7.

§ 4a.210 *Parallel double wires.* When parallel double wires are used in wing lift trusses each wire shall incorporate a multiplying factor of safety not less than that specified in Table 4a-7.

§ 4a.211 *Wires at small angles.* Wire or tie-rod members of wing or tail surface external bracing shall incorporate a multiplying factor of safety computed as follows:

$K=L/2R$ (except that K shall not be less than 1.0)

where

K —the additional factor.

R —the reaction resisted by the wire in a direction normal to the wing or tail surface plane, and

L —the load required in the wire to balance the reaction R .

§ 4a.212 *Double drag trusses.* Whenever double drag trussing is employed, all drag wires shall incorporate a multiplying factor of safety varying linearly from 3.0, when the ratio of overhang to root chord of overhang is 2.0 or greater, to 1.20 when such ratio is 1.0 or less, assuming an equal division of drag load between the two systems.

§ 4a.213 *Torque tubes used as hinges.* When steel torque tubes are employed in direct bearing against strap-type hinges they shall incorporate a multiplying factor of safety at the hinge point not less than that specified in Table 4a-7. (See also § 4a.448.)

§ 4a.214 *Control surface hinges and control system joints.* Control surface hinges and control system joints subjected to angular motion, excepting ball or roller bearings and Army-Navy standard parts used in cable control systems, shall incorporate multiplying factors of safety not less than those specified in Table 4a-7 with respect to the ultimate bearing strength of the softest material used as a bearing. For ball or roller bearings a yield factor of safety of 1.0 with respect to the manufacturer's non-Brinell rating is considered sufficient to provide an adequate ultimate factor of safety.

§ 4a.215 *Wire sizes.* (See §§ 4a.319, 4a.322, 4a.335.)

§ 4a.216 *Wing lift truss system.* All structural members of the wing lift truss system which transmit direct loads from the landing gear shall, in the landing conditions, incorporate a multiplying factor of safety not less than that specified in Table 4a-7.

[Amdt. 5, 4 F. R. 1170]

SUBPART D—PROOF OF STRUCTURE

SOURCE: §§ 4a.227 to 4a.299 contained in Civil Air Regulations, May 31, 1938, as amended by Amendment 75, 5 F. R. 3946, except as noted following sections affected.

§ 4a.227 *General.* Proof of compliance with the loading requirements outlined in Subpart C shall be made in a manner satisfactory to the Administrator and may consist of structural analyses, load tests, flight tests, references to previously approved structures, or combinations of the above. Any condition which can be shown to be noncritical need not be further investigated.

§ 4a.228 *Proof of structural analysis.* (a) Structural analyses will be accepted as complete proof of strength only in the case of structural arrangements for which experience has shown such analyses to be reliable. References shall be given for all methods of analysis, formulas, theories, and material properties which are not generally accepted as standard. The acceptability of a structural analysis will depend to some extent

on the excess strength incorporated in the structure.

(b) The structural analysis shall be based on guaranteed minimum mechanical properties of the materials specified on the drawings, except in cases where exact mechanical properties of the materials used are determined.

(c) The effects of welding, form factors, stress concentrations, discontinuities, cutouts, instability, end fixity of columns and vibration shall be accounted for when such factors are present to such an extent as to influence the strength of the structure.

§ 4a.229 *Combined structural analysis and tests.* In certain cases it will be satisfactory to combine structural analysis procedure with the results of load tests of portions of the structure not subject to accurate analysis. In such cases test results shall be reduced to correspond to the mechanical properties of the materials actually used in the airplane. When a unit other than the specific one tested is incorporated in the airplane presented for certification, test results shall be reduced to correspond to the minimum guaranteed mechanical properties of the materials specified on the drawings.

§ 4a.230 *Load tests.* Proof of compliance with structural loading requirements by means of load tests only is acceptable: *Provided*, That strength and proof tests (see § 4a.43 (h) and (i)) are conducted to demonstrate compliance with §§ 4a.61, 4a.62, respectively: *And further provided*, That the following paragraphs of this section are complied with:

(a) The tests shall be supplemented by special tests or analyses to prove compliance with multiplying factor of safety requirements. (See §§ 4a.207-4a.216.)

(b) When a unit other than the specific one tested is incorporated in the airplane presented for certification, the results of strength tests shall be reduced to correspond to the minimum guaranteed mechanical properties of the materials specified on the drawings, unless test loads are carried at least 15 percent beyond the required values.

(c) The determination of test loads, the apparatus used, and the methods of conducting the tests shall be satisfactory to the Administrator.

(d) The tests shall be conducted in the presence of a representative of the Administrator unless otherwise directed by the Administrator.

§ 4a.231 *Flight load tests.* Proof of strength by means of flight load tests will not be accepted unless the necessity therefor is established and the test methods are proved suitable to the satisfaction of the Administrator.

§ 4a.232 *Load tests required.* The following load tests are required in all cases and shall be made in the presence of a representative of the Administrator unless otherwise directed by the Administrator:

(a) Strength tests of wing ribs. (See § 4a.248.)

(b) Pressure tests of fuel and oil tanks. (See § 4a.608.)

(c) Proof tests of tail and control surfaces. (See §§ 4a.263, 4a.264.)

(d) Proof and operating tests of control systems. (See §§ 4a.269, 4a.271.)

WINGS

§ 4a.237 *Proof of wings.* The strength of stressed-skin wings shall be substantiated by load tests (§ 4a.230) or by combined structural analysis and tests (§ 4a.229). The torsional rigidity of the wings shall be within a range of values satisfactory for the prevention of flutter. Compliance with such torsional rigidity requirement shall be demonstrated by static tests or other methods acceptable to the Administrator.

[Amdt. 98, 6 F. R. 1145]

§ 4a.238 *Redundancies.* Wing cel- lules in which the division of loading between lift trusses and drag trusses is indeterminate shall be analyzed either by an acceptable method for indeterminate structures or by making assumptions which result in conservative design loads for all members.

BEAMS

§ 4a.239 *Beams.* The points set forth in §§ 4a.240-4a.246 shall be covered in the proof of strength of wing beams, in addition to any special types of possible failure peculiar to the structure.

§ 4a.240 *Secondary bending.* When axial loads are present the required minimum ultimate factor of safety shall be introduced before the computation of the bending moments in order to insure that the required ultimate loads can be supported by the structure.

§ 4a.241 *Lateral buckling.* The ability of beams to resist lateral buckling shall be proved.

§ 4a.242 *Webs.* The strength of shear webs shall be proved.

§ 4a.243 *Axial load.* When axial load is present tests are required to determine the effective "EI" in the case of truss-type beams and beams having unconventional web construction.

§ 4a.244 *Joint slippage in wood beams.* When a joint in a wood beam is designed to transmit bending from one section of the beam to another or to the fuselage, the stresses in each part of the structure shall be calculated on the assumption that the joint is 100 percent efficient (except in mid-bay for which see § 4a.334) and also under the assumption that the bending moment transmitted by the joint is 75 percent of that obtained under the assumption of perfect continuity. Each part of the structure shall be designed to carry the most severe loads determined from the above assumptions.

§ 4a.245 *Bolt holes.* In computing the area, moment of inertia, etc., of wood beams pierced by bolts, the diameter of the bolt hole shall be assumed to be one-sixteenth inch greater than the diameter of the bolt.

§ 4a.246 *Box beams.* In computing the ability of box beams to resist bending loads only that portion of the web with its grain parallel to the beam axis and one-half of that portion of the web with

its grain at an angle of 45 degrees to the beam shall be considered. The more conservative method of neglecting the web entirely may be employed.

DRAG TRUSSES

§ 4a.247 *Drag trusses.* Drag struts shall be assumed to have an end fixity coefficient of 1.0 except in cases of unusually rigid restraint, in which a coefficient of 1.5 may be used.

RIBS

§ 4a.248 *Ribs.* The strength of ribs shall be proved by tests to at least 125 percent of the ultimate loads for the most severe loading conditions, except that consideration will be given to structural analyses in conjunction with suitable specimen test data when it can be demonstrated to the satisfaction of the Administrator that it is impractical to simulate the actual loading conditions in a static test. Such analyses shall, on the basis of guaranteed minimum material properties, show proof of strength at 125 percent of the required ultimate loads. The following points shall also apply in proving the strength of ribs.

§ 4a.249 *Load distribution.* The load shall be suitably distributed between upper and lower wing surfaces unless a more severe distribution is used.

§ 4a.250 *Ailerons and high-lift devices.* The effects of ailerons and high-lift devices shall be properly accounted for.

§ 4a.251 *Rib tests.* Rib tests shall simulate conditions in the airplane with respect to torsional rigidity of spars, fixity conditions, lateral support, and attachment to spars.

COVERING

§ 4a.252 *Covering.* Proof of strength of fabric covering is not required when standard grades of cloth and methods of attaching and doping are employed: *Provided, however,* That the Administrator may require special tests when it appears necessary to account for the effects of unusually high design air speeds or slipstream velocities, or similar factors. When metal covering is employed its ability to perform its structural function shall be demonstrated by tests of typical panels or by other means acceptable to the Administrator. In particular, compliance with § 4a.62 requires demonstration of the behavior of the covering under load in order to determine the effects of temporary deformations (wrinkles).

§ 4a.252-1 *Aircraft fabric (CAA rules which apply to § 4a.252).* See § 4b.302-1 and § 4b.302-2 of this subchapter.

[Supp. 1, 13 F. R. 7725]

NONPARALLEL WIRES

§ 4a.253 *Nonparallel wires.* When two or more wires are attached to a common point on the wing, but are not parallel, proper allowance for redundancies and the effects of rigging shall be made.

TAIL AND CONTROL SURFACES

§ 4a.263 *Proof of tail and control surfaces.* Structural analyses of tail and control surfaces will be accepted as com-

plete proof of compliance with ultimate load requirements only when the structure conforms with conventional types for which reliable analytical methods are available. Proof tests as defined in § 4a.43 (i) are required to prove compliance with yield load requirements.

(a) Control surface tests shall include the horn or fitting to which the control system is attached.

(b) In the analysis of control surfaces proper allowance shall be made for rigging loads in brace wires in cases where the counter wires do not go slack before the ultimate load is reached.

(c) Analyses or individual load tests shall be conducted to demonstrate compliance with the multiplying factor of safety requirements outlined in §§ 4a.207-4a.216 for control surface hinges and brace wires.

§ 4a.264 *Vibration tests.* The natural frequencies of vibration of the wings, fuselage, and control surfaces shall be within such ranges of values as are satisfactory for the prevention of flutter. Compliance with this requirement shall be demonstrated by vibration tests or other methods acceptable to the Administrator.

[Amdt 98, 6 F. R. 1145]

CONTROL SYSTEMS

§ 4a.269 *Proof of control systems.* Structural analyses of control systems will be accepted as complete proof of compliance with ultimate load requirements only when the structure conforms with conventional types for which reliable analytical methods are available. Proof tests as defined in § 4a.43 (i) are required to prove compliance with yield load requirements.

§ 4a.270 *Control system tests.* In control system tests, the direction of test loads shall be such as to produce the most severe loading of the control system structure. The tests shall include all fittings, pulleys, and brackets used to attach the control system to the primary structure.

§ 4a.271 *Operation test.* An operation test shall be conducted by operating the controls from the pilot's compartment with the entire system so loaded as to correspond to the minimum limit control force specified in item 3 of Table 4a-6 for the control system in question. In this test there shall be no jamming, excessive friction, or excessive deflection.

[Amdt. 48, 5 F. R. 1836]

§ 4a.272 *Control system joints.* Analyses or individual load tests shall be conducted to demonstrate compliance with the multiplying factor of safety requirements specified in §§ 4a.207 through 4a.216 for control system joints subjected to angular motion.

LANDING GEAR

§ 4a.277 *Proof of landing gear.* Structural analyses of landing gear will be accepted as complete proof of compliance with load requirements only when the structure conforms with conventional types for which reliable analytical methods are available. Analyses may be used to demonstrate compliance with the

energy absorption requirements in certain cases. When such analyses are not applicable, dynamic tests shall be conducted to demonstrate compliance with energy absorption requirements.

§ 4a.278 *Energy absorption tests.* When tests for energy absorption are required they shall be so conducted as to simulate the landing conditions for which energy absorption requirements are specified in § 4a.475, and test data shall be obtained from which the maximum acceleration developed at the center of gravity of the airplane can be determined. When drop tests of wheels, tires, and shock absorbers are conducted in a combination differing from that employed on the airplane, proper allowance and corrections shall be made for the errors thus introduced.

HULLS AND FLOATS

§ 4a.283 *Proof of hulls and floats.* Structural analyses of hulls and auxiliary floats will be accepted as complete proof of compliance with load requirements only when the structure conforms with conventional types for which reliable analytical methods are available. The strength of the structure as a whole and its ability to distribute water loads from the bottom plating into the main structural members shall be demonstrated. See Part 15 of this subchapter for the requirements for main floats.

FUSELAGES AND ENGINE MOUNTS

§ 4a.289 *Proof of fuselages and engine mounts.* Structural analyses of fuselages and engine mounts will be accepted as complete proof of compliance with load requirements only when the structure conforms with conventional types for which reliable analytical methods are available.

§ 4a.290 *Critical column loads.* The end fixity coefficient used in determining critical column loads shall in no case exceed 2.0. A value of 1.0 shall be used for all members in the engine mount. In doubtful cases, tests are required to substantiate the degree of restraint assumed.

§ 4a.291 *Baggage compartments.* The ability of baggage compartments to sustain the maximum authorized baggage loads under all required flight and landing conditions shall be demonstrated.

FITTINGS AND PARTS

§ 4a.297 *Proof of fittings and parts.* Proof of strength of all fittings and joints of the primary structure is required. Where applicable, structural analysis methods may be used. When such methods are inadequate, a load test is required. Compliance with the multiplying factor of safety requirements for fittings (§§ 4a.207-4a.216) shall be demonstrated.

§ 4a.298 *Fittings and attaching members.* Since the system of forces which designs a fitting does not necessarily include the forces which design the attaching members, all the forces acting in all the specified conditions shall be considered for every fitting. The strength of each part of a built-up fitting shall be investigated and proper allowance shall

be made for the effects of eccentric loading when initially present or when introduced by deflection of the structure under load.

§ 4a.299 *Bolts*. The allowable bearing load assumed for the threaded portion of a bolt shall not exceed 25 percent of the rated shear strength of the bolt.

SUBPART E—DETAIL DESIGN AND CONSTRUCTION

SOURCE: §§ 4a.301 to 4a.513 contained in Civil Air Regulations, May 31, 1938, as amended by Amendment 75, 5 F. R. 3946, except as noted following sections affected.

§ 4a.301 *General*. The primary structure and all mechanisms essential to the safe operation of the airplane shall not incorporate design details which experience has shown to be unreliable or otherwise unsatisfactory. The suitability of all design details shall be established to the satisfaction of the Administrator. Certain design features which have been found to be essential to the airworthiness of an airplane are specified in this subpart and shall be observed.

§ 4a.301-1 *Combustion heaters* (CAA rules which apply to § 4a.301). See § 4b.445-1 of this chapter.

[Supp. 4, 14 F. R. 3305]

MATERIALS, WORKMANSHIP, AND FABRICATION METHODS

§ 4a.302 *Materials and workmanship*. The primary structure shall be made from materials which experience or conclusive tests have proved to be uniform in quality and strength and to be otherwise suitable for airplane construction. Workmanship shall be of sufficiently high grade as to insure proper continued functioning of all parts.

§ 4a.303 *Fabrication methods*. The methods of fabrication employed in constructing the primary structure shall be such as to produce a uniformly sound structure which shall also be reliable with respect to maintenance of the original strength under reasonable service conditions.

§ 4a.304 *Gluing*. Gluing may be used except in cases where inferior joints might result or where proper protection from moisture cannot be shown.

§ 4a.305 *Torch welding*. Torch welding of primary structural parts may be used only for ferrous materials and for such other materials shown to be suitable therefor.

§ 4a.306 *Electric welding*. Electric arc, spot, or seam welding may be used in the primary structure when specifically approved by the Administrator for the application involved. Requests for approval of the use of electric welding shall be accompanied by information as to the extent to which such welding is to be used, drawings of the parts involved, apparatus employed, general methods of control and inspection, and references to test data substantiating the strength and suitability of the welds obtained.

§ 4a.307 *Brazing and soldering*. The use of brazing and soldering in joining parts of the primary structure is prohibited except that brazing may be used

in special cases when the suitability of the method and application can be definitely established to the satisfaction of the Administrator.

§ 4a.308 *Protection*. All members of the primary structure shall be suitably protected against deterioration or loss of strength in service due to corrosion, abrasion, vibration, or other causes. This applies particularly to design details and small parts. In seaplanes special precautions shall be taken against corrosion from salt water, particularly where parts made from different metals are in close proximity. All exposed wood structural members shall be given at least two protective coatings of varnish or approved equivalent. Built-up box spars and similar structures shall be protected on the interior by at least one coat of varnish or approved equivalent and adequate provisions for drainage shall be made. Due care shall be taken to prevent coating of the gluing surfaces.

§ 4a.309 *Inspection*. Inspection openings of adequate size shall be provided for such vital parts of the aircraft as require periodic inspection.

JOINTS, FITTINGS, AND CONNECTING PARTS

§ 4a.312 *Joints, fittings, and connecting parts*. In each joint of the primary structure the design details shall be such as to minimize the possibility of loosening of the joint in service, progressive failure due to stress concentration, and damage caused by normal servicing and field operations.

CROSS REFERENCE: For multiplying factors of safety required, see § 4a.208.

§ 4a.313 *Bolts, pins, and screws*. All bolts and screws in the structure shall be of uniform material of high quality and of first-class workmanship. Machine screws shall not be used in the primary structure unless specifically approved for such use by the Administrator. The use of an approved locking device or method is required for all bolts, pins, and screws.

§ 4a.314 *Wood screws*. The use of wood screws in the primary structure is prohibited except in special cases when the suitability of the particular application is proved to the satisfaction of the Administrator.

§ 4a.315 *Eyebolts*. Special eyebolts and similar bolts shall have a fillet between the head and the shank of at least one-fourth the diameter of the bolt when used in control surfaces or at other locations where they might be subjected to bending or vibration.

§ 4a.316 *Castings*. Castings used in the primary structure shall incorporate the multiplying factor of safety specified in § 4a.209 and shall be of such material and design as to insure the maximum degree of reliability and freedom from defects. The Administrator has the right to prohibit the use of castings where such use is deemed to be unwarranted.

[CAR, May 31, 1938, as amended by Amdt. 75, 5 F. R. 3946]

TIE-RODS AND WIRES

§ 4a.319 *Tie-rods and wires*. The minimum size of tie-rod which may be

used in primary structure is No. 6-40. The corresponding minimum allowable size of single-strand hard wire is No. 13 (0.072-inch diameter).

§ 4a.320 *Wire terminals*. The assumed terminal efficiency of single-strand hard wire shall not be greater than 85 percent.

§ 4a.321 *Wire anchorages*. A fitting attached to a wire or cable up to and including the 3,400-pound size shall have at least the rated strength of the wire or cable, and the multiplying factor of safety for fitting (§ 4a.208) is not required in such cases. In the case of fittings to which several tie-rods or wires are attached, this requirement applies separately to each portion of the fitting to which a tie-rod or wire is attached, but does not require simultaneous application of rated wire loads. The end connections of brace wires shall be such as to minimize restraint against bending or vibration.

§ 4a.322 *Counter wire sizes*. (See also §§ 4a.211, 4a.212.) In a wire-braced structure the wire sizes shall be such that any wire can be rigged to at least 10 percent of its rated strength without causing any other wire to be loaded to more than 20 percent of its rated strength. As used here "rated strength" refers to the wire proper, not the terminal.

FLUTTER PREVENTION

§ 4a.326 *General flutter prevention measures*. When he deems it necessary in the interest of safety, the Administrator may require special provisions against flutter. For specific requirements see §§ 4a.264, 4a.336, 4a.449, 4a.450, 4a.451, 4a.452, 4a.465, 4a.466 and 4a.680.

[Amdt. 75, 5 F. R. 3946, as amended by amdt. 04-2, 8 F. R. 13999]

DETAIL DESIGN OF WINGS

§ 4a.329 *External bracing*. When streamline wires are used for external lift bracing they shall be double unless the design complies with the lift-wire-cut condition specified in § 4a.95. (See also § 4a.210.)

§ 4a.330 *Wire-braced monoplanes*. If monoplane wings are externally braced by wires only, the right and left sides of the bracing shall be independent of each other so that an unsymmetrical load from one side will not be carried through the opposite wires before being counteracted, unless the design complies with the following conditions:

(a) The minimum true angle between any external brace wire and a spar is 14 degrees.

(b) The counter (landing) wires are designed to remain in tension at least up to the limit load.

(c) The landing and flying wires are double.

§ 4a.331 *Lift trusses*. Multiple-strand cable shall not be used in lift trusses.

§ 4a.332 *Jury struts*. When clamps are used for attachment of jury struts to lift struts, the design shall be such as to prevent misalignment or local crushing of the lift strut.

§ 4a.333 *Wing beams.* Provisions shall be made to reinforce wing beams against torsional failure, especially at the point of attachment of lift struts, brace wires, and aileron hinge brackets.

§ 4a.334 *Wing beam joints.* Joints in metal beams (except pinned joints) and joints in mid-bays of wood beams shall maintain 100 percent efficiency of the beam with respect to bending, shear, and torsion.

§ 4a.335 *Drag truss.* (a) Fabric-covered wing structures having a cantilever length of overhang such that the ratio of span of overhang to chord at root of overhang is greater than 1.75 shall have a double system of internal drag trussing spaced as far apart as possible, or other means of providing equivalent torsional stiffness. In the former case counter wires shall be of the same size as the drag wires. (See also § 4a.212.)

(b) Multiple-strand cable shall not be used in drag trusses unless such use is substantiated to the satisfaction of the Administrator.

§ 4a.336 *Aileron and flap attachments.* Aileron and flap attachment ribs or brackets shall be rigidly constructed and firmly attached to the main wing structure in order to reduce wing flutter tendencies.

§ 4a.337 *Internally-braced biplanes.* Internally braced biplanes shall be provided with N or I struts to equalize deflections, and the effect of such struts shall be considered in the stress analysis.

§ 4a.338 *Fabric covering.* Fabric covering shall comply with the requirements of § 4a.302 and shall be attached in a manner which will develop the necessary strength, with due consideration for slipstream effects. (See § 4a.252.)

§ 4a.338-1 *Aircraft fabric (CAA rules which apply to § 4a.338).* See §§ 4b.302-1 and 4b.302-2 of this subchapter. [Supp. 1, 13 F. R. 7725]

§ 4a.339 *Metal-covered wings.* The detail design of such wings shall incorporate suitable provision against buckling or wrinkling of metal covering as specified in §§ 4a.62, 4a.252.

DETAIL DESIGN OF TAIL AND CONTROL SURFACES

§ 4a.445 *Installation.* Movable tail surfaces shall be so installed that there is no interference between the surfaces or their bracing when any one is held in its extreme position and any other is operated through its full angular movement.

§ 4a.446 *Stops.* When an adjustable stabilizer is used, stops shall be provided at the stabilizer to limit its movement, in the event of failure of the adjusting mechanism, to a range equal to the maximum required to balance the airplane.

[CAR, May 31, 1938, as amended by Amdt. 04-2, 8 F. R. 13999]

§ 4a.447 *Elevator trailing edge tab systems.* Elevator trailing edge tab systems shall be equipped with stops which limit the tab travel to values not in excess of those provided for in the structural report. This range of tab movement

shall be sufficient to balance the airplane under the conditions specified in § 4a.677. [Amdt. 5, 4 F. R. 1170]

§ 4a.448 *Hinges.* (a) Hinges of the strap type bearing directly on torque tubes are permissible only in the case of steel torque tubes which have a multiplying factor of safety as specified in § 4a.213. In other cases sleeves of suitable material shall be provided for bearing surfaces.

(b) Clevis pins may be used as hinge pins provided that they are made of material conforming with, or the equivalent of, SAE Specification 2330.

§ 4a.449 *Elevators.* When separate elevators are used they shall be rigidly interconnected.

§ 4a.450 *Dynamic and static balance.* All control surfaces shall be dynamically and statically balanced to the degree necessary to prevent flutter at all speeds up to the design gliding speed.

[Amdt. 5, 4 F. R. 1171]

§ 4a.451 *Wing flaps.* Flaps shall be so installed as not to induce flutter or appreciable buffeting.

§ 4a.452 *Tab.* The installation of trim and balancing tabs shall be such as to prevent the development of any free motion of the tab. When trailing edge tabs are used to assist in moving the main surface (balancing tabs), the areas and relative movements shall be so proportioned that the main surface is not overbalanced at any time.

[Amdt. 5, 4 F. R. 1171]

DETAIL DESIGN OF CONTROL SYSTEMS

§ 4a.459 *Installation.* All control systems and operating devices shall be so designed and installed as to provide reasonable ease of operation by the crew and so as to preclude the probability of inadvertent operation, jamming, chafing, interference by cargo, passengers, or loose objects, and the slapping of cables against parts of the airplane. All pulleys shall be provided with satisfactory guards.

[Amdt. 56, 5 F. R. 2100]

§ 4a.460 *Stops.* All control systems shall be provided with stops which positively limit the range of motion of the control surfaces. Stops shall be capable of withstanding the loads corresponding to the design conditions for the control system.

§ 4a.461 *Joints.* Bolts with castellated nuts safetied with cotter pins or with an approved type of self-locking nut shall be used throughout the control system, except that the use of clevis pins in standard cable ends, thimbles, and shackles is satisfactory for light airplanes.

[CAR, May 31, 1938, as amended by Amdt. 04-2, 8 F. R. 13999]

§ 4a.462 *Welds.* Welds shall not be employed in control systems to carry tension without reinforcement from rivets or bolts.

§ 4a.463 *Flap controls.* The flap operating mechanism shall be such as to prevent sudden, inadvertent, or automatic

opening of the flap at speeds above the design speed for the extended flap conditions. The time required to fully extend or retract flaps shall not be less than 15 seconds, unless it can be demonstrated to the satisfaction of the Administrator that the operation of the flaps in a lesser time does not result in unsatisfactory flight characteristics. Means shall be provided to retain flaps in their fully retracted position and to indicate such position to the pilot.

§ 4a.464-T *Flap controls.* (a) For transport category airplanes, the flap control shall provide means for bringing the flaps from any position within the operating range to any one of three positions, designated as landing, approach, and take-off positions, or to the fully retracted position, by placing the primary flap control in a single setting marked as corresponding to each such flap position, the flaps thereupon moving directly to the desired position without requiring further attention. If any extension of the flaps beyond the landing position is possible, the flap control shall be clearly marked to identify such range of extension.

(b) The landing position, approach position, and take-off position, or any of them, may be made variable with altitude or weight by means of a secondary flap control provided for that purpose. Such a secondary control, if provided, shall operate independently of the primary control and in such manner that when it has been adjusted (for the effect of weight or altitude), the necessary flap position can thereafter be obtained by placing the primary flap control in the desired position. The secondary control shall be so designed and marked as to be readily operable by the crew.

(c) The rate of flap retraction shall be such as to permit compliance with 4a.752-T.

[Amdt. 04-4, 7 F. R. 984]

§ 4a.465 *Tab controls.* (a) Tab controls shall be irreversible and nonflexible, unless the tab is statically balanced about its hinge line. Proper precautions shall be taken against the possibility of inadvertent or abrupt tab operation and operation in the wrong direction.

(b) When adjustable elevator tabs are used for the purpose of trimming the airplane, a tab position indicator shall be installed, and means shall be provided for indicating to the pilot a range of adjustment suitable for safe take-off and the directions of motion of the control for nose-up and nose-down motions of the airplane.

§ 4a.466 *Spring devices.* The use of springs in the control system either as a return mechanism or as an auxiliary mechanism for assisting the pilot (bungee device) is prohibited except under the following conditions:

(a) The airplane shall be satisfactorily maneuverable and controllable and free from flutter under all conditions with and without the use of the spring device.

(b) In all cases the spring mechanism shall be of a type and design satisfactory to the Administrator.

(c) Rubber cord shall not be used for this purpose.

§ 4a.467 *Single-cable controls.* Single-cable controls are prohibited except in special cases in which their use can be proved to be satisfactory.

§ 4a.468 *Control system locks.* When a device is provided for locking a control surface while the aircraft is on the ground or water, compliance with the following requirements shall be shown.

(a) The locking device shall be so installed as to positively prevent taxiing the aircraft faster than 20 miles per hour, either intentionally or inadvertently, while the lock is engaged.

(b) Means shall be provided to preclude the possibility of the lock becoming engaged during flights.

§ 4a.469-T *Trim controls.* For transport category airplanes, the trimming devices shall be capable of continued normal operation in spite of the failure of any one connecting or transmitting element in the primary control system. Trim controls shall operate in the plane and with the sense of the motion of the airplane which their operation is intended to produce.

[Amdt. 04-5, 7 F. R. 984]

DETAIL DESIGN OF LANDING GEAR

§ 4a.475 *Shock absorption.* All landing gear (including tail gear installations) shall be provided with shock-absorbing systems which will permit the airplane to be landed under the conditions specified in §§ 4a.148 (b), 4a.152 without exceeding the ultimate load used in the analysis of any landing gear member. (See § 4a.278 for proof of absorption capacity.) If the design of the shock-absorbing system is such that the above method of specifying the required energy absorption capacity appears to give irrational results, an alternate method will be considered upon presentation of pertinent data.

§ 4a.476 *Shock-absorbing systems.* The shock-absorbing systems employed shall incorporate suitable means for absorbing the shocks developed in taxiing or running over rough ground.

§ 4a.477 *Wheels.* Main landing gear wheels shall be of a type or model certificated by the Administrator in accordance with the provisions of Part 15 of this subchapter and shall not be subjected to static loads in excess of those for which they are certificated. Tail wheels may be of any type or model and are not certificated. Nose wheels are subject to special rulings to be made by the Administrator.

§ 4a.478 *Main landing gear wheels.* For the purpose of the regulations in this part main landing gear wheels are considered as those nearest the airplane center of gravity with respect to fore-and-aft location.

§ 4a.479 *Tail and nose wheels.* For the purpose of the regulations in this part, a tail wheel is considered as one which supports the tail of a conventional airplane in the three-point landing attitude. A nose wheel is considered to be a wheel supporting the nose of the airplane when the two main wheels are located behind the center of gravity.

§ 4a.480 *Tires.* A landing gear wheel may be equipped with any make or type of tire, provided that the tire is a proper fit on the rim of the wheel and provided that the tire rating of the Airplane Tire Committee of the Tire and Rim Association is not exceeded.

§ 4a.481 *Tire markings.* When specially constructed tires are used to support an airplane, the wheels shall be plainly and conspicuously marked to that effect. Such markings shall include the make, size, number of plies, and identification marking of the proper tire.

§ 4a.482 *Retracting mechanism.* (a) When retractable landing wheels are used visual means shall be provided for indicating to the pilot, at all times, the position of the wheels. Separate indicators for each wheel are required when each wheel is separately operated unless a single indicator is obviously satisfactory. In addition, landplanes shall be provided with an aural or equally effective indicator which shall function continuously after the throttle is closed until the gear is down and locked.

(b) A positive lock shall be provided for the wheels in the extended position, unless a rugged irreversible mechanism is used.

(c) Manual operation of retractable landing gears shall be provided for.

[Amdt. 5, 4 F. R. 1171]

§ 4a.483-T *Brakes.* Transport category airplanes shall be equipped with brakes certificated in accordance with the provisions of Part 15 of this subchapter, for the maximum certificated landing weight at sea level and the power-off stalling speed, V_{SO} , as defined in § 4a.739-T. The brake system for such airplanes shall be so designed and constructed that in the event of a single failure in any connecting or transmitting element in the brake system, or the loss of any single source of hydraulic or other brake operating energy supply, it shall be possible, as shown by suitable test or other data, to bring the airplane to rest under the conditions specified in § 4a.750-T with a mean negative acceleration during the land roll of at least 50 percent of that obtained in determining the landing distance under that section.

[Amdt. 04-6, 7 F. R. 985 as amended by Amdt. 04-2, 8 F. R. 13999]

HULLS AND FLOATS

§ 4a.488 *Hulls and floats.* (See also §§ 4a.497 through 4a.513.)

§ 4a.489 *Buoyancy (main seaplane floats).* (a) Main seaplane floats shall have a buoyancy in excess of that required to support the gross weight of the airplane in fresh water as follows:

(1) 80 percent in the case of single floats.

(2) 90 percent in the case of double floats.

(b) Main seaplane floats for use on aircraft of 2,500 pounds or more maximum authorized weight shall contain at least five watertight compartments of approximately equal volume. Main seaplane floats for use on aircraft of less than 2,500 pounds maximum authorized

weight shall contain at least four such compartments.

§ 4a.490 *Buoyancy (boat seaplanes).* The hulls of boat seaplanes and amphibians shall be divided into watertight compartments in accordance with the following requirements:

(a) In aircraft of 5,000 pounds maximum authorized weight or more the compartments shall be so arranged that, with any two adjacent compartments flooded, the hull and auxiliary floats (and tires, if used) will retain sufficient buoyancy to support the gross weight of the aircraft in fresh water.

(b) In aircraft of 1,500 to 5,000 pounds maximum authorized weight the compartments shall be so arranged that, with any one compartment flooded, the hull and auxiliary floats (and tires, if used) will retain sufficient buoyancy to support the maximum authorized weight of the aircraft in fresh water.

(c) In aircraft of less than 1,500 pounds maximum authorized weight watertight subdivision of the hull is not required.

(d) Bulkheads may have watertight doors for the purpose of communication between compartments.

§ 4a.491 *Water stability.* Auxiliary floats shall be so arranged that when completely submerged in fresh water, they will provide a righting moment which is at least 1.5 times the upsetting moment caused by the aircraft being tilted. A greater degree of stability may be required in the case of large flying boats, depending on the height of the center of gravity above the water level, the area and location of wings and tail surfaces, and other considerations.

§ 4a.492 *Float design.* In designing the bow portion of floats and hulls suitable provision shall be made for the effects of striking floating objects.

FUSELAGE AND CABINS

§ 4a.497 *Provision for turn-over.* The fuselage and cabins shall be designed to protect the passengers and crew in the event of a complete turn-over and adequate provision shall be made to permit egress of passengers and crew in such event. The requirements of this section may be suitably modified when the possibility of a complete turn-over in landing is remote.

[Amdt. 5, 4 F. R. 1171]

§ 4a.498 *External door.* Closed cabins on all aircraft carrying passengers shall be provided with at least one adequate and easily accessible external door.

§ 4a.499 *Location of passenger door.* No passenger door shall be located in the plane of rotation of an inboard propeller, nor within 5 degrees thereof as measured from the propeller hub.

[Amdt. 5, 4 F. R. 1171]

§ 4a.500 *Exits.* Closed cabins on aircraft carrying more than 5 persons shall be provided with emergency exits, in addition to the one external door required by § 4a.498, consisting of movable windows or panels or of additional external doors which provide a clear and unobstructed opening, the minimum di-

mensions of which shall be such that a 19-inch by 26-inch ellipse may be completely inscribed therein. The location and the method of operation of emergency exits shall be approved by the Administrator. If the pilot is in a compartment separate from the cabin, passage through such compartment shall not be considered as an emergency exit for the passengers. The number of emergency exits required is as follows:

(a) Aircraft with a total seating capacity of more than 5 persons, but not in excess of 15, shall be provided with at least one emergency exit or one suitable door in addition to the main door specified in § 4a.498. This emergency exit, or second door, shall be on the opposite side of the cabin from the main door. If desired, an additional emergency exit may be provided in the top of the cabin, but such an installation shall not obviate the necessity for an exit on each side.

(b) Aircraft with a seating capacity of more than 15 persons shall be provided with an additional emergency exit or door either in the top or side of the cabin for every additional 7 persons or fraction thereof above 15, except that not more than 4 exits, including doors, will be required if the arrangement and dimensions are suitable for the purpose intended.

[CAR, May 31, 1938, as amended by Amdt. 48, 5 F. R. 1836]

PILOT COMPARTMENT

§ 4a.501 *Construction.* The pilot compartment shall be so constructed as to afford suitable ventilation and adequate vision to the pilot under normal flying conditions. In cabin aircraft the windows shall be so arranged that they may be readily cleaned or easily opened in flight to provide forward vision for the pilot. The ventilation requirements of § 4a.510 shall also apply to the pilot compartment.

§ 4a.502 *Location.* The pilot and the primary control units, excluding cables and control rods, shall be so located with respect to the propellers that no portion of the pilot or controls lies in the region between the plane of rotation of any propeller and the surface generated by a line passing through the center of the propeller hub and making an angle of 5 degrees forward or aft of the plane of rotation of the propeller.

§ 4a.503 *Identification plate.* A metal identification plate shall be permanently affixed in a visible location in the pilot compartment of each airplane. This plate shall contain the manufacturer's name, the date of manufacture, the manufacturer's serial number, and the model designation. The manufacturer shall specify the fuel capacity of each fuel tank on the manufacturer's identification plate, or on or adjacent to the fuel shut-off valves in the pilot compartment.

§ 4a.504 *Operation information and limitations.* Means shall be provided by which the operating personnel is suitably informed of all operation information

and limitations deemed necessary by the Administrator.

[Amdt. 48, 5 F. R. 1836, as amended by Amdt. 75, 5 F. R. 3946]

§ 4a.505 *Windows and windshields.* The windows and windshields of the pilot compartment in airplanes certificated for air transportation service shall be so arranged as to provide satisfactory forward vision and protection under all conditions and, to accomplish this, particular attention shall be paid to the following detail requirements:

(a) Sufficient data specifying the windshield material, number of laminations, binder if any, size and shape of panes, angle of panes to flight path, and method and rigidity of mounting, shall be forwarded to the Administrator for rulings as to the acceptability of the windshield from the standpoint of strength.

(b) Windshields shall be so installed that they can be easily opened in flight and shall be so arranged that the air stream and snow or rain are deflected across the opening, or to provide equivalent results.

(c) The pilot compartment shall be so constructed and arranged as to prevent glare or reflections which would interfere with the vision of either pilot, particularly while flying at night. The aircraft will be flown by a representative of the Administrator during hours of darkness to determine compliance with this provision.

§ 4a.506 *Leakage.* The pilot compartment in airplanes certificated for air transportation service shall be so constructed as to prevent any leakage into it when the airplane is flying in rain or snow.

§ 4a.507 *Seats.* When a second pilot is required (§ 61.121 of this subchapter) two seats shall be installed side by side in the pilot compartment of airplanes certificated for air transportation service from either of which the airplane shall be fully and readily controllable. If any difference exists as to convenience of the instruments and controls necessary for safe flight such difference should favor the left-hand seat. The left-hand seat shall be known as the first pilot's seat and the right-hand one as the second pilot's seat.

§ 4a.508 *Navigation instruments.* The navigation instruments for use by the pilot in airplanes certificated for air transportation service shall be so installed as to be easily visible to him with the minimum practicable deviation from his normal position and line of vision when he is looking out and forward along the flight path and they shall also be visible to the second pilot.

§ 4a.509 *Opening between pilot compartment and passengers' cabin.* All airplanes certificated for air transportation service shall be provided with a door or an adequate openable window between the pilot compartment and the passenger cabin. When a door is provided it shall be equipped with a locking means which shall prevent passengers from opening such door while in flight.

PASSENGER AND BAGGAGE COMPARTMENTS

§ 4a.510 *Passenger compartments.* A suitable ventilation system shall be provided which will preclude the presence of fuel fumes and dangerous traces of carbon monoxide in each passenger compartment.

§ 4a.511 *Passenger chairs.* Seats or chairs for passengers shall be securely fastened in place in both open and closed airplanes, whether or not the safety belt load is transmitted through the seat.

CROSS REFERENCES: For safety belt requirements, see Part 15 of this subchapter and § 4a.193.

§ 4a.512 *Baggage compartments.* Each baggage and mail compartment shall bear a placard stating the maximum allowable weight of contents, as determined by the structural strength of the compartment (§ 4a.194) and by flight test (§ 4a.725). Suitable means shall be provided to prevent the contents of mail and baggage compartments from shifting.

REINFORCEMENT NEAR PROPELLERS

§ 4a.513 *Reinforcement near propellers.* Surfaces near propeller tips shall be suitably stiffened against vibration and effects of ice thrown from the propeller.

CROSS REFERENCE: For clearance requirements, see § 4a.599.

SUBPART F—EQUIPMENT

SOURCE: §§ 4a.523 to 4a.581 contained in Civil Air Regulations, May 31, 1938, as amended by Amendment 75, 5 F. R. 3946; except as noted following sections affected.

§ 4a.523 *General.* The equipment required shall be dependent upon the type of operation for which certification is to be made. The requirements specified in this subpart shall be the basic equipment requirements and such additional equipment as may be specified in other sections of the Civil Air Regulations for specific special cases shall be supplemental hereto unless otherwise specified.

§ 4a.524 *Requirements.* Each item of equipment specified in the Civil Air Regulations shall be of a type and design satisfactory to the Administrator, shall be properly installed, and shall function to the satisfaction of the Administrator. Items of equipment for which certification is required shall have been certificated in accordance with the provisions of Part 15 of this subchapter or previous regulations.

§ 4a.525 *Life preserver or flotation device.* An approved life preserver or flotation device is one approved by the Administrator for such usage on sea-going vessels.

§ 4a.525-1 *Life rafts and life preservers (CAA rules which apply to § 4a.525).* See §§ 4b.811-1 and 4b.811-2 of this subchapter.

[Supp. 1, 13 F. R. 7725]

§ 4a.526 *Fire extinguishing apparatus.* Fire extinguishing apparatus approved by the Underwriters Laboratories is considered to be of an approved type.

NON-AIR CARRIER (NAC) AIRPLANES

§ 4a.531 *Non-air carrier (NAC) airplanes.* Airplanes which are certificated as non-air carriers shall have at least the equipment set forth in §§ 4a.532-4a.537.

[CAR, May 31, 1938, as amended by Reg. 601-A-1, 3 F. R. 2055]

§ 4a.531-2 *Life rafts and life preservers (CAA rules which apply to § 4a.531).* See §§ 4b.811-1 and 4b.811-2 of this subchapter.

[Supp. 1, 13 F. R. 7725]

§ 4a.532 *NAC landplanes; visual contact day flying (within 100 miles of a fixed base).* (a) One air-speed indicator.

CROSS REFERENCE: For installation requirements, see § 4a.559.

- (b) One altimeter.
- (c) A tachometer for each engine.
- (d) An oil-pressure gauge when an oil-pressure system is employed.
- (e) A water thermometer for each water-cooled engine.
- (f) An oil thermometer for each air-cooled engine.
- (g) A manifold-pressure gauge, or equivalent, for each altitude engine.
- (h) A fuel quantity gauge. (See § 4a.609 for requirements.)
- (i) Certificated safety belts for all passengers and members of the crew.

CROSS REFERENCES: For belt requirements, see Part 15 of this subchapter. For installation requirements, see § 4a.565.

(j) A portable fire extinguisher, which extinguisher shall be of an approved type, which shall have a minimum capacity, if carbon tetrachloride, of 1 quart, or, if carbon dioxide, of 2 pounds, or, if other, of equivalent effectiveness; except that any extinguisher of not less than half the above capacity may be used in an airplane equipped with an engine whose maximum rating is 40 horsepower or less. (See § 4a.566 for installation requirements.)

(k) Landing gear position indicator for retractable main landing gear. (See § 4a.482 for requirements.)

(l) A device for measuring or indicating the amount of oil in the tanks. (See § 4a.624 for requirements.)

(m) A first-aid kit.

(n) A logbook for the airplane and one for each engine. (See Part 1 of this subchapter for requirements.)

(o) Rigging information for airplanes with wire-braced wings, either in the form of a sketch or listed data, which shall include sufficient information to permit proper rigging.

[CAR, May 31, 1938, as amended by Amdt. 5, 4 F. R. 1171, Amdt. 116, 6 F. R. 2870]

§ 4a.532-1 *Portable water-solution type fire extinguishers (CAA rules which apply to § 4a.532(j)).* See § 4b.448-4 of this subchapter.

[Supp. 3, 14 F. R. 3196]

§ 4a.533 *NAC landplanes; visual contact day flying (unlimited distance).* Airplanes of this category shall have the equipment specified in § 4a.532 and, in addition, there shall be installed:

No. 136—16

(a) A magnetic compass.

CROSS REFERENCE: For installation requirements, see § 4a.562.

§ 4a.534 *NAC landplanes; visual contact night flying.* Airplanes of this category shall have the equipment specified in § 4a.533 and, in addition, there shall be installed:

(a) A set of certificated standard forward position lights in combination with a certificated tail light.

CROSS REFERENCES: For light requirements, see Part 15 of this subchapter. For installation requirements, see § 4a.578.

(b) Two electric landing lights if the aircraft is operated for hire: *Provided, however,* That only one such landing light shall be required for any airplane certificated for a weight of less than 1,500 pounds. (See § 4a.576 for installation requirements.)

(c) Certificated landing flares as follows, if the aircraft is operated for hire beyond an area within a circle with a radius of 3 miles drawn from the center of the airport of take-off (see Part 15 of this subchapter for flare requirements and § 4a.568 for installation requirements):

(1) Airplanes of 3,500 pounds maximum authorized weight or less—five Class 3 flares or three Class 2 flares.

(2) Airplanes of between 3,500 pounds and 5,000 pounds maximum authorized weight—four Class 2 flares.

(3) Airplanes of 5,000 pounds maximum authorized weight or more—two Class 1 flares or three Class 2 flares and one Class 1 flare.

(4) If desired, airplanes of less than 5,000 pounds maximum authorized weight may carry the flare equipment specified for heavier airplanes.

(d) A storage battery suitable as a source of energy supply for such lights and radio as are installed.

CROSS REFERENCE: For installation requirements, see § 4a.571.

(e) Radio equipment, if the aircraft is operated in a control zone (§ 60.13 of this subchapter), as follows: A radio range and weather broadcast receiver operating within the frequency range of 200 to 400 kilocycles. Under normal atmospheric conditions this receiver must be capable of receiving with a range of 100 miles intelligence emanated from a radio range or weather broadcast station the equivalent of a simultaneous Adcock range with scheduled broadcast installation.

(f) A set of spare fuses.

CROSS REFERENCE: For installation requirements, see § 4a.572.

[CAR, May 31, 1938, as amended by Amdt. 5, 4 F. R. 1171]

§ 4a.535 *NAC landplanes; instrument day flying.* Airplanes of this category shall have the equipment specified in § 4a.533 and, in addition, there shall be installed:

(a) Radio equipment: Same as § 4a.534 (e), whether the aircraft is operated for hire or not, and, in addition, a radio transmitter operated on 3105 kilocycles with a power output sufficient to establish communication at a distance of at least 100 miles under normal atmos-

pheric conditions. Additional frequencies may be employed subject to approval of the Federal Communications Commission.

(b) A gyroscopic rate-of-turn indicator.

(c) A bank indicator. (The rate-of-turn indicator may be combined in the bank indicator if desired.)

(d) A sensitive altimeter which shall be adjustable for changes in barometric pressure and compensated for changes in temperature.

(e) A clock with a sweep second hand.

(f) A storage battery suitable as a source of energy supply for the radio equipment installed.

CROSS REFERENCE: For installation requirements, see §§ 4a.571, 4a.573.

(g) A generator.

(h) A set of spare fuses.

CROSS REFERENCE: For installation requirements, see § 4a.572.

(i) A rate-of-climb indicator.

§ 4a.535-1 *Air-speed indicators, turn-and-bank indicators, direction indicators, climb indicators, and altimeters (CAA rules which apply to § 4a.531).* See §§ 4b.691-1, 4b.691-2, 4b.691-6, 4b.691-7, and 4b.691-8 of this subchapter.

[Supp. 1, 13 F. R. 7725]

§ 4a.536 *NAC landplanes; instrument night flying.* Airplanes of this category shall have the equipment specified in §§ 4a.534, 4a.535 combined. The storage battery shall be suitable as a source of energy supply for both the radio equipment and the lights.

§ 4a.537 *NAC seaplanes and amphibians.* The equipment requirements for seaplanes and amphibians shall be the same as specified for landplanes (§§ 4a.532-4a.536) except that seaplanes and amphibians shall not be certificated for operation over water out of sight of land unless they have at least the equipment specified in § 4a.533, and except that all certificated seaplanes and amphibians shall also have an approved life preserver or flotation device for each person for whom there is a seat, and except that all seaplanes and amphibians certificated for night operation shall also have a white anchor light.

§ 4a.537-1 *Life rafts and life preservers (CAA rules which apply to § 4a.537).* See §§ 4b.811-1 and 4b.811-2 of this subchapter.

[Supp. 1, 13 F. R. 7725]

CROSS REFERENCE: For installation requirements, see § 4a.575.

AIR CARRIER AIRPLANES; PASSENGER (ACP)

§ 4a.547 *Air carrier airplanes; passengers (ACP).* Airplanes certificated for use by an air carrier in passenger service shall have installed at least the equipment set forth in §§ 4a.548-4a.552.

[CAR, May 31, 1938, as amended by No. 601-A-1, 3 F. R. 2055]

§ 4a.548 *ACP landplanes; visual contact day flying.* The same as specified in § 4a.533 and, in addition, the following:

(a) An electrically heated pitot tube, or equivalent, for the air-speed indicator.

(b) One additional portable fire extinguisher of the type specified in § 4a.532 (j). (See § 4a.566 for installation requirements.)

(c) Fixed fire extinguishing apparatus of an approved type for each engine compartment.

(d) Type certificated radio equipment as specified in Part 40 of this subchapter.

(e) A set of spare fuses. (See § 4a.572 for installation requirements.)

(f) A rate-of-climb indicator.

(g) A storage battery: Same as § 4a.535 (f).

(h) A means for providing, without continuous manual operation, vision through the windshield adequate for executing take-offs and landings in rain.

[Amdt. 129, 7 F. R. 4691, amended by Amdt. 04-15, 7 F. R. 6240]

§ 4a.549 *ACP landplanes; visual contact night flying.* The same as specified in § 4a.548 and, in addition, the following:

(a) A set of certificated air carrier airplane position lights. The forward lights may be air carrier forward position lights or a combination of standard forward position lights and a set of auxiliary forward position lights. (See Part 15 of this subchapter for light requirements and § 4a.578 for installation requirements.)

(b) A storage battery of sufficient capacity for such lights and radio as are installed.

CROSS REFERENCE: For installation requirements, see §§ 4a.571, 4a.573.

(c) Two electric landing lights.

CROSS REFERENCE: For installation requirements, see § 4a.576.

(d) Certificated landing flares as follows: two Class 1 flares or three Class 2 flares and one Class 1 flare.

CROSS REFERENCES: For flare requirements, see Part 15 of this subchapter. For installation requirements, see § 4a.568.

(e) Instrument lights.

CROSS REFERENCE: For installation requirements, see § 4a.577.

(f) Cabin lights in all passenger cabins and compartments.

(g) A generator. (See § 4a.573 for requirements.)

(h) Radio equipment same as § 40.61.

[CAR, May 31, 1938, as amended by Amdt. 04-9, 7 F. R. 1709, Amdt. 04-2, 8 F. R. 13999]

§ 4a.550 *ACP landplanes; instrument day flying.* The same as specified in § 4a.548 except § 4a.548 (b) and, in addition, the following:

(a) A gyroscopic rate-of-turn indicator combined with a bank indicator.

(b) A gyroscopic instrument showing bank and pitch.

(c) A gyroscopic direction finder.

(d) Two sensitive-type altimeters, both of which shall be adjustable for changes in barometric pressure and compensated for changes in temperatures: Provided, That aircraft in use on or before January 1, 1939, and thereafter replacements and additions of aircraft of the same make and model may, for purposes of standardization, be deemed to have met this requirement, if there are

installed in each such aircraft one sensitive type altimeter and one standard type altimeter, provided each is adjustable for changes in barometric pressure and compensated for changes in temperature.

(e) A free air thermometer of the distance type with an indicating dial in the cockpit.

(f) A clock with a sweep second hand.

(g) A vacuum gauge, installed in the lines leading to instruments in paragraphs (a), (b) and (c) of this section.

(h) Type certificated radio equipment as specified in Part 40 of this subchapter.

(i) Means shall be provided to indicate icing conditions, or the probability thereof, in the carburetor if the de-icing device specified in § 4a.616 requires the manual manipulation of controls.

(j) A storage battery suitable as a source of energy supply for the radio equipment installed.

CROSS REFERENCE: For installation requirements, see §§ 4a.571, 4a.573.

(k) A generator.

CROSS REFERENCE: For installation requirements, see § 4a.573.

[CAR, May 31, 1938, as amended by Amdt. 5, 4 F. R. 1171, Amdt. 85, 6 F. R. 5145]

§ 4a.550-1 *Air-speed indicators, turn-and-bank indicators, bank-and-pitch indicators, direction indicators, climb indicators, altimeters, and air-speed tubes (CAA rules which apply to § 4a.550.)* See §§ 4b.691-1-4b.691-5, 4b.691-7, 4b.691-8, and 4b.691-10 of this subchapter.

[Supp. 1, 13 F. R. 7725]

§ 4a.551 *ACP landplanes; instrument night flying.* The same as specified in §§ 4a.549 and 4a.550 combined. The storage battery, in this case, shall be of sufficient capacity for all radio equipment and all lights installed.

§ 4a.552 *ACP seaplanes and amphibians.* The same as specified for landplanes. (§§ 4a.548-4a.551) and including the life preservers specified in § 4a.537, except that when certificated for night operation they shall also have installed the anchor light specified in § 4a.537.

INSTALLATION REQUIREMENTS

§ 4a.557 *Installation requirements.* The regulations in §§ 4a.558-4a.581 apply to the installation of specific items of equipment and are additional to the regulations of § 4a.523.

INSTRUMENT INSTALLATION

§ 4a.558 *Instruments.* The regulations in §§ 4a.559-4a.564 shall apply to the installation of instruments when such instruments are required by the regulations in this part.

§ 4a.559 *Air-speed indicator.* This instrument shall be so installed as to indicate true air speed at sea level with the maximum practicable accuracy, but the instrument error shall not be more than plus or minus 3 percent, except that it need not be less than plus or minus 5 miles per hour, at the level flight speed corresponding to the design power (§ 4a.38 (b)), at VL (§ 4a.40 (c)), or at

the maximum attainable level flight speed, whichever is lowest.

[Amdt. 5, 4 F. R. 1171]

§ 4a.560 *Power-plant instruments and controls.* See §§ 4a.642, 4a.643.

§ 4a.561 *Fuel quantity gauge.* See § 4a.609.

§ 4a.562 *Magnetic compass.* This instrument shall be properly damped and compensated and shall be located where it is least affected by electrical disturbances and magnetic influences.

§ 4a.563 *Navigational instruments.* Navigational instruments for use by the pilot shall be so installed as to be easily visible to him with the minimum practicable deviation from his normal position and line of vision when he is looking out and forward along the flight path, and they shall also be visible to the second pilot.

§ 4a.564 *Gyroscopic instruments.* All gyroscopic instruments shall derive their energy from engine-driven pumps or from auxiliary power units. Each source of energy supply and its attendant complete installation shall comply with the instrument manufacturer's recommendations for satisfactory instrument operation. On multiengine aircraft each instrument shall have two separate sources of energy, either one of which shall be capable of carrying the required load. Engine-driven pumps, when used, shall be on separate engines. The installation shall be such that failure of one source of energy or breakage of one line will not interfere with proper functioning of the instruments by means of the other source.

SAFETY EQUIPMENT INSTALLATION

§ 4a.565 *Safety belts.* Safety belts shall be so attached that no part of the attachment will fall at a load lower than that specified in § 4a.193.

§ 4a.566 *Fire extinguishers.* The portable fire extinguisher specified in § 4a.532 (j) shall be so installed as to be accessible to the passengers. The two portable fire extinguishers specified in § 4a.548 shall be so installed that one is readily available to the crew and the other is near the main external cabin door where it shall be readily available to passengers and ground personnel.

§ 4a.567 *Safety belt signal.* When a signal or sign is used to indicate to passengers the times that seat belts should be fastened, such signal or sign shall be located in a conspicuous place and so arranged that it can be operated from the seat of either pilot.

[Amdt. 129, 7 F. R. 4691]

§ 4a.568 *Landing flares.* Landing flares shall be releasable from the pilot compartment. Structural provision shall be made for the recoil loads.

§ 4a.569 *De-icers.* Positive means shall be provided for the deflation of all wing boots.

ELECTRICAL EQUIPMENT INSTALLATION

§ 4a.570 *General.* Electrical equipment shall be installed in accordance with accepted practice and suitably pro-

tected from fuel, oil, water, and other detrimental substances. Adequate clearance shall be provided between wiring and fuel and oil tanks, fuel and oil lines, carburetors, exhaust piping, and moving parts.

[Amdt. 48, 4 F. R. 1836]

§ 4a.571 Battery. Batteries shall be easily accessible and adequately isolated from fuel, oil, and ignition systems. Adjacent parts of the aircraft structure shall be protected with a suitable acid-proof paint if the battery contains acid or other corrosive substance and is not completely enclosed. If the battery is completely enclosed, suitable ventilation shall be provided. All batteries shall be so installed that spilled liquid will be suitably drained or absorbed without coming in contact with the airplane structure.

§ 4a.572 Fuses. Fuses shall be so located that they can readily be replaced in flight. They shall break the current in a generating system at a sufficiently small current flow adequately to protect the lights, radio equipment, and other parts of the circuit.

§ 4a.573 Generator. When a generator is specified it shall have sufficient capacity to carry the entire running load. Such generator shall be engine-driven unless an approved equivalent system is provided. Auxiliary power units will be approved in lieu of batteries and engine-driven generators, provided that they are at least two in number and that the supply system is capable of carrying the entire running load with any one unit out of action.

§ 4a.574 Running load. The running load shall be defined as the electric consumption of all lights, radio equipment, and other electrical devices, except those which are designed only for occasional intermittent use. Examples of devices regarded as intermittent are radio broadcasting equipment, landing lights, and electrically operated landing gears and wing flaps. Radio range signal receivers and all other lights are considered a part of the constant load.

§ 4a.575 Anchor lights. The anchor light specified for seaplanes and amphibians shall be so mounted and installed that, when the airplane is moored or drifting on the water, it will show a white light visible for at least 2 miles at night under clear atmospheric conditions.

[Amdt. 48, 4 F. R. 1836]

§ 4a.576 Landing lights. Electric landing lights shall be so installed on multiengine aircraft that at least one shall be not less than 10 feet to the right or left of the first pilot's seat and beyond the swept disk of the outermost propeller. On single-engine aircraft such lights shall be so installed that no visible portion of the swept disk of the propeller, if of the tractor type, is illuminated thereby. Individual switches for each light shall be provided in the pilot compartment.

[Amdt. 5, 4 F. R. 1171]

§ 4a.577 Instrument lights. Instrument lights shall be so installed as to

provide sufficient illumination to make all flight instruments easily readable and shall be equipped with rheostat control for dimming unless it can be shown that a nondimming light is satisfactory.

§ 4a.578 Position lights. Position lights shall be installed so that, with the airplane in normal flying position, the forward red position light is displayed on the left side and the forward green position light on the right side, each showing unbroken light between two vertical planes whose dihedral angle is 110 degrees when measured to the left and right, respectively, of the airplane from dead ahead. Such forward position lights shall be spaced laterally as far apart as practicable. One rear position light shall be installed on the airplane at the rear and as far aft as possible and shall show a light visible aft throughout a dihedral angle of 140 degrees bisected by a vertical plane through the longitudinal axis of the airplane. Such light shall emit (a) in the case of a non-air carrier airplane, either a continuous white light as specified in § 15.20 (b) (5) of this subchapter, or alternate red and white flashes as specified in § 15.20 (b) (6) of this subchapter, and (b) in the case of an air carrier airplane, alternate red and white flashes as specified in § 15.20 (b) (6) of this subchapter. In lieu of such a single flashing rear position light, an airplane may carry two rear position lights, one red and one white, spaced as closely as possible to each other and in combination emitting the red and white flashes specified in § 15.20 (b) (6) of this subchapter.

[Amdt. 04-10, 7 F. R. 1709 as amended by Amdt. 04-1, 9 F. R. 2772, Amdt. 04-2, 9 F. R. 11462]

§ 4a.578-1 Position light flashers (CAA rules which apply to § 4a.578). See § 4b.776-1 of this subchapter.

[Supp. 3, 14 F. R. 3196]

§ 4a.579 Master switch. Electrical installations shall incorporate a master switch easily accessible to a member of the crew.

MISCELLANEOUS EQUIPMENT INSTALLATION

§ 4a.580 Seats. Seats or chairs, even though adjustable, in open or closed airplanes, shall be securely fastened in place whether or not the safety belt load is transmitted through the seat.

§ 4a.581 Accessories. Engine-driven accessories on multiengine aircraft shall be distributed among two or more engines.

SUBPART G—POWER-PLANT INSTALLATION ENGINES

SOURCE: §§ 4a.591 to 4a.661 contained in Civil Air Regulations May 31, 1938, as amended by Amendment 75, 5 F. R. 3946, except as noted following sections affected.

§ 4a.591 Engines. Engines shall be of a type and design which has been type certificated, or found eligible for use in certificated aircraft, in accordance with the requirements of Part 13 of this subchapter or shall have been approved as airworthy in accordance with previous regulations.

[Amdt. 116, 6 F. R. 2870]

PROPELLERS

§ 4a.597 Propellers. Propellers shall be of a type and design which has been certificated as airworthy in accordance with the requirements of Part 14 of this subchapter or shall have been approved as airworthy in accordance with previous regulations, except that wood propellers of a conventional type for use in light airplanes need not be certificated. In certain cases maximum engine bore limitations are also assigned to propellers. Propellers may be used on any engine provided that the certified power ratings, speed ratings, and bore of the engine are not in excess of the limitations of the propeller as certificated, and further provided that the vibration characteristics of the combination are satisfactory to the Administrator.

[CAR, May 31, 1938, as amended by Amdt. 04-2, 8 F. R. 13999]

§ 4a.598 Controllable pitch. The control mechanism shall be designed and equipped with a positive stop which shall limit the minimum pitch so that the take-off crankshaft speed for which the aircraft is certificated is not exceeded during take-off with take-off power unless it is necessary to so locate the stop that a higher crankshaft speed may be used in an emergency. The means provided for controlling the pitch shall be so arranged as to minimize the attention required from a pilot to prevent the engines from exceeding their crankshaft speed limitations under any flight condition.

§ 4a.599 Propeller clearance. Propellers shall have a minimum ground clearance of 9 inches when the airplane is in a horizontal position with the landing gear deflected as it would be under the maximum authorized weight of the airplane. Propellers on seaplanes shall clear the water by at least 18 inches when the seaplane is at rest under the maximum authorized load condition. A clearance of at least 1 inch shall be provided between the tips of the propellers and any part of the structure.

FUEL SYSTEMS

§ 4a.605 Capacity and feed. The fuel capacity shall be at least 0.15 gallons per maximum (except take-off) horsepower for which the airplane is certificated. Air-pressure fuel systems shall not be used. Only straight gravity feed or mechanical pumping of fuel is permitted. The system shall be so arranged that the entire fuel supply may be utilized in the steepest climb and at the best gliding angle and so that the feed ports will not be uncovered during normal maneuvers involving moderate rolling or side slipping. The system shall also feed fuel promptly after one tank has run dry and another tank is turned on. If a mechanical pump is used, an emergency hand pump of equal capacity shall be installed and available for immediate use in case of a pump failure during take-off. Hand pumps of suitable capacity may also be used for pumping fuel from an auxiliary tank to a main fuel tank.

§ 4a.606 Tank installation. No fuel tank shall be placed closer to an engine than the remote side of a fire wall. At

least one-half inch clear air space shall be allowed between the tank and the fire wall. Spaces adjacent to the surfaces of the tank shall be ventilated so that fumes cannot accumulate or reach the crew or passengers in case of leakage. If two or more tanks have their outlets interconnected they shall be considered as one tank and the air space in the tanks shall also be interconnected to prevent differences in pressure at the air vents of each tank of sufficient magnitude to cause fuel flow between tanks. Mechanical pump systems shall not feed from more than one tank at a time except by special ruling from the Administrator.

§ 4a.607 *Tank construction.* Each fuel tank shall be provided with either a sump and drain located at the point which is lowest when the airplane is in a normal position on the ground or outlets at the bottom of the tank provided with large mesh finger strainers. If a sump is provided, the main fuel supply shall not be drawn from the bottom of this sump. If no sump is provided, the system drain shall be controllable from the pilot compartment and shall act as a tank drain. Each tank shall be suitably vented from the top portion of the air space. Such air vents shall be so arranged as to minimize the possibility of stoppage by dirt or ice formation. When large fuel tanks are used, the size of the vent tubes should be proportioned so as to permit rapid changes in internal air pressure to occur and thereby prevent collapse of the tanks in a steep glide or dive. Tanks of 10 gallons or more capacity shall be provided with internal baffles, unless suitable external support is provided to resist surging.

§ 4a.608 *Tank strength.* Fuel tanks shall be capable of withstanding an internal test pressure of $3\frac{1}{2}$ pounds per square inch without failure or leakage. Fuel tanks of large capacity which have a maximum fuel depth greater than 2 feet shall be investigated for the pressure developed during the maximum limit acceleration with full tanks. Tanks shall be so designed, and the rivets or welds so located, as to resist vibration failures or leakage.

§ 4a.609 *Gauge.* A satisfactory gauge shall be so installed on all airplanes as to readily indicate to a pilot or flight mechanic the quantity of fuel in each tank while in flight. When two or more tanks are closely interconnected and vented, and it is impossible to feed from each one separately, only one fuel-level gauge need be installed. If a glass gauge is used, it shall be suitably protected against breakage.

§ 4a.610 *Lines and fittings.* All fuel lines and fittings shall be of sufficient size so that under the pressure of normal operation the flow is not less than double the normal flow required for take-off engine power. A test for proof of compliance with this requirement shall be made. All fuel lines shall be so supported as to prevent excessive vibration and should be located so no structural loads can be applied. Bends of small radius and vertical humps in the lines shall be avoided. Copper fuel lines which have been bent shall be annealed before

installation. Parts of the fuel system attached to the engine and to the primary structure of the airplane shall be flexibly connected thereto. Flexible hose connections and fuel lines shall have metal liners or the equivalent. Fittings shall be of a type satisfactory to the Administrator.

§ 4a.611 *Strainers.* One or more strainers of adequate size and design, incorporating a suitable sediment trap and drain, shall be provided in the fuel line between the tank and the carburetor and shall be installed in an accessible position. The screen shall be easily removable for cleaning.

§ 4a.612 *Valves.* One or more positive and quick-acting valves that will shut off all fuel to each engine shall be within easy reach of the first pilot and the second pilot or of the flight mechanic. In the case of airplanes employing more than one source of fuel supply, suitable provision shall be made for independent feeding from each source.

§ 4a.613 *Dump valves.* When fuel tanks are equipped with dump valves, the operating mechanism for such valves shall be within convenient reach of the first pilot and the second pilot or of the flight mechanic. Dump valves shall be so installed as to provide for safe and rapid discharge of fuel.

§ 4a.614 *Drains.* One or more accessible drains shall be provided at the lowest point on the fuel systems to completely drain all parts of each system when the airplane is in its normal position on level ground. Such drains shall discharge clear of all parts of the airplane and shall be equipped with suitable safety locks to prevent accidental opening.

MISCELLANEOUS FUEL SYSTEM REQUIREMENTS

§ 4a.615 *Filler openings.* All filler openings in the fuel system shall be plainly marked with the capacity and the word "fuel". Provision shall be made to prevent any overflow from entering the wing or fuselage.

§ 4a.616 *Prevention of ice formation.* An adequate means shall be provided for preventing the formation of ice in the engine carburetors (see also § 4a.550 (i)).

[Amdt. 5, 4 F. R. 1171]

LUBRICATION SYSTEMS

§ 4a.621 *General.* Each engine shall have an independent oil supply. The oil capacity of the system shall be at least 1 gallon for every 25 gallons of fuel but shall not be less than 1 gallon for each 75 maximum (except take-off) rated horsepower of the engine or engines. A special ruling concerning the capacity will be made by the Administrator when oil may be transferred between engines in flight or when a suitable reserve is provided. The suitability of the lubrication system shall be demonstrated in flight tests in which engine temperature measurements are obtained. The system shall provide the engine with an ample quantity of oil at a temperature

suitable for satisfactory engine operation.

[Amdt. 04-1, 7 F. R. 7933]

§ 4a.622 *Tank installation.* Oil tanks shall be suitably vented and shall be provided with an expansion space which cannot be inadvertently filled with oil. Such expansion space shall be at least 10 percent of the total tank volume, except that it shall in no case be less than one-half gallon.

§ 4a.623 *Tank strength.* Oil tanks shall be capable of withstanding an internal test pressure of 5 pounds per square inch without failure or leakage. Tanks shall be so designed and the rivets or welds so located as to resist vibration failures and leakage.

§ 4a.624 *Gauge.* A suitable means shall be provided to determine the amount of oil in the system during the filling operation.

§ 4a.625 *Piping.* Oil piping shall have an inside diameter not less than the inside diameter of the engine inlet or outlet and shall have no splices between connections. Connections in the oil system shall be of a type satisfactory to the Administrator.

§ 4a.626 *Drains.* One or more accessible drains shall be provided at the lowest point on the lubricating systems to drain completely all parts of each system when the airplane is in its normal position on level ground. Such drains shall discharge clear of all parts of the airplane and shall be equipped with suitable safety locks to prevent accidental opening.

§ 4a.627 *Oil temperature.* A suitable means shall be provided for measuring the oil temperature at the engine inlet.

§ 4a.628 *Filler openings.* All filler openings in the oil system shall be plainly marked with the capacity and the word "oil".

COOLING SYSTEMS

§ 4a.633 *General.* The cooling system shall be of sufficient capacity to maintain engine temperatures within safe operating limits under all conditions of flight during a period at least equal to that established by the fuel capacity of the aircraft, assuming normal engine power and speeds. Compliance with this requirement shall be demonstrated in flight tests in which engine temperature measurements are obtained under critical flight conditions including flight with one or more engines inoperative.

§ 4a.634 *Radiators.* Radiators shall be so mounted as to reduce vibration and eliminate strains causing distortion.

§ 4a.635 *Piping.* Piping and connections shall conform to accepted standards and shall not transmit vibration to the radiator or the structure of the aircraft.

§ 4a.636 *Drains.* One or more accessible drains shall be provided at the lowest points on the cooling system to drain completely all parts of such system when the airplane is in its normal position on level ground. Such drains shall discharge clear of all parts of the airplane

and shall be equipped with suitable safety locks to prevent accidental opening.

§ 4a.637 *Filler openings.* All filler openings in the cooling system shall be plainly marked with the capacity of the system and the name of the proper cooling liquid.

POWER-PLANT INSTRUMENTS, CONTROLS, AND ACCESSORIES

§ 4a.642 *Instruments.* The engine instruments required are specified in Subpart F. The installation requirements for navigational instruments in § 4a.563 shall apply to tachometers and manifold pressure gauges. All other instruments shall be visible in flight to the pilot and copilot or to the flight mechanic. If the manifold pressure gauges and tachometers are not visible to the flight mechanic, he shall be provided with a duplicate set of these instruments.

§ 4a.643 *Controls.* All power-plant controls, including those of the fuel system, shall be plainly marked to show their function and method of operation.

§ 4a.644 *Throttle controls.* Throttle controls shall be easily accessible to both pilots and shall be so arranged as to afford a positive and immediately responsive means of controlling all engines separately or simultaneously. Flexible throttle control systems shall be of a certificated type. A forward movement shall open the throttle.

§ 4a.645 *Ignition switches.* Ignition switches shall be easily accessible to both pilots. A positive means for quickly shutting off all ignition of multiengine aircraft, by grouping of switches or otherwise, shall be provided.

§ 4a.646 *Propeller pitch controls.* Separate pitch controls shall be provided for each propeller.

§ 4a.647 *Accessories (air carrier planes).* (See § 4a.581.)

MANIFOLDING, COWLING, AND FIRE WALL

§ 4a.651 *General.* All manifolds, cowlings, and fire walls shall be so designed and installed as to reduce to a minimum the possibility of fire either during flight or following an accident and shall therefore comply with accepted practice in all details of installation not specified in this part.

§ 4a.652 *Manifolds.* Exhaust manifolds shall be constructed of suitable materials, shall provide for expansion, and shall be arranged and cooled so that local hot points do not form. Gases shall be discharged clear of the cowlings, airplane structure, and fuel system parts of drains. They shall not blow back on the carburetor air intake or the pilot or passengers, nor cause a glare ahead of the pilot at night. No exhaust manifold shall be located immediately adjacent to or under the carburetor or fuel system parts liable to leakage.

§ 4a.653 *Air intakes.* Carburetor air intakes shall be suitably drained and shall open completely outside the cowlings, unless the emergence of back-fire flames is positively prevented. The drain shall

not discharge fuel in the path of possible exhaust flames.

§ 4a.654 *Engine cowlings.* All cowlings around the power plant and on the engine side of the fire wall shall be made of metal and shall be so arranged that any accumulations of dirt, waste, or fuel may be observed without complete removal of the cowlings. It shall fit tightly to the fire wall, but openings may be provided if the airplane surface within 15 inches thereof is protected with metal or other suitable fireproofing material. The cowlings shall be completely and suitably drained in all attitudes of flight and on the ground, with separate drains provided for the parts of the fuel system liable to leakage. All such drains shall be so located as to prevent fuel or oil from dripping onto the exhaust manifold or any parts of the aircraft and from permeating any material of a cellular nature.

§ 4a.655 *Fire wall.* (a) A fire wall shall be provided unless the engine is mounted in an isolated nacelle with no fuel tanks. Such fire bulkhead shall be constructed in either of the following approved manners:

(1) A single sheet of terneplate not less than 0.028 inch thick.

(2) A single sheet of stainless steel not less than 0.015 inch thick.

(3) Two sheets of aluminum or aluminum alloy not less than 0.02" thick fastened together and having between them an asbestos paper or asbestos fabric sheet at least 1/8 inch thick.

(b) The fire wall shall completely isolate the engine compartment and shall have all necessary openings fitted with close-fitting grommets or bushings. Adjacent inflammable structural members shall be protected by asbestos or an equivalent insulating material, and provision shall be made for preventing fuel and oil from permeating it.

§ 4a.656 *Heating systems.* Heating systems involving the passage of cabin air over or in close proximity to engine exhaust manifolds shall not be used, unless adequate precautions are incorporated in the design to prevent the introduction of carbon monoxide into the cabin or pilot compartment. They shall be constructed of suitable materials, be adequately cooled, and be susceptible to ready disassembly for inspection.

MISCELLANEOUS POWER-PLANT REQUIREMENTS

§ 4a.661 *Materials.* Fuel, oil, and cooling systems shall be made of materials which, including their normal or inherent impurities, will not react chemically with any fuels, oils, or liquids that are likely to be placed in them.

SUBPART H—PERFORMANCE

SOURCE: §§ 4a.671 to 4a.760—T contained in Civil Air Regulations, May 31, 1938, as amended by Amdt. 75, 5 F. R. 3946, except as noted following sections affected.

§ 4a.671 *Performance requirements.* All airplanes shall comply with the performance requirements set forth in §§ 4a.680 and 4a.682. All airplanes except those certificated in the transport category shall comply with §§ 4a.672 through 4a.679, inclusive. Compliance with such performance requirements

shall be shown in standard atmosphere, at all weights up to and including the standard weight (§ 4a.37 (d)) and under all loading conditions within the center of gravity range certified (§ 4a.725): *Provided*, That demonstration of compliance with landing-speed requirements, and with those relating to take-off time and distance, may be limited to an intermediate range of center of gravity positions if it can be shown that it is possible for the airplane to continue flight with one engine inoperative, and that passengers or other load can be easily and rapidly shifted while in flight to permit the realization, at the pilot's discretion, of a center of gravity position within the range covered by this demonstration. There shall be no flight or handling characteristics which, in the opinion of the Administrator, render the airplane un-airworthy.

[Amdt. 04-12, 7 F. R. 1730 as amended by Amdt. 04-2, 8 F. R. 13999]

§ 4a.672 *Landing speeds.* The landing speed with power off, in standard calm air at sea level, shall not exceed a value determined as follows:

(a) Airplanes certificated for passenger carrying:

(1) 65 miles per hour for airplanes of 20,000 pounds standard weight or less,

(2) 70 miles per hour for airplanes of 30,000 pounds standard weight or more, and a linear variation with standard weight shall apply for airplanes between 20,000 and 30,000 pounds.

(b) Airplanes which are certificated for the carriage of goods only:

The above landing speed values may be increased 5 miles per hour.

§ 4a.673 *Take-off.* Take-off at sea level:

(a) Within 1,000 feet for land planes;

(b) Within 60 seconds in calm air for seaplanes.

[Amdt. 56, 5 F. R. 2100]

§ 4a.674 *Climb.* The average rate of climb for the first minute after the airplane leaves the take-off surface in accordance with § 4a.673, and the rate of steady climb at sea level with not more than maximum-except-take-off power, shall not be less in feet per minute than:

(a) *Land planes.* Eight times the measured power-off stalling speed in miles per hour with the flaps and landing gear retracted, or 300 feet per minute, whichever is greater;

(b) *Sea planes.* Six times the measured power-off stalling speed in miles per hour with the flaps retracted, or 250 feet per minute, whichever is greater.

[Amdt. 56, 5 F. R. 2100]

§ 4a.675 *Controllability and maneuverability.* All airplanes shall be controllable and maneuverable under all power conditions and at all flying speeds between minimum flying speed and the maximum certified speed. All airplanes shall have control adequate for an average landing at minimum landing speed with power off.

§ 4a.676 *Controllability at the stall.* With power off and with 75 percent maximum-except-take-off power, with flaps and landing gear in any position, the airplane shall have sufficient direc-

tional and lateral control so that when the airplane is stalled, the downward pitching motion following the stall shall occur prior to any uncontrollable roll or yaw. Any such pitching motion shall not be excessive and recovery to normal flight shall be possible by normal use of the controls after the pitching motion is unmistakably developed, without excessive loss of altitude.

[Amdt. 04-14, 7 F. R. 5037]

§ 4a.677 *Balance*. As used in the regulations in this part the term "balanced" refers to steady flight in calm air without exertion of control force by the pilot or automatic pilot. Lateral and directional balance is required at cruising speed which for this purpose shall be taken as 90 percent of the high speed in level flight. Longitudinal balance is required under the following flight conditions:

(a) *Power on*. In level flight, at all speeds between cruising speed and a speed 20 percent in excess of stalling speed. In a climb, at maximum (except take-off) horsepower and a speed 20 percent in excess of stalling speed.

(b) *Power off*. In a glide, at a speed not in excess of 140 percent of the maximum permissible landing speed or the placard speed with flaps extended, whichever is lower, under the forward center of gravity position approved with maximum authorized load and under the most forward center of gravity position approved, regardless of weight.

§ 4a.678 *Stability*. Under all power conditions all airplanes shall be longitudinally, laterally, and directionally stable. An airplane will be considered to be longitudinally stable if, in stability tests, the amplitude of the oscillations decreases.

§ 4a.679 *Spinning*. (Not applicable to airplanes certificated in the transport category). At any permissible combination of weight and center of gravity position obtainable with all or part of the design useful load, there shall be no excessive reversal of control forces during any possible spinning up to 6 turns. It shall be possible promptly to recover at any point in the spinning described above by using the controls in a normal manner for that purpose and without exceeding either the limiting air speed or the limit design normal acceleration for the airplane. It shall not be possible to obtain uncontrollable spins by means of any possible use of the controls: *Provided*, That compliance with the foregoing requirements with respect to spinning shall not be required for those airplanes:

(a) Permanently placarded "intentional spinning prohibited"; or
(b) Demonstrated to the satisfaction of the Administrator to be characteristically incapable of spinning.

[Amdt. 04-14, 7 F. R. 5037]

§ 4a.680 *Flutter and vibration*. Wings, tail surfaces, control surfaces, and primary structural parts shall be free from flutter or objectionable vibration in all normal attitudes or conditions of flight between the minimum flying speed and the maximum indicated air speed attained in official flight tests (see § 4a.708).

§ 4a.681-T *Flutter and vibration*. All parts of transport category airplanes shall be free from flutter or excessive vibration under all speed and power conditions appropriate to the operation of the airplane during take-off, climb, level flight, and landing, and during glide at speeds up to the maximum indicated air speed attained during official flight tests (see § 4a.708). There shall be no appreciable buffeting for any flap position at any speed in excess of 10 miles per hour above stalling speed for such position nor shall buffeting at lower speeds be so violent as to interfere with the pilot's control of the airplane or cause discomfort to its occupants.

[Amdt. 40-7, 7 F. R. 984]

§ 4a.682 *Ground and water characteristics*. Landplanes shall be maneuverable on the ground and shall be free from dangerous ground looping tendencies and objectionable taxiing characteristics. The seaworthiness and handling characteristics of seaplanes and amphibians shall be demonstrated by tests deemed appropriate by the Administrator.

CROSS REFERENCE: For water stability requirements, see § 4a.491.

MODIFIED PERFORMANCE REQUIREMENTS

§ 4a.687 *Modified performance requirements for multiengine airplanes not certificated in the transport category*. The weight of any multiengine airplane manufactured pursuant to a type certificate issued prior to January 1, 1941, may be increased beyond the values corresponding to the landing speed specified in § 4a.672 and take-off requirements of § 4a.673, subject to the following conditions:

(a) The increased weight shall be known as the provisional weight (§ 4a.37 (e)). The standard weight (§ 4a.37 (d)) shall be the maximum permissible weight for landing. The provisional weight shall be the maximum permissible weight for take-off.

(b) Compliance with all the airworthiness requirements except landing speed and take-off is required at the provisional weight, except that the provisional weight may exceed the design weight on which the structural loads for the landing conditions are based by an amount not greater than 15 percent: *Provided*, That the airplane is shown to be capable of safely withstanding the ground or water shock loads incident to taking off at the provisional weight.

(c) The airplane shall be provided with suitable means for the rapid and safe discharge of a quantity of fuel sufficient to reduce its weight from the provisional weight to the standard weight.

(d) In no case shall the provisional weight exceed a value corresponding to a landing speed of 5 miles per hour in excess of that specified in § 4a.672, a take-off distance of 1,500 feet in the case of landplanes, or a take-off time of 60 seconds in the case of seaplanes; nor shall any provisional weight authorized in respect to any type of airplane after January 1, 1945, exceed the value corresponding to a rate of climb of at least

180 feet per minute at an altitude of 5,000 feet with the critical engine inoperative, its propeller windmilling with the propeller control in a position which would allow the engine (if operating normally and within approved limits) to develop at least 50 percent of maximum-exception-take-off engine speed, all other engines operating at the take-off power available at such altitude, the landing gear retracted, center of gravity in the most unfavorable position permitted for take-off, and the flaps in the take-off position.

[Amdt. 04-3, 10 F. R. 3793]

PERFORMANCE TESTS

§ 4a.701 *General*. Compliance with the performance requirements in §§ 4a.671 through 4a.692 shall be demonstrated by means of suitable flight tests of the type airplane. Computations may be used to estimate the effects of minor changes. Additional information concerning the performance characteristics of air carrier airplanes is specified in § 4a.717. Such characteristics shall be determined by direct flight testing, or by methods combining basic flight tests and calculations. All performance characteristics shall be corrected to standard atmospheric conditions and zero wind. Methods of performance calculation and correction employed shall be subject to the approval of the Administrator.

§ 4a.702 *Flight test pilot*. (a) The applicant shall provide a person holding an appropriate commercial pilot certificate to make the flight tests, but a designated inspector of the Administrator may pilot the airplane during such parts of the tests as he may deem advisable.

(b) In the event that the applicant's test pilot is unable or unwilling to conduct any of the required flight tests, the tests shall be discontinued until the applicant furnishes a competent pilot.

§ 4a.703 *Parachutes*. Parachutes shall be worn by members of the crew during the flight tests.

§ 4a.704 *Reports*. The applicant shall submit to the inspector of the Administrator a report covering all computations and tests required in connection with calibration of flight instruments and correction of tests results to standard atmospheric conditions. The inspector will conduct any flight tests which appear to him to be necessary in order to check the calibration and correction report or to determine the airworthiness of the airplane.

§ 4a.705 *Loading conditions*. The loading conditions used in performance tests shall be such as to cover the range of loads and center of gravity positions for which the airplane is to be certificated.

§ 4a.706 *Use of ballast*. Ballast may be used to enable airplanes to comply with the flight requirements as to longitudinal stability, balance, and landing in accordance with the following provisions:

(a) Ballast shall not be used for this purpose in airplanes having a gross weight of less than 5,000 pounds nor in airplanes with a total seating capacity of less than seven persons.

(b) The place or places for carrying ballast shall be properly designed and installed and plainly marked.

(c) The loading schedule which will accompany each certificate issued for an airplane requiring special loading of this type shall be conspicuously posted in either the pilot compartment or in or adjacent to the ballast compartments, and strict compliance therewith will be required of the airplane operator.

[CAR, May 31, 1938, as amended by Amdt. 48, 5 F. R. 1836]

§ 4a.707 *Fuel to be carried.* When low fuel adversely affects balance or stability, the airplane shall be so tested as to simulate the condition existing when the amount of fuel on board does not exceed 1 gallon for every 12 maximum (except take-off) horsepower of the engine or engines installed thereon. When the engine is limited to a lower power, the latter shall be used in computing low fuel.

§ 4a.708 *Maximum air speed.* The flight tests shall include steady flight in relatively smooth air at the design gliding speed (V_g) for which compliance with the structural loading requirements (§§ 4a.72 through 4a.99) has been proved, except that they need not involve speeds in excess of $1.33 V_L$ (§ 4a.40 (c)): *Provided*, That the operation limits are correspondingly fixed (see § 4a.726). When high-lift devices having nonautomatic operation are employed, the tests shall also include steady flight at the design flap speed V_f (§ 4a.40 (f)), except that they need not involve speeds in excess of $2 V_M$ (see § 4a.40 (e)). In cases where the high-lift devices are automatically operated, the tests shall cover the range of speeds within which the devices are operative.

§ 4a.709 *One-engine-inoperative performance.* Multiengine airplanes shall be flight tested at such altitudes and weights as are necessary, in the opinion of the Administrator, to prepare accurate data to show climbing performance within the range of weight for which certification is sought, with the critical engine inoperative and each other engine operating at not more than maximum-except-take-off power. Such data when approved by the Administrator shall be kept in the airplane at all times during flight in a place conveniently accessible to the pilot.

[Amdt. 56, 5 F. R. 2101 as amended by Amdt. 75, 5 F. R. 3947]

§ 4a.710 *Air-speed indicator calibration.* In accordance with § 4a.559, the air-speed indicator of the type airplane shall be calibrated in flight. The method of calibration used shall be subject to the approval of the Administrator.

§ 4a.711 *Check of fuel system.* The operation of the fuel system shall be checked in flight to determine its effectiveness under low fuel conditions and after changing from one supply tank to another. (See § 4a.605.) For such tests low fuel is defined as approximately 15 minutes supply in each tank tested, at the maximum-except-take-off power certified.

AIR CARRIER AIRCRAFT PERFORMANCE CHARACTERISTICS

§ 4a.717 *Performance characteristics of air carrier aircraft.* No air carrier shall operate aircraft in scheduled air transportation unless data shall have been submitted to and approved by the Administrator, covering the determination of such performance characteristics, in addition to those specified in §§ 4a.671-4a.711, as are, in the opinion of the Administrator, necessary to determine the ability of such aircraft to safely perform the type of operation which the air carrier proposes to conduct. The method used for the determination of such ability shall be subject to the approval of the Administrator.

[Amdt. 26, 4 F. R. 3837 as amended by Amdt. 75, 5 F. R. 3947]

OPERATION LIMITATIONS

§ 4a.723 *Weight.* Non-air carrier airplanes may be certificated at a maximum authorized weight which is not sufficient to permit carrying simultaneously the full fuel and full pay load, provided that such weight shall be sufficient to provide a gasoline load of at least 0.15 gallon per certified maximum (except take-off) horsepower, with all seats occupied and with sufficient oil for this amount of fuel.

§ 4a.724 *Provisional weight (air carrier airplanes).* (See §§ 4a.687-4a.692.)

§ 4a.725 *Center of gravity limitations.* The maximum variation in the location of the center of gravity for which the airplane is certificated to be airworthy shall be established. Means shall be provided, when necessary in the opinion of the Administrator, by which the operator is suitably informed of the permissible loading conditions which result in a center of gravity within the certified range.

§ 4a.726 *Air-speed limitations.* Maximum operation limitations will be incorporated in the aircraft certificate and will specify the indicated air speeds which shall not be exceeded in level and climbing flight (§ 4a.40 (c)), in gliding and diving flight, and with flaps extended. The values in gliding flight and with flaps extended will be 10 percent less than the corresponding maximum air speeds attained in flight tests in accordance with § 4a.708.

[Amdt. 5, 4 F. R. 1170]

§ 4a.727 *Power - plant limitations.* Maximum operational limitations will be incorporated in the aircraft certificate and will specify power-plant outputs on take-off (§ 4a.187), in climbing flight, and for all operations other than take-off and climbing flight (§ 4a.38 (b)). The output, except for take-off, shall not exceed that corresponding to the maximum (except take-off) rating of the engine installed. For the above purposes no specified output will be in excess of that corresponding to the limits imposed by either the pertinent engine or propeller certification (see §§ 4a.25 and 4a.26).

[Amdt. 5, 4 F. R. 1170]

TRANSPORT CATEGORY AIRPLANE PERFORMANCE REQUIREMENTS

§ 4a.737-T *Performance requirements for transport category airplanes.* The following requirements shall apply in place of §§ 4a.672-4a.679.

[Amdt. 04-8, 7 F. R. 985, as amended by Amdt. 04-2, 8 F. R. 13999]

§ 4a.738-T *Minimum requirements for certification.* (a) An airplane may be certificated under the provisions of § 4a.737-T upon there having been established, in accordance with the terms of that section:

(1) A maximum take-off weight at sea level;

(2) A maximum landing weight at sea level;

(3) A maximum one-engine-inoperative operating altitude (as defined in § 4a.741-T), which shall be at least 5,000 feet at a weight equal to the maximum sea level take-off weight;

(4) Take-off characteristics at maximum sea level take-off weight, and landing characteristics at maximum sea level landing weight, in accordance with the provisions of §§ 4a.747-T and 4a.750-T, and

(5) Compliance with the requirements of all other applicable parts of the regulations of this part.

(b) If a certificate is issued under these conditions, it may be amended from time to time to include landing and take-off weights over an increased range of altitudes and other pertinent performance data, including additional landing and take-off characteristics obtained in accordance with the provisions of §§ 4a.747-T and 4a.750-T.

[Amdt. 04-8, 7 F. R. 985]

DEFINITIONS

§ 4a.739-T *Stalling speeds.* In §§ 4a.737-T through 4a.760-T:

(a) V_{s_0} denotes the true indicated stalling speed of the airplane in miles per hour with engines idling, throttles closed, propellers in low pitch, landing gear extended, flaps in the "landing position", as defined in § 4a.740-T, cowl flaps closed, center of gravity in the most unfavorable position within the allowable landing range, and the weight of the airplane equal to the weight in connection with which V_{s_0} is being used as a factor to determine a required performance.

(b) V_{s_1} denotes the true indicated stalling speed in miles per hour with engines idling, throttles closed, propellers in low pitch, and with the airplane in all other respects (flaps, landing gear, etc.) in the condition existing in the particular test in connection with which V_{s_1} is being used.

[Amdt. 04-8, 7 F. R. 985]

§ 4a.740-T *Flap positions.* The flap positions denoted respectively as the landing position, approach position, and take-off position are those provided for in § 4a.464-T, and may be made variable with weight and altitude in accordance with that section.

[Amdt. 04-8, 7 F. R. 985]

(g) *Feathering-completion point.* The point where feathering or stopping of the inoperative propeller is completed, if the applicant desires to include this step in the take-off determination. It shall be assumed that the decision to feather or stop is made not earlier than the instant of attaining point (f).

(1) In the event that it is desired to include propeller feathering or stopping in the take-off path, the final climb segment, beginning at point (g), shall be assumed to correspond to the rate of climb at speed V_2 with landing gear retracted and the propeller of the inoperative engine feathered or stopped.

§ 4a.750-T. *Landing determination.* The horizontal distance required to land and come to a complete stop from a point at a height of 50 feet above the landing surface shall be determined for such range of weights and altitudes as the applicant may desire. In making this determination:

(a) Immediately prior to reaching the 50-foot altitude, a steady gliding approach shall have been maintained, with a true indicated air speed of at least $1.3 V_{S_0}$.

(b) The nose of the airplane shall not be depressed, nor the power increased, after reaching the 50-foot altitude. At all times during and immediately prior to the landing, the flaps shall be in the landing position, except that after the airplane is on the landing surface and the true indicated air speed has been reduced to not more than $0.9 V_{S_0}$ the flap position may be changed.

(c) The operating pressures on the braking system shall not be in excess of those approved by the manufacturer of the brakes.

(d) The brakes shall not be used in such manner as to produce excessive wear of brakes or tires.

(e) The landing shall be made in such manner that there is no excessive vertical acceleration, no tendency to bounce, nose over, porpoise, ground loop, or water loop, and in such manner that its reproduction shall not require any exceptional degree of skill on the part of the pilot, or exceptionally favorable conditions. If this last condition (with respect to exceptional skill or favorable conditions) is not met, the distance to be determined shall be that considered to correspond to a piloting technique normally usable.

[Amdt. 04-8, 7 F. R. 986]

FLIGHT CHARACTERISTICS

§ 4a.751-T. *Flight characteristics.* There shall be no flight characteristic which makes the airplane unairworthy. The airplane shall also meet the following requirements under all critical loading conditions within the range of center of gravity, and, except as provided in § 4a.753 (d), at the maximum weight for which certification is sought.

[Amdt. 04-8, 7 F. R. 986, as amended by Amdt. 04-2, 8 F. R. 13999]

§ 4a.752-T. *Controllability and maneuverability.* The airplane shall be controllable and maneuverable during take-off, climb, level flight, glide, and landing, and it shall be possible to make a smooth

transition from one flight condition to another, without requiring an exceptional degree of skill, alertness, or strength on the part of the pilot, under all conditions of operation probable for the type, including those conditions normally encountered in the event of sudden failure of any engine. It shall be possible, with power off, with flaps either retracted or in the landing position, with the center of gravity in the most unfavorable location within the certificated range, and with the airplane trimmed for a speed of $1.4 V_{S_1}$, to change the flap position to the opposite extreme, to make a sudden application of take-off power on all engines, or to change the speed to any value between $1.10 V_{S_1}$ and $1.70 V_{S_1}$, without requiring a change in the trim control or the exertion of more control force than can readily be applied with one hand for a short period. It shall not be necessary to use exceptional piloting skill in order to prevent loss of altitude when flap retraction from any position is initiated during steady horizontal flight at $1.1 V_{S_1}$, with simultaneous application of not more than maximum-except-take-off power.

[Amdt. 04-8, 7 F. R. 986]

§ 4a.753-T. *Trim.* The means used for trimming the airplane shall be such that after being trimmed and without further pressure upon or movement of either the primary control or its corresponding trim control by the pilot or the automatic pilot, the airplane will maintain:

(a) Lateral and directional trim under all conditions of operation consistent with the intended use of the airplane, including operation at any speed from best rate-of-climb speed to high speed and operation in which there is greatest lateral variation in the distribution of the useful load;

(b) Longitudinal trim, under the following conditions:

(1) During climb at the best rate-of-climb speed with maximum-except-take-off power.

(2) During a glide with power off at a speed not in excess of $1.4 V_{S_1}$, and

(3) During level flight at any speed from 90 percent of high speed to the sum of V_{S_1} and 20 percent of the difference between high speed and V_{S_1} ;

(c) Rectilinear climbing flight with the critical engine inoperative, each other engine operating at maximum-except-take-off power and the best rate-of-climb speed under such conditions;

(d) Rectilinear flight with any two engines inoperative and each other engine operating at maximum-except-take-off power under the following conditions:

(1) With the weight of the airplane not more than that at which there is a speed range in level flight of not less than 10 miles per hour;

(2) With the speed of the airplane not more than the high speed obtained under the conditions specified in subparagraph (1) of this paragraph less 10 miles per hour.

[Amdt. 04-8, 7 F. R. 986]

§ 4a.754-T. *Stability.* The airplane shall be longitudinally, directionally, and laterally stable in accordance with the following provisions. Suitable stability and control "feel" may be required in other conditions normally encountered in service if flight tests show such stability to be necessary for safe operation.

[Amdt. 04-8, 7 F. R. 987]

§ 4a.755-T. *Static longitudinal stability.* In the flight conditions described in § 4a.756-T,

(a) At any speed which can be obtained without excessive control force and which is more than 10 miles per hour above or below the specified trim speed, but not greater than the appropriate maximum permissible speed or less than the minimum speed in steady unstalled flight, the characteristics of the elevator control forces and friction shall be such that:

(1) A pull is required to maintain speeds below the specified trim speed and a push to maintain speeds above the specified trim speed.

(2) The control will, when unrestrained by the pilot, move continuously toward its original trim position.

(b) Where a stable slope of the stick force versus speed curve is specified, any decrease in speed below trim speed shall require an increase in the steady pull on the elevator control and any increase in speed above trim speed shall require an increase in the steady push on the control. Such slope shall be between such limits that any substantial change in speed is clearly perceptible to the pilot through a resulting change in stick force, and that the stick force required to produce necessary changes in speed does not reach excessive values.

[Amdt. 04-8, 7 F. R. 987]

§ 4a.756-T. *Specific stability conditions—(a) Landing.* With flaps in the sea level landing position, the landing gear extended, maximum sea level landing weight, the airplane trimmed at $1.4 V_{S_1}$ and throttles closed, the stick force curve shall have a stable slope at all speeds between $1.1 V_{S_1}$ and $1.8 V_{S_1}$.

(b) *Approach.* With flaps in sea level approach position, landing gear retracted, maximum sea level landing weight, the airplane trimmed at $1.4 V_{S_1}$ and with power sufficient to maintain level flight at this speed, the stick force curve shall have a stable slope at all speeds between $1.1 V_{S_1}$ and $1.8 V_{S_1}$.

(c) *Climb.* With flaps retracted, landing gear retracted, maximum sea level take-off weight, 75 percent of maximum-except-take-off power, and with the airplane trimmed at $1.4 V_{S_1}$, the stick force curve shall have a stable slope at all speeds between $1.2 V_{S_1}$ and $1.6 V_{S_1}$.

(d) *Cruising.* With flaps retracted, maximum sea level take-off weight, 75 percent of maximum-except-take-off power, and with the airplane trimmed for level flight, the stick force curve shall have a stable slope at all speeds obtainable with reasonable stick forces between:

(1) $1.2 V_{S_1}$ and the maximum permissible speed, when the landing gear is retracted;

§ 4a.741-T *Maximum one-engine-inoperative operating altitude.* Maximum one-engine-inoperative operating altitude (to be determined in complying with § 4a.709) shall be the altitude in standard air at which the steady rate of climb in feet per minute is $0.02 V_{SO}^2$ with the critical engine inoperative, its propeller stopped, all other engines operating at the maximum-except-take-off power available at such altitude, the landing gear retracted, and the flaps in the most favorable position.

[Amdt. 04-8, 7 F. R. 985]

WEIGHTS

§ 4a.742-T *Weights.* The maximum take-off weight and maximum landing weight shall be established by the applicant and may be made variable with altitude. The maximum take-off weight for any altitude shall not exceed the maximum design weight used in the structural loading conditions for flight loads (§§ 4a.72-4a.99), and shall not exceed the design weight used in the structural loading conditions for ground or water loads (§§ 4a.147-4a.156 and §§ 4a.161-4a.177, respectively) by a ratio of more than 1.15. The maximum landing weight for any altitude shall not exceed the design weight used in the structural loading conditions for ground or water loads.

[Amdt. 04-8, 7 F. R. 985]

§ 4a.743-T *Fuel dumping provisions.* (a) If the maximum take-off weight for any altitude exceeds the maximum landing weight for the same altitude, adequate provision shall be made, in accordance with Subpart G, for the rapid and safe dumping during flight of a quantity of fuel sufficient to reduce the weight of the airplane from such maximum take-off weight to such maximum landing weight. Compliance with this section shall be shown by dumping suitable colored fluids and fuel in flight tests in the following conditions:

- (1) Level flight at a speed of $2.0 V_{S1}$.
- (2) Climb at a speed of $1.4 V_{S1}$ with 75 percent of maximum-except-take-off power.
- (3) Glide with power off at a speed of $1.4 V_{S1}$.

(b) In conditions (a) (1) and (2), the time required to dump the necessary amount of fuel shall not exceed 10 minutes. During such tests, the dumped fluid shall not come in contact with any portion of the aircraft or adversely affect its control, nor shall any fumes from such fluid enter any portion of the aircraft.

[Amdt. 04-8, 7 F. R. 985]

PERFORMANCE REQUIREMENTS AND DETERMINATIONS

§ 4a.744-T *Required performance and performance determinations.* Performance data shall be corrected to standard atmosphere and still air where such corrections are applicable. Performance data may be determined by calculation from basic flight tests if the results of such calculation are substantially equal in accuracy to the results of direct tests.

[Amdt. 04-8, 7 F. R. 985]

§ 4a.745-T *Stalling speed requirements.* (a) V_{SO} at maximum landing

weight shall not exceed 80 miles per hour.

(b) V_{S1} at maximum landing weight, flaps in the approach position, landing gear extended, and center of gravity in the most unfavorable position permitted for landing, shall not exceed 85 miles per hour.

[Amdt. 04-8, 7 F. R. 985]

§ 4a.746-T *Climb requirements.* In the climb tests required by this section, the engine cowl flaps, or other means of controlling the engine cooling air supply, shall be in a position which will provide adequate cooling with maximum-except-take-off power at best climbing speed under standard atmospheric conditions.

(a) *Flaps in landing position.* The steady rate of climb in feet per minute, at any altitude within the range for which landing weight is to be specified in the certificate, with the weight equal to maximum landing weight for that altitude, all engines operating at the take-off power available at such altitude, landing gear extended, center of gravity in the most unfavorable position permitted for landing, and flaps in the landing position, shall be at least $0.07 V_{SO}^2$.

(b) *Flaps in approach position.* The steady rate of climb in feet per minute, at any altitude within the range for which landing weight is to be specified in the certificate, with the weight equal to maximum landing weight for that altitude, the critical engine inoperative, its propeller stopped, all other engines operating at the take-off power available at such altitude, the landing gear retracted, center of gravity in the most unfavorable position permitted for landing, and the flaps in the approach position, shall be at least $0.04 V_{SO}^2$.

(c) *Flaps in take-off position.* The steady rate of climb in feet per minute, at any altitude within the range for which take-off weight is to be specified in the certificate, with the weight equal to maximum take-off weight for that altitude, the speed equal to the minimum take-off climb speed permitted in § 4a.748-T (b), the critical engine inoperative, its propeller windmilling with the propeller control in a position which would allow the engine (if operating normally and within approved limits) to develop at least 50 percent of maximum-except-take-off engine speed, all other engines operating at the take-off power available at such altitude, the landing gear retracted, center of gravity in the most unfavorable position permitted for take-off, and the flaps in the take-off position, shall be at least $0.035 V_{S1}^2$.

[Amdt. 04-8, 7 F. R. 985]

§ 4a.747-T *Take-off determination.* The take-off data set forth in §§ 4a.748-T and 4a.749-T shall be determined over such range of weights and altitudes as the applicant may desire, with a constant take-off flap position for a particular weight and altitude, and with the operating engines at not more than the take-off power available at the particular altitude. These data shall be based on a level take-off surface with zero wind.

[Amdt. 04-8, 7 F. R. 986]

§ 4a.748-T *Speeds—(a) Critical-engine-failure speed.* denoted by V_1 , is a true indicated air speed, chosen by the applicant, but in any case not less than the minimum speed at which the controllability is adequate to proceed safely with the take-off, using normal piloting skill, when the critical engine is suddenly made inoperative.

(b) *Minimum take-off climb speed.* denoted by V_2 , is a true indicated air speed chosen by the applicant, which shall permit the rate of climb required in § 4a.746-T (c) but which shall not be less than $1.20 V_{S1}$ for two-engined airplanes, or $1.15 V_{S1}$ for airplanes having more than two engines, or less than 1.10 times the minimum speed at which the airplane is fully controllable in flight using normal piloting skill when the critical engine is suddenly made inoperative.

[Amdt. 04-8, 7 F. R. 986]

§ 4a.749-T *Take-off path.* The lengths and slopes of segments of the take-off path, and the location of critical points on the complete path shall be determined in accordance with the following conditions and assumptions. The location of the points defined in paragraphs (a) to (e) of this section shall be expressed in terms of the horizontal and vertical distances from the starting point.

(a) *Starting point.* The point from which a standing start is made with all engines operating.

(b) *Critical-engine-failure point.* The point at which the airplane attains speed V_1 (critical-engine-failure speed) when accelerated from point (a) with all engines operating.

(c) *Accelerate-and-stop point.* The point on the take-off surface at which the airplane can be brought safely to a stop if all engines are cut at point (b).

(d) *Start-of-climb point.* The point on or just clear of the take-off surface at which the airplane attains speed V_2 (take-off climb speed) when the critical engine is made inoperative with its propeller windmilling in low pitch at point (b).

The take-off acceleration segment, (a) to (d), shall be determined by making a continuous run up to speed V_2 with the critical engine cut at point (b).

(e) *Retraction-completion point.* The point at which landing gear retraction is completed when retraction is initiated not earlier than point (d).

(1) The initial climb segment, (d) to (e), shall be assumed to correspond to the rate of climb at speed V_2 with landing gear extended and windmilling propeller in low pitch.

(2) The second climb segment, beginning at point (e), shall be assumed to correspond to the rate of climb at speed V_2 with landing gear retracted and windmilling propeller in high pitch, as defined in § 4a.746-T (c). This segment may continue indefinitely or may end at point (g) in accordance with paragraph (g) of this section.

(f) *50-foot height point.* The point at which the airplane attains a height of 50 feet (above the take-off surface) along the take-off flight path defined herein.

RULES AND REGULATIONS

(2) 1.2 V_{s1} and the level flight speed, when the landing gear is extended.

[Amdt. 04-8, 7 F. R. 987]

§ 4a.757-T *Dynamic longitudinal stability.* The airplane shall not be dynamically unstable longitudinally, as shown by the damping of the normal long period oscillation, under any flight condition that is likely to be maintained for more than 10 minutes in ordinary service. Compliance with this requirement shall be demonstrated under at least the following conditions:

(a) During level flight with 75 percent of maximum-except-take-off power.

(b) During a climb with 75 percent of maximum-except-take-off power at a speed equal to 75 percent of that obtained in paragraph (a) of this section.

Any short period oscillation occurring between stalling speed and maximum permissible speed shall be heavily damped with the primary controls in a fixed position.

[Amdt. 04-8, 7 F. R. 987]

§ 4a.758-T *Directional and lateral static stability.* The static directional stability, as shown by the tendency to recover from a skid with rudder free, shall be positive for all flap positions and symmetrical power conditions, and for all speeds from 1.2 V_{s1} up to the maximum permissible speed. The static lateral stability as shown by the tendency to raise the low wing in a sideslip, shall be positive within the same limits.

[Amdt. 04-8, 7 F. R. 987]

§ 4a.759-T *Stalling.* With power off, and with that power necessary to maintain level flight with flaps in approach position at a speed of 1.6 V_{s1} , maximum landing weight, flaps and landing gear in any position, and center of gravity in the least favorable position for recovery, it shall be possible to produce and to correct roll and yaw by unreversed use of the aileron and rudder controls up to the time when the airplane pitches in the maneuver described below. During the pitching and recovery portions of the maneuver it shall be possible to prevent appreciable rolling or yawing by normal use of the controls.

In demonstrating this quality, the order of events shall be:

(a) With trim controls adjusted for straight flight at a speed of 1.4 V_{s1} , reduce speed by means of the elevator control until the speed is steady at slightly above stalling speed; then

(b) Pull elevator control back at a normal rate until a stall is produced as evidenced by an uncontrollable downward pitching motion of the airplane, or until the control reaches the stop. Normal use of the elevator control for recovery may be made after such pitching motion is unmistakably developed.

In any case, the airplane shall not pitch excessively before recovery is completed.

The airplane shall be recoverable without difficulty or the use of power from the inoperative engine when it is stalled with the critical engine inoperative and the remaining engines operat-

ing at 75 percent of maximum-except-take-off power.

[Amdt. 04-8, 7 F. R. 987]

OPERATING MANUAL

§ 4a.760-T *Airplane operating manual.* There shall be furnished with each airplane a copy of a manual which shall contain such information regarding the operation of the airplane as the Administrator may require, including, but not limited to, the following:

(a) All performance data secured under §§ 4a.741-T through 4a.750-T together with any pertinent descriptions of the conditions, air speeds, etc., under which such data were determined.

(b) Adequate instructions for the use and adjustment of the flap controls under § 4a.464-T.

(c) The indicated air speeds corresponding to those determined in § 4a.748-T, together with pertinent discussion of procedures to be followed if the critical engine becomes inoperative on take-off.

(d) A discussion of any significant or unusual flying or ground-handling

characteristics, knowledge of which would be useful to a pilot not previously having flown the airplane.

[Amdt. 04-8, 7 F. R. 987]

§ 4a.760-T-1 *Airplane flight manuals* (CAA policies which apply to § 4a.760-T). See § 4b.911-1 of this subchapter.

[Supp. 2, 13 F. R. 4182. Correction noted at 14 F. R. 37]

SUBPART I—MISCELLANEOUS REQUIREMENTS

SOURCE: §§ 4a.771 and 4a.772 contained in Civil Air Regulations, May 31, 1938.

§ 4a.771 *Standard weights.* In computing weights the following standard values shall be used:

Gasoline..... 6 pounds per gallon.
Lubricating oil..... 7.5 pounds per gallon.
Crew and passengers.. 170 pounds per person, unless otherwise specified by the Administrator.
Parachutes..... 20 pounds each.

§ 4a.772 *Leveling means.* Adequate means shall be provided for easily determining when the aircraft is in a level position.

APPENDIX—TABLES AND FIGURES

TABLE 4a-1.—SYMMETRICAL FLIGHT CONDITIONS (FLAPS RETRACTED)

1. Condition	I	II	III	IV	V	VI
2. Reference	§ 4a.79 V_L	§ 4a.81 V_L	§ 4a.82 V_L	§ 4a.83 V_L	§ 4a.84 V_L	§ 4a.85 V_L
3. Design Speed (see § 4a.73)	V_L	V_L	V_L	V_L	V_L	V_L
4. Gust Velocity, U , f. p. s. (1) (2)	+30	+30	+15	+15	+15	+15
5. Δn (a) Gust (2)	§ 4a.76	§ 4a.76	§ 4a.76	§ 4a.76	-0.5 Δn_{IV}	-0.25 Δn_{IV}
6. Limit Load Factor, n . When item 5 gives two values of Δn , use larger	Fig. 4a-3	Fig. 4a-3	Fig. 4a-3	Fig. 4a-3	Fig. 4a-3	Fig. 4a-3
7. Minimum Value of n	1+ Δn_{II}	1+ Δn_{II}	1+ Δn_{II}	1+ Δn_{II}	1+ Δn_{II}	1+ Δn_{II}
8. Minimum Yield Factor of Safety, f_y	2.50	2.50	2.50	2.50	2.50	2.50
9. Minimum Ultimate Factor of Safety, f_u	1.0	1.0	1.0	1.0	1.0	1.0
10. Minimum Ultimate Factor of Safety, f_u	1.5	1.5	1.5	1.5	1.5	1.5

(1) Feet per second.

(2) + means upward, - means downward.

(3) May be limited by maximum dynamic lift coefficient obtainable under sudden changes of angle of attack.

[CAR, May 31, 1938, as amended by Amdt. 48, 5 F. R. 1837]

TABLE 4a-2.—SYMMETRICAL FLIGHT CONDITIONS (FLAPS EXTENDED)

1. Condition	VII	VIII	IX
2. Reference	§ 4a.87 V_L	§ 4a.88 V_L	§ 4a.89 V_L
3. Design Speed (see § 4a.73)	V_L	V_L	V_L
4. Gust Velocity, U , f. p. s. (1) (2)	+15	+15	+15
5. Δn (2)	§ 4a.76	§ 4a.76	§ 4a.76
6. Limit Load Factor, n	1+ Δn_{VII}	1+ Δn_{VIII}	1+ Δn_{IX}
7. Minimum Value of n	2.00	2.00	2.00
8. Minimum Yield Factor of Safety, f_y	1.0	1.0	1.0
9. Minimum Ultimate Factor of Safety, f_u	1.5	1.5	1.5

(1) Feet per second.

(2) + means upward, - means downward.

(3) May be limited by maximum dynamic lift coefficient obtainable under sudden changes of angle of attack.

[CAR, May 31, 1938, as amended by Amdt. 48, 5 F. R. 1837]

TABLE 4a-3.—LOADING CONDITIONS FOR HORIZONTAL TAIL SURFACES

1. Condition	Balancing	Maneuvering	Damping	Tab effects
2. Reference	§ 4a.116	§ 4a.117 V_L	§ 4a.118	§ 4a.119 V_L

7. Span Distribution				
8. Minimum Average Limit Pressure, p. s. f. (c)				
9. Special Requirements				
10. Minimum Yield Factor of Safety, f_s				
11. Minimum Ultimate Factor of Safety, f_u				

(1) Over entire vertical tail.
(2) C_N is the dynamic pressure corresponding to V_p (see § 4a.42).
(3) See § 4a.120 (a) for exception.
(4) See § 4a.123 (b) for exception.
(5) See § 4a.122 (c).
(6) Refers to main surface, disregarding tab; uniform pressure distribution may be assumed over tab.
(7) Refers to main surface, disregarding tab; uniform pressure distribution may be assumed over tab.

[CAR, May 31, 1938, as amended by Amdt. 5, 4 F. R. 1170]

TABLE 4a-5.—LOADING CONDITIONS FORAILERONS

1. Condition	Maneuvering	Tab effects
2. Reference	§ 4a.125 V_p (c) $C_N=0.45$	§ 4a.126 V_L (c)
3. Design Speed (see § 4a.75)		
4. C_N or Gust		
5. Average Limit Pressure, p. s. f.		
6. Chord Distribution		
7. Span Distribution		
8. Minimum Average Limit Pressure, p. s. f.		
9. Special Requirements		
10. Minimum Yield Factor of Safety, f_s		
11. Minimum Ultimate Factor of Safety, f_u		

(1) See § 4a.125 (a) for exception.
(2) C_N is the dynamic pressure corresponding to V_p (see § 4a.42).
(3) V_L is the maximum level flight air speed with any engine inoperative.
(4) Refers to main surface, disregarding tab; uniform pressure distribution may be assumed over tab.

[CAR, May 31, 1938]

TABLE 4a-6.—LOADING CONDITIONS FOR CONTROL SYSTEMS
(See § 4a.137)

	Elevator	Rudder	Flaps, tabs, etc.
	Symmetrical thrust (c)	Unsymmetrical thrust (c)	
1. Reference	139	140	141
2. Maximum Limit Control Force, pounds	200	200	80
3. Minimum Limit Control Force, pounds	130	130	Fig. 4a-9
4. Minimum Yield Factor of Safety, f_s	1.0	1.0	1.0
5. Minimum Ultimate Factor of Safety, f_u	1.5	1.5	1.5

(1) Propeller axes all in plane of symmetry.
(2) Propeller axes not all in plane of symmetry.

TABLE 4a-7.—ADDITIONAL (MULTIPLYING) FACTORS OF SAFETY
(See § 4a.207-4a.216)

Item	Component	Reference	Additional yield factor of safety, f_y	Additional ultimate factor of safety, f_u	May be covered by Item No.
1. Fittings (except control system fittings)		4a.208	None	1.20	2, 4, 5, 6, 7, 8, 9
2. Cables		4a.209	None	2.00	7, 8
3. Parallel double wires in wing lift truss		4a.210	None	1.05	4
4. Wires at small angles		4a.211	None	See Ref.	
5. Double drag truss wires		4a.212	None	See Ref.	
6. Torque tubes used as hinges		4a.213	None	1.5	
7. Control surface hinges (c)		4a.214	None	6.67	
8. Control system joints (c)		4a.215	None	3.33	
9. Wire sizes		4a.216	None	See Ref.	
10. Wing lift truss (landing conditions only)			None	1.10	

(c) For bearing stresses only.

PART 4b—AIRPLANE AIRWORTHINESS;
TRANSPORT CATEGORIES

SUBPART A—AIRWORTHINESS REQUIREMENTS

GENERAL

- Sec.
4b.1 Scope.
4b.2 Date of effectiveness.
4b.6 Airplane categories.

AIRWORTHINESS CERTIFICATES

- Sec.
4b.11 Classification.
4b.12 Eligibility.

TYPE CERTIFICATES

- 4b.15 Requirements for issuance.
4b.16 Data required for NC (standard) and NR (restricted) certification.

- Sec.
4b.17 Inspection and tests for NC (standard) and NR (restricted) certification.
4b.18 Inspection.
4b.19 Flight tests.

CHANGES

- 4b.26 Continued compliance.
4b.27 Minor changes.
4b.28 Major changes.
4b.29 Service experience changes.
4b.30 Current compliance.

APPROVAL OF MATERIALS, PARTS, PROCESSES, AND APPLIANCES

- 4b.41 Specifications.

DEFINITIONS

- 4b.51 Standard atmosphere.
4b.52 Hot-day condition.
4b.53 Airplane configuration.
4b.54 Weights.
4b.55 Power.
4b.56 Speeds.
4b.57 Structural terms.
4b.58 Susceptibility of materials to fire.
4b.58-1 Fire-resistant aircraft material (CAA rules which apply to § 4b.58).

SUBPART B—FLIGHT REQUIREMENTS

GENERAL

- 4b.71 Policy re proof of compliance.
4b.72 Flight test pilot.
4b.73 Noncompliance with test requirements.
4b.74 Emergency egress.
4b.75 Report.

WEIGHT RANGE AND CENTER OF GRAVITY

- 4b.81 Weight and balance.
4b.82 Use of ballast.
4b.83 Empty weight.
4b.84 Maximum weight.
4b.85 Minimum weight.
4b.86 Center of gravity position.

PERFORMANCE REQUIREMENTS

GENERAL

- 4b.91 Performance.
4b.92 Minimum requirements for certification.
4b.93 Definition of stalling speeds.

TAKE-OFF

- 4b.94 Take-off data.
4b.95 Speeds.
4b.96 Accelerate-stop distance.
4b.96-1 Reverse thrust used in establishing accelerate-stop distance (CAA policies which apply to § 4b.96).
4b.97 Take-off path.

CLIMB

- 4b.101 Requirements.
4b.102 All engines operating.
4b.103 One engine inoperative.
4b.104 Two engines inoperative.

LANDING

- 4b.111 Distance.
4b.112 Landplanes.
4b.112-1 Landing distances (CAA policies which apply to § 4b.112 (c)).
4b.113 Seaplanes or float planes.
4b.114 Ski-planes.

FLIGHT CHARACTERISTICS

- 4b.121 Requirements.

CONTROLLABILITY

- 4b.126 General.
4b.127 Longitudinal control.
4b.128 Lateral and directional control.
4b.129 Minimum control speed.

TRIM

- 4b.136 Requirements.

STABILITY

- 4b.141 General.
4b.142 Static longitudinal stability.

- Sec.
4b.143 Specific conditions.
4b.144 Dynamic longitudinal stability.
4b.145 Directional and lateral stability.
- STALLS**
4b.151 Stalling demonstration.
4b.152 Stall test; one engine inoperative.
- GROUND AND WATER CHARACTERISTICS**
4b.161 Requirements.
4b.162 Longitudinal stability and control.
4b.163 Directional stability and control.
4b.164 Shock absorption.
4b.165 Spray characteristics.
4b.166 Critical cross wind.
- FLUTTER AND VIBRATION**
4b.171 Flutter and vibration.
- SUBPART C—STRENGTH REQUIREMENTS**
GENERAL
4b.176 Loads.
4b.177 Factor of safety.
4b.178 Strength and deformations.
4b.179 Proof of structure.
- FLIGHT LOADS**
4b.186 General.
4b.187 Definition of flight load factor.
- SYMMETRICAL FLIGHT CONDITIONS (FLAPS RETRACTED)**
4b.188 General.
4b.189 Design air speeds.
4b.190 Maneuvering envelope.
4b.191 Gust envelope.
4b.192 Gust load factors.
- HIGH LIFT DEVICES EXTENDED CONDITIONS**
4b.193 High lift devices extended.
- INVESTIGATION OF SPECIFIC CONDITIONS**
4b.196 General.
4b.197 Maneuvering conditions.
4b.198 Gust conditions.
- UNSYMMETRICAL FLIGHT CONDITIONS**
4b.200 Unsymmetrical flight conditions.
4b.201 Rolling conditions.
4b.202 Yawing conditions.
- SUPPLEMENTARY FLIGHT CONDITIONS**
4b.206 Engine torque effects.
4b.207 Side load on engine mount.
4b.208 Pressure cabin loads.
- CONTROL SURFACE LOADS**
4b.216 General.
4b.217 Pilot effort.
4b.218 Trim tab effects.
4b.219 Unsymmetrical loads.
4b.220 Outboard fins.
4b.221 Wing flaps.
4b.222 Tabs.
4b.223 Special devices.
- CONTROL SYSTEM LOADS**
4b.231 Primary flight controls and systems.
4b.232 Dual controls.
4b.233 Ground gust conditions.
4b.234 Secondary controls and systems.
- GROUND LOADS**
4b.241 Limit loads.
4b.242 Design weights.
4b.243 Load factor for landing conditions.
4b.244 Landing cases and attitudes.
4b.245 Level landing.
4b.246 Tail-down landing.
4b.247 One-wheel landing.
4b.248 Lateral drift landing.
- TAXIING CONDITIONS**
4b.251 General.
4b.252 Take-off run.
4b.253 Braked roll.
4b.254 Ground maneuvering.
4b.255 Unsymmetrical loads on dual wheel units.

- WATER LOADS**
Sec.
4b.261 General.
4b.262 Design weight.
- BOAT SEAPLANES**
4b.266 Local bottom pressures.
4b.267 Distributed bottom pressures.
4b.268 Step loading condition.
4b.269 Bow loading condition.
4b.270 Stern loading condition.
4b.271 Side loading condition.
- FLOAT SEAPLANES**
4b.276 Landing with inclined reactions.
4b.277 Landing with vertical reactions (float seaplanes).
4b.278 Landing with side load (float seaplanes).
4b.279 Seaplane float loads.
4b.280 Seaplane float bottom loads.
- WING-TIP FLOAT AND SEA WING LOADS**
4b.286 Wing-tip float loads.
4b.287 Primary wing structure.
4b.288 Sea wing loads.
- EMERGENCY LANDING CONDITIONS**
4b.291 General.
4b.292 Ditching provisions.
- SUBPART D—DESIGN AND CONSTRUCTION**
GENERAL
4b.301 Minimum tests.
4b.302 Materials.
4b.302-1 Technical Standard Order TSO-C14: "Aircraft Fabric, Intermediate Grade, External Covering Material" (CAA rules which apply to § 4b.302).
4b.302-2 Technical Standard Order TSO-C15: "Aircraft Fabric, Grade 'A,' External Covering Material" (CAA rules which apply to § 4b.302).
4b.303 Fabrication methods.
4b.304 Standard fastenings.
4b.305 Protection.
4b.306 Inspection provisions.
- STRUCTURAL PARTS**
4b.311 Material strength properties and design values.
4b.312 Special factors.
4b.313 Variability factor.
4b.314 Bearing factors.
4b.315 Fitting factor.
4b.316 Fatigue strength.
- FLUTTER, VIBRATION, AND STIFFNESS**
4b.321 Flutter and vibration prevention measures.
4b.322 Stiffness.
- WINGS**
4b.331 External bracing.
4b.332 Covering.
4b.332-1 Aircraft fabric (CAA rules which apply to § 4b.332).
- CONTROL SURFACES (FIXED AND MOVABLE)**
4b.341 Proof of strength.
4b.342 Installation.
4b.343 Hinges.
- CONTROL SYSTEMS**
4b.351 General.
4b.352 Primary flight controls.
4b.353 Trimming controls.
4b.354 Wing flap controls.
4b.355 Flap interconnection.
4b.356 Stops.
4b.357 Control system locks.
4b.358 Proof of strength.
4b.359 Operation test.
- CONTROL SYSTEM DETAILS**
4b.366 General.
4b.367 Cable systems.
4b.368 Joints.

- LANDING GEAR**
SHOCK ABSORBERS
Sec.
4b.371 Tests.
4b.372 Shock absorption tests.
4b.373 Limit drop tests.
4b.374 Limit load factor determination.
4b.375 Reserve energy absorption drop tests.
- RETRACTING MECHANISM**
4b.381 General.
4b.382 Emergency operation.
4b.383 Operation test.
4b.384 Position indicator and warning device.
4b.385 Control.
- WHEELS AND TIRES**
4b.391 Wheels.
4b.392 Tires.
- BRAKES**
4b.396 General.
4b.396-1 Reverse thrust as substitute for dual brake system (CAA policies which apply to § 4b.396).
4b.397 Parking brake.
4b.398 Brake controls.
- SKIS**
4b.406 Requirements.
4b.407 Installation.
4b.408 Tests.
- HULLS AND FLOATS**
4b.416 Buoyancy (main seaplane floats).
4b.417 Buoyancy (boat seaplanes).
- FUSELAGE**
PILOT COMPARTMENT
4b.421 General.
4b.422 Vision.
4b.423 Cockpit arrangement.
4b.424 Instruments and markings.
4b.425 Noise and vibration.
- EMERGENCY PROVISIONS**
4b.431 Flotation.
4b.432 Emergency exits.
4b.433 Number of exits.
4b.434 Exit arrangement.
- PASSENGER AND CREW ACCOMMODATIONS**
4b.441 External doors.
4b.442 Internal doors.
4b.443 Seats, berths, and safety belts.
4b.444 Ventilation and heating.
4b.445-1 Technical Standard Order TSO-C20: "Combustion Heaters" (CAA rules which apply to § 4b.445).
4b.447 Cabin interiors.
4b.447-1 Fire-resistant aircraft material (CAA rules which apply to § 4b.447).
4b.448 Cargo and baggage compartments.
4b.448-1 Technical Standard Order TSO-C1a: "Smoke Detectors" (CAA rules which apply to § 4b.448 (b)).
4b.448-2 Technical Standard Order TSO-C11: "Fire Detectors" (CAA rules which apply to § 4b.448 (b)).
4b.448-3 Technical Standard Order TSO-C17: "Fire Resistant Aircraft Material" (CAA rules which apply to § 4b.448 (b)).
4b.448-4 Technical Standard Order TSO-C19: "Portable Water-Solution Type Fire Extinguishers" (CAA rules which apply to § 4b.448 (b) (2) (i) and (ii)).
4b.451 Pressure cabins.
4b.456 Reinforcement near propellers.
- MISCELLANEOUS**
4b.461 Leveling marks.

SUBPART E—POWER-PLANT INSTALLATION]
RECIPROCATING ENGINES

- Sec.
4b.466 Components.
4b.466-1 Reverse-thrust propeller (CAA poli-
cies which apply to § 4b.466).

ENGINES AND PROPELLERS

- ENGINES
4b.471 Engines.
4b.472 Engine isolation.
4b.473 Control of engine rotation.

- PROPELLERS
4b.474 Type.
4b.475 Propeller vibration.
4b.476 Propeller pitch and speed limitations.
4b.477 Propeller clearance.
4b.478 Propeller de-icing provisions.

FUEL SYSTEM

- 4b.481 General.
ARRANGEMENT
4b.482 Fuel system arrangement.
4b.483 Fuel system independence.
4b.484 Pressure cross-feed arrangements.

OPERATION

- 4b.491 Fuel flow rate.
4b.492 Fuel flow rate for pump systems.
4b.493 Fuel flow rate for transfer systems.
4b.494 Determination of unusable fuel sup-
ply and fuel system operation on
low fuel.
4b.495 Fuel system hot weather operation.
4b.496 Flow between interconnected tanks.

FUEL TANKS

- 4b.501 General.
4b.502 Fuel tank tests.
4b.503 Fuel tank installation.
4b.504 Fuel tank expansion space.
4b.505 Fuel tank sump.
4b.506 Fuel tank filler connection.
4b.507 Fuel tank vents and carburetor vapor
vents.
4b.508 Fuel tank outlet.

FUEL PUMPS

- 4b.511 Fuel pump and pump installation.

LINES AND FITTINGS

- 4b.516 Fuel system lines and fittings.
4b.517 Lines and fittings in designated fire
zones.
4b.518 Fuel valves.
4b.519 Fuel strainer.

DRAINS AND INSTRUMENTS

- 4b.526 Fuel system drains.
4b.531 Fuel system instruments.

FUEL JETTISONING SYSTEM

- 4b.536 Fuel jettisoning system.

OIL SYSTEM

- 4b.541 General.
4b.542 Oil cooling.

OIL TANKS

- 4b.546 General.
4b.547 Oil tank tests.
4b.548 Oil tank installation.
4b.549 Oil tank expansion space.
4b.550 Oil tank filler connection.
4b.551 Oil tank vent.

4b.932 Airworthiness certificate number.

AUTHORITY: §§ 4b.1 to 4b.932 issued under sec. 205 (a), 52 Stat. 984; 49 U. S. C. 425 (a). Interpret or apply secs. 601, 603, 52 Stat. 1007, 1009; 49 U. S. C. 551, 553.

SOURCE: §§ 4b.1 to 4b.932 contained in Amendment 04-0, Civil Air Regulations, 11 F. R. 71, except as noted following provisions affected.

SUBPART A—AIRWORTHINESS REQUIREMENTS

GENERAL

§ 4b.1 Scope. An airplane shall be shown to comply with the airworthiness requirements set forth in this part and shall have no characteristic which, according to the findings of the Administrator, makes the airplane unairworthy in order to become eligible for type and airworthiness certificates: *Provided, That:*

(a) If any of the requirements of this part become inapplicable to a particular airplane because of increased knowledge of aeronautics or of the development of unforeseen design features, the Administrator shall accept designs shown to provide an equivalent standard of safety.

(b) Other requirements with respect to airworthiness found by the Administrator to provide an equivalent standard of safety shall be accepted in lieu of the requirements set forth in this part.

§ 4b.2 Date of effectiveness. (a) Aircraft certificated as a type on or after November 9, 1945, shall comply either with (1) the entire provisions of Part 4a of this chapter in effect immediately prior to that date, or (2) the entire provisions prescribed in this part except that aircraft certificated under subparagraph (1) of this paragraph may incorporate provisions of subparagraph (2) of this paragraph when the Administrator finds the standard of safety to be equivalent to the particular and all related items of the latter.

(b) Aircraft certificated as a type on or after January 1, 1948, shall comply with the provisions of this part. If the prototype is not flown prior to January 1, 1948, and satisfactory evidence is presented indicating that the design work of the type was well advanced prior to November 9, 1945, and the delay of completion of the airplane was due to causes beyond the manufacturer's control, the Administrator may certificate the airplane as a type under the provisions of Part 4a which were in effect prior to November 9, 1945.

(c) Unless otherwise specified, an amendment to this part will apply only to airplanes for which application for a type certificate has been received subsequent to the effective date of such amendment.

(d) All aircraft certificated under the transport category, the manufacture of

which is completed after September 30, 1947, shall comply with the following sections of this part: §§ 4b.58, 4b.442, 4b.445 (a), 4b.447, 4b.448 (b), 4b.448 (c), 4b.478, 4b.484, 4b.503 (c), 4b.516 through 4b.518, 4b.556, 4b.557, 4b.560, 4b.561, 4b.586-4b.595, 4b.621-4b.624, 4b.651-4b.655, 4b.661, and 4b.662-4b.676.

[Amdt. 04-0, 11 F. R. 71 as amended by Amdt. 04-1, 11 F. R. 11351, Amdt. 04b-7, 12 F. R. 5960]

§ 4b.6 *Airplane categories.* In this part airplanes are divided upon the basis of their intended operation into the following categories for the purposes of certification:

(a) *Transport.* Airplanes in this category must be multiengine, are limited to non-acrobatic operation, and intended for, but not limited to, scheduled passenger, cargo, or combined passenger and cargo carrying operation.

(b) *Restricted.* Airplanes in this category are intended to be operated for restricted purposes not logically encompassed by the transport category. The requirements of this category shall consist of all the provisions for the transport category which are not rendered inapplicable by the nature of the special purpose involved, plus suitable operating restrictions which the Administrator finds will provide a level of safety equivalent to that contemplated for the transport category.

AIRWORTHINESS CERTIFICATES

§ 4b.11 *Classification.* Airworthiness certificates are classified as follows:

(a) *NC (standard) certificates.* In order to become eligible for an NC (standard) certificate, the airplane must be shown to comply with all of the requirements contained in this part for at least one category, but not the restricted-purpose category.

(b) *NR (restricted) certificates.* In order to become eligible for an NR (restricted) certificate, an airplane must be shown to comply with all of the requirements of the restricted purpose category.

(c) *NX (experimental) certificates.* An airplane will become eligible for an NX (experimental) certificate when the applicant presents satisfactory evidence that the airplane is to be flown for experimental purposes and the Administrator finds it may, with appropriate restrictions, be operated for that purpose in a manner which does not endanger the general public. The applicant shall submit sufficient data such as photographs to identify the airplane satisfactorily and, upon inspection of the airplane, any pertinent information found necessary by the Administrator to safeguard the general public.

§ 4b.12 *Eligibility.* An airplane manufactured in accordance with a type certificate (see §§ 4b.15-4b.19) and conforming with the type design will become eligible for an airworthiness certificate when, upon inspection of the airplane, the Administrator determines it so to conform and that the airplane is in a condition for safe operation. For each newly manufactured airplane this deter-

mination shall include a flight check by the applicant.

[Amdt. 04-0, 11 F. R. 71, as amended by Amdt. 04b-10, 13 F. R. 2966]

TYPE CERTIFICATES

§ 4b.15 *Requirements for issuance.* A type certificate will be issued when the requirements of §§ 4b.16-4b.19 are met.

§ 4b.16 *Data required for NC (standard) and NR (restricted) certification.* The applicant for a type certificate shall submit to the Administrator the following:

(a) Such descriptive data, test reports, and computations as are necessary to demonstrate that the airplane complies with the airworthiness requirements. The descriptive data shall be known as the type design and shall consist of drawings and specifications disclosing the configuration of the airplane and all design features covered in the airworthiness requirements as well as sufficient information on dimensions, materials, and processes to define the strength of the structure. The type design shall describe the airplane in sufficient detail to permit the airworthiness of subsequent airplanes of the same type to be determined by comparison with the type design.

[Amdt. 04-0, 11 F. R. 71, as amended by Amdt. 04b-10, 13 F. R. 2966]

§ 4b.17 *Inspection and tests for NC (standard) and NR (restricted) certification.* The authorized representatives of the Administrator shall have access to the airplane and may witness or conduct such inspections and tests as are necessary to insure compliance with the airworthiness requirements.

[Amdt. 04-0, 11 F. R. 71, as amended by Amdt. 04b-10, 13 F. R. 2966]

§ 4b.18 *Inspection.* Inspections and tests shall include all those found necessary by the Administrator to insure that the airplane conforms with the following:

(a) All materials and products are in accordance with the specifications given in the type design.

(b) All parts of the airplane are constructed in accordance with the drawings contained in the type design.

(c) All manufacturing processes, construction, and assembly are such that the design strength and safety contemplated by the type design will be realized in service.

§ 4b.19 *Flight tests.* (Applicable to all airplanes certificated as a type on or after May 15, 1947.) After proof of compliance with the structural requirements contained in this part, and upon completion of all necessary inspection and testing on the ground, and proof of the conformity of the airplane with the type design, and upon receipt from the applicant of a report of flight tests conducted by him, there shall be conducted such official flight tests as the Administrator finds necessary to determine compliance with Subparts B-G. After the conclusion of these flight tests such additional flight tests shall be conducted as the Administrator finds necessary to ascertain whether there is reasonable assurance that the air-

plane, its components, and equipment are reliable and function properly. The extent of such additional flight tests shall depend upon the complexity of the airplane, the number and nature of new design features, and the record of previous tests and experience for the particular airplane model, its components, and equipment. If practicable, the flight tests performed for the purpose of ascertaining the reliability and proper functioning shall be conducted on the same airplane which was used in flight tests to show compliance with Subparts B-G.

[Amdt. 04b-3, 12 F. R. 1029, as amended by Amdt. 04b-4, 12 F. R. 2087]

CHANGES

§ 4b.26 *Continued compliance.* Changes shall be substantiated to demonstrate continued compliance of the airplane with the appropriate airworthiness requirements in effect when the particular airplane was certificated as a type unless the applicant chooses to show compliance with the currently effective requirements subject to the approval of the Administrator or unless the Administrator finds it necessary to comply with current airworthiness requirements.

§ 4b.27 *Minor changes.* Minor changes to certificated airplanes which obviously do not impair the condition of the airplane for safe operation shall be approved by the authorized representatives of the Administrator prior to the submittal to the Administrator of any required revised drawings.

§ 4b.28 *Major changes.* A major change is any change not covered by minor changes as defined in § 4b.27.

§ 4b.29 *Service experience changes.* When the Administrator finds that service experience indicates the need for design changes, the applicant shall submit for the approval of the Administrator engineering data describing and substantiating the necessary changes. Upon approval by the Administrator, these changes shall be considered as a part of the type design, and descriptive data covering these changes shall be furnished by the applicant to all aircraft owners concerned.

§ 4b.30 *Current compliance.* In the case of airplanes approved as a type under the terms of earlier airworthiness requirements, the Administrator may require that an airplane submitted for an original airworthiness certificate comply with such portions of the currently effective airworthiness requirements as may be necessary for safety.

APPROVAL OF MATERIALS, PARTS, PROCESSES, AND APPLIANCES

§ 4b.41 *Specifications.* (a) Materials, parts, processes, and appliances shall be approved upon a basis and in a manner found necessary by the Administrator to implement the pertinent provisions of the Civil Air Regulations. The Administrator may adopt and publish such specifications as he finds necessary to administer this section, and shall incorporate therein such portions of the aviation industry, Federal, and military

specifications respecting such materials, parts, processes, and appliances as he finds appropriate.

(b) Any material, part, process, or appliance shall be deemed to have met the requirements for approval when it meets the pertinent specifications adopted by the Administrator, and the manufacturer so certifies in a manner prescribed by the Administrator.

[Amdt. 04b-8, 12 F. R. 7898]

DEFINITIONS

§ 4b.51 *Standard atmosphere.* The standard atmosphere shall be based upon the following assumptions:

- (a) The air is a dry perfect gas.
- (b) The temperature at sea level is 59° F.
- (c) The pressure at sea level is 29.92 inches Hg.
- (d) The temperature gradient from sea level to the altitude at which the temperature becomes -67° F. is -0.003566° F. per foot, and zero thereafter.
- (e) The density, ρ_0 , at sea level under the above conditions is 0.002378 lbs. sec.²/ft.³.

§ 4b.52 *Hot-day condition.* (See § 4b.577.)

§ 4b.53 *Airplane configuration.* This term refers to the position of the various elements affecting the aerodynamic characteristics of the airplane, such as landing gear, flaps, etc.

§ 4b.54 *Weights.*

	Reference sections
Empty weight: The actual weight used as a basis for determining operating weights.....	4b. 83
Maximum weight: The maximum weight at which the airplane may operate in accordance with the airworthiness requirements.....	4b. 84
Minimum weight: The minimum weight at which compliance with the airworthiness requirements is demonstrated.....	4b. 85
Design take-off weight: The maximum weight used in the structural design of the airplane for flight conditions, special landing conditions with reduced descent velocity (§ 4b.243 (a) (2)), and taxiing conditions.....	4b. 186
Design landing weight: The maximum weight used in the structural design of the airplane for normal landing conditions.....	4b. 242
Minimum design weight: The minimum weight condition investigated in the structural flight load conditions not greater than the minimum weight specified in § 4b.85. Minimum weight.....	4b. 186
Unit weights for design purposes:	
Gasoline.....	6 pounds per United States gallon.
Lubricating oil.....	7.5 pounds per United States gallon.
Crew and passengers.....	170 pounds per person.

§ 4b.55 *Power.*—(a) *One horsepower.* 33,000 foot-pounds per minute.

(b) *Take-off power.* The take-off rating of the engine established in accordance with Part 13, Aircraft Engine Airworthiness, of this chapter.

(c) *Maximum continuous power.* The maximum continuous rating of the engine established in accordance with Part 13, Aircraft Engine Airworthiness, of this chapter.

§ 4b.56 *Speeds.*

V_t True air speed of the airplane relative to the undisturbed air.

In the following symbols having subscripts, V denotes

- (a) "Equivalent" air speed for structural design purposes equal to $V_t \sqrt{\rho/\rho_0} = V_t \sqrt{\sigma}$
- (b) "True indicated" or "calibrated" air speed for performance and operating purposes equal to indicator reading corrected for position and instrument errors.

Reference sections

V_{s_0} stalling speed, in the landing configuration.....	4b. 93
V_{s_1} stalling speed in the configuration specified for particular conditions.....	4b. 93
V_{mc} minimum control speed.....	4b. 129
V_f design speed for flight load conditions with flaps in the landing position.....	4b. 189
V_p design maneuvering speed.....	4b. 189
V_b design speed for 40 feet per second gust.....	4b. 189
V_c design cruising speed.....	4b. 189
V_d design dive speed.....	4b. 189
V_{ne} never exceed speed.....	4b. 850
Maximum structural cruising speed.....	4b. 851

§ 4b.57 *Structural terms.*

Structure: Those portions of the airplane the failure of which would seriously endanger the safety of the airplane.

Design wing area, S : The area enclosed by the wing outline (including allons, and flaps in the retracted position, but ignoring fillets and fairings) on a surface containing the wing chords. The outline is assumed to extend through the nacelles and fuselage to the plane of symmetry.

Aerodynamic coefficients, C_L , C_N , C_M , etc., used in this part, are nondimensional coefficients for the forces and moments acting on an airfoil, and correspond to those adopted by the U. S. National Advisory Committee for Aeronautics.

- C_L = airfoil lift coefficient.
- C_N = airfoil normal force coefficient (normal to wing chord line).
- C_{NA} = airplane normal force coefficient (based on lift of complete airplane and design wing area).
- C_M = pitching moment coefficient.

Loads

	Reference sections
Limit load: The maximum load anticipated in service.....	4b. 176
Ultimate load: The maximum load which a part or structure must be capable of supporting.....	4b. 178
Factor of safety: The factor by which the limit load must be multiplied to establish the ultimate load.....	4b. 177
Load factor or acceleration factor, n : The ratio of the force acting on a mass to the weight of the mass. When the force in question represents the net external load acting on the airplane in a given direction, n represents the acceleration in that direction in terms of the gravitational constant.	
Limit load factor: The load factor corresponding to limit load.	
Ultimate load factor: The load factor corresponding to ultimate load.	

§ 4b.58 *Susceptibility of materials to fire.* Where necessary for the purpose of determining compliance with any of the definitions in this section, the Administrator shall prescribe the heat conditions and testing procedures which any

specific material or individual part must meet.

(a) *Fireproof.* "Fireproof" material means a material which will withstand heat equally well or better than steel in dimensions appropriate for the purpose for which it is to be used. When applied to material and parts used to confine fires in designated fire zones "fireproof" means that the material or part will perform this function under the most severe conditions of fire and duration likely to occur in such zones.

(b) *Fire-resistant.* When applied to sheet or structural members, "fire-resistant" material shall mean a material which will withstand heat equally well or better than aluminum alloy in dimensions appropriate for the purpose for which it is to be used. When applied to fluid-carrying lines, this term refers to a line and fitting assembly which will perform its intended protective functions under the heat and other conditions likely to occur at the particular location.

(c) *Flame-resistant.* "Flame-resistant" material means material which will not support combustion to the point of propagating, beyond safe limits, a flame after removal of the ignition source.

(d) *Flash-resistant.* "Flash-resistant" material means material which will not burn violently when ignited.

(e) *Inflammable.* "Inflammable" fluids or gases means those which will ignite readily or explode.

[Amdt. 04-1, 11 F. R. 11351]

§ 4b.58-1 *Fire-resistant aircraft material (CAA rules which apply to § 4b.58).* See § 4b.448-3.

[13 F. R. 7726]

SUBPART B—FLIGHT REQUIREMENTS

GENERAL

§ 4b.71 *Policy re proof of compliance.* Compliance with the requirements specified in this subpart governing functional characteristics shall be demonstrated by suitable flight or other tests conducted upon an airplane of the type, or by calculations based upon the test data referred to above: *Provided*, That the results so obtained are substantially equal in accuracy to the results of direct testing. Compliance with each requirement must be provided at the critical combination of airplane weight and center of gravity position, within the range of either, for which certification is desired for each practicably separable operating condition to which the requirement is applicable. Such compliance must be demonstrated by systematic investigation of all probable weight and center of gravity combinations or must be reasonably inferable from such as are investigated.

§ 4b.72 *Flight test pilot.* The applicant shall provide a person holding an appropriate pilot certificate to make the flight tests, but a designated representative of the Administrator may pilot the airplane insofar as that may be necessary for the determination of compliance with the airworthiness requirements.

§ 4b.73 *Noncompliance with test requirements.* Official type tests will be discontinued until corrective measures

have been taken by the applicant when either:

(a) The applicant's test pilot is unable or unwilling to conduct any of the required flight tests; or,

(b) Items of noncompliance with requirements are found which may render additional test data meaningless or are of such nature as to make further testing unduly hazardous.

§ 4b.74 *Emergency egress.* Adequate provisions shall be made for emergency egress and use of parachutes by members of the crew during the flight tests.

§ 4b.75 *Report.* The applicant shall submit to the representative of the Administrator a report covering all computations and tests required in connection with calibration of instruments used for test purposes and correction of test results to standard atmospheric conditions. The representative of the Administrator will conduct any flight tests which appear to him to be necessary in order to check the calibration and correction report.

WEIGHT RANGE AND CENTER OF GRAVITY

§ 4b.81 *Weight and balance.* There shall be established, as a part of the type inspection, ranges of weight and center of gravity within which the airplane may be safely operated.

§ 4b.82 *Use of ballast.* Removable ballast may be used to enable airplanes to comply with the flight requirements in accordance with the following provisions:

(a) The place or places for carrying ballast shall be properly designed, installed, and plainly marked as specified in § 4b.901.

(b) The airplane operating manual shall include instructions regarding the proper disposition of the removable ballast under all loading conditions for which such ballast is necessary, as specified in § 4b.916 (c).

§ 4b.83 *Empty weight.* The empty weight and corresponding center of gravity location shall include all fixed ballast, the unusable fuel supply (see § 4b.494), undrainable oil, full engine coolant, and hydraulic fluid. The weight and location of items of equipment installed in the airplane when weighed shall be noted in the operating manual.

§ 4b.84 *Maximum weight.* (a) The maximum landing and take-off weights shall not exceed any of the following:

(1) The weights selected by the applicant,

(2) The design weights for which the structure has been proven,

(3) The maximum weights at which compliance with all of the applicable requirements specified is demonstrated.

(b) The maximum take-off weight and the maximum landing weight may be made variable with altitude.

§ 4b.85 *Minimum weight.* The minimum weight shall not be less than any of the following:

(a) The minimum weight selected by the applicant,

(b) The minimum design weight for which the structure has been proven,

(c) The minimum weight at which compliance with all the applicable requirements herein specified is demonstrated.

§ 4b.86 *Center of gravity position.* The fore and aft extremes of center of gravity position shall not exceed any of the following:

(a) The extremes selected by the applicant,

(b) The extremes for which the structure has been proven,

(c) The extremes at which compliance with all applicable flight requirements is demonstrated.

PERFORMANCE REQUIREMENTS

GENERAL

§ 4b.91 *Performance.* The items of performance set forth in §§ 4b.92-4b.114 shall be determined and the airplane shall comply with the corresponding requirements in the standard atmosphere and still air. The wing flap positions denoted respectively as the take-off, en route, approach, and landing positions shall be selected by the applicant and may be made variable with weight and altitude (see § 4b.354).

§ 4b.92 *Minimum requirements for certification.* An airplane may be certificated upon having established:

(a) A maximum take-off weight at sea level (see § 4b.84),

(b) A maximum landing weight at sea level (see § 4b.84),

(c) Compliance with the climb requirement of § 4b.103 (b),

(d) Take-off data at maximum sea level take-off weight, and landing data at maximum sea level landing weight, in accordance with §§ 4b.94-4b.97 (Take-off), and §§ 4b.111-4b.114 (Landing),

(e) Compliance with the requirements of all other applicable parts of this chapter.

§ 4b.93 *Definition of stalling speeds.* (a) V_{s0} denotes the true indicated stalling speed, or the minimum steady flight speed at which the airplane is controllable, in miles per hour, with:

(1) Engines idling, throttles closed (or not more than sufficient power for zero thrust set at a speed not greater than 110 percent of the stalling speed),

(2) Propellers in position normally used for take-off,

(3) Landing gear extended,

(4) Wing flaps in the landing position,

(5) Cowl flaps closed,

(6) Center of gravity in the most unfavorable position within the allowable landing range,

(7) The weight of the airplane equal to the weight in connection with which V_{s0} is being used as a factor to determine a required performance.

(b) V_{s1} denotes the true indicated stalling speed, or the minimum steady flight speed at which the airplane is controllable, in miles per hour, with:

(1) All engines idling, throttles closed (or not more than sufficient power for zero thrust set at a speed not greater than 110 percent of the stalling speed),

(2) Propellers in position normally used for take-off, the airplane in all

other respects (flaps, landing gear, etc.) in the particular condition existing in the particular test in connection with which V_{s1} is being used,

(3) The weight of the airplane equal to the weight in connection with which V_{s1} is being used as a factor to determine a required performance.

(c) These speeds shall be determined by flight tests using the procedure outlined in § 4b.151 (a).

TAKE-OFF

§ 4b.94 *Take-off data.* (a) The take-off data set forth in §§ 4b.95-4b.97 shall be determined:

(1) At all weights and altitudes desired by the applicant,

(2) With a constant take-off flap position for a particular weight and altitude,

(3) With the operating engines not exceeding their approved limitations at the particular altitude.

(b) These data, when corrected, shall assume a level take-off surface. All take-off data shall be determined on a smooth, dry, hard surfaced runway and in such a manner that reproduction of such data does not require exceptional skill or alertness on the part of the pilot.

§ 4b.95 *Speeds.* (a) The critical engine failure speed, V_1 , is a true indicated air speed, chosen by the applicant, which shall not be less than the minimum speed at which the controllability is demonstrated during take-off run to be adequate to permit proceeding safely with the take-off, using normal piloting skill, when the critical engine is suddenly made inoperative. If V_1 is equal to or greater than V_2 below, no demonstration during take-off is required.

(b) The minimum take-off climb speed, V_2 , is a true indicated air speed chosen by the applicant which shall permit the rate of climb required in § 4b.103 (a) but which shall not be less than:

(1) $1.20 V_{s1}$ for two-engine airplanes,

(2) $1.15 V_{s1}$ for airplanes having more than two engines,

(3) 1.10 times the minimum control speed, V_{mc} , established under § 4b.129 (Minimum control speed).

§ 4b.96 *Accelerate-stop distance.* The distance required to accelerate the airplane from a standing start to the speed, V_1 , and, assuming an engine to fail at this point, to stop.

Means other than wheel brakes may be used in determining this distance providing that exceptional skill is not required to control the airplane, that the manner of their employment is such that consistent results could be expected under normal service, and that they are regarded as reliable.

§ 4b.96-1 *Reverse thrust used in establishing accelerate-stop distance (CAA policies which apply to § 4b.96).* The Administrator will permit the use of reverse thrust, in combination with the brakes installed, in establishing the accelerate-stop distance, only if it can be shown that such use provides a level of safety equivalent to that contemplated by the present regulations when wheel

brakes alone are used, including proper consideration of pilot skill required and likelihood of attaining the necessary performance under conditions of simulated engine failure.

[12 F. R. 3438. Correction noted at 14 F. R. 37]

§ 4b.97 *Take-off path.* (a) The distance required to accelerate the airplane to the speed, V_2 , making the critical engine inoperative at the speed, V_1 .

(b) The horizontal distance traversed and the height attained by the airplane in the time required to retract the landing gear when operating at the speed, V_2 , with:

(1) The critical engine inoperative, its propeller windmilling with the propeller control in a position normally used during take-off.

(2) The landing gear extended.

(c) The horizontal distance traversed and the height attained by the airplane in the time elapsed from the end of element (b) until the rotation of the inoperative propeller has been stopped when:

(1) The operation of stopping the propeller is initiated not earlier than the instant the airplane has attained a total height of 50 feet above the take-off surface.

(2) The airplane speed is equal to V_2 .

(3) The landing gear is retracted.

(4) The inoperative propeller is windmilling with the propeller control in a position normally used during take-off.

(d) The horizontal distance traversed and the height attained by the airplane in the time elapsed from the end of element (c) until the limit on the use of take-off power is reached, while operating at the speed, V_2 , with:

(1) The inoperative propeller stopped.

(2) The landing gear retracted.

(e) The slope of the flight path followed by the airplane in the configuration of element (d), but drawing not more than maximum continuous power on the operating engine(s).

CLIMB

§ 4b.101 *Requirements.* Compliance shall be shown with the requirements set forth in §§ 4b.102-4b.104.

§ 4b.102 *All engines operating—(a) Flaps in en route position.* The steady rate of climb at 5,000 feet shall not be less in feet per minute than $8 V_{s0}$ with:

(1) Landing gear fully retracted.

(2) Wing flaps in the most favorable position.

(3) Cowl flaps in the position which provides adequate cooling in the hot-day condition.

(4) Center of gravity in the most unfavorable position.

(5) All engines operating at not more than maximum continuous power.

(6) Maximum take-off weight.

The steady rate of climb shall also be determined at any altitude at which the airplane may be expected to operate at any weight within the range of weights to be specified in the airworthiness certificate.

(b) *Flaps in landing position.* The steady rate of climb in feet per minute

shall be at least $0.07 V_{s0}$ at any altitude within the range for which landing weight is to be specified in the certificate, with:

(1) Landing gear extended.

(2) Wing flaps in the landing position (see §§ 4b.91 and 4b.354).

(3) Cowl flaps in the position normally used in an approach to a landing.

(4) Center of gravity in the most unfavorable position permitted for landing.

(5) All engines operating at the take-off power available at such altitude.

(6) The weight equal to maximum landing weight for that altitude.

§ 4b.103 *One engine inoperative—*

(a) *Flaps in take-off position.* The steady rate of climb in feet per minute shall be at least $0.035 V_{s1}$ at any altitude within the range for which take-off weight is to be specified in the certificate, with:

(1) The landing gear retracted.

(2) Wing flaps in the take-off position (see §§ 4b.91 and 4b.354).

(3) Cowl flaps in the position normally used during take-off.

(4) Center of gravity in the most unfavorable position permitted for take-off.

(5) The critical engine inoperative, its propeller windmilling with the propeller control in a position normally used during take-off.

(6) All other engines operating at the take-off power available at such altitude.

(7) The speed equal to the minimum take-off climb speed, V_2 , used in § 4b.95 (b).

(8) The weight equal to maximum take-off weight for that altitude.

(9) With the landing gear extended and all other conditions as described in paragraph (a) of this section, the rate of climb shall be at least 50 feet per minute.

(b) *Flaps in en route position.* The steady rate of climb in feet per minute at any altitude at which the airplane may be expected to operate, at any weight within the range of weights to be specified in the airworthiness certificate, shall be determined and shall, at a standard altitude of 5,000 feet and at the maximum take-off weight, be at least $0.02 V_{s0}$ for airplanes with a maximum take-off weight of 40,000 lbs. or less, $0.04 V_{s0}$ for airplanes with a maximum take-off weight of 60,000 lbs. or more, with a linear variation between 40,000 lbs. and 60,000 lbs., with:

(1) The landing gear retracted.

(2) Wing flaps in the most favorable position.

(3) Cowl flaps or other means of controlling the engine cooling air supply in the position which provides adequate cooling in the hot-day condition.

(4) Center of gravity in the most unfavorable position.

(5) The critical engine inoperative, its propeller stopped.

(6) All remaining engines operating at the maximum continuous power available at the altitude.

(c) *Flaps in approach position.* The steady rate of climb in feet per minute shall not be less than $0.04 V_{s0}$ at any al-

titude within the range for which landing weight is to be specified in the certificate, with:

(1) The landing gear retracted.

(2) Wing flaps set in position such that V_{s1} does not exceed $1.10 V_{s0}$.

(3) Cowl flaps in the position normally used during an approach to a landing.

(4) Center of gravity in the most unfavorable position permitted for landing.

(5) The critical engine inoperative, its propeller stopped.

(6) All remaining engines operating at the take-off power available at such altitude.

(7) The weight equal to the maximum landing weight for that altitude.

[Amdt. 04-0, 11 F. R. 71, as amended by Amdt. 4b-11, 14 F. R. 2587]

§ 4b.104 *Two engines inoperative.* For airplanes with four or more engines, the steady rate of climb at any altitude at which the airplane may be expected to operate and at any weight within the range of weights to be specified in the operating manual, shall be determined with:

(a) The landing gear retracted.

(b) Wing flaps in the most favorable position.

(c) Cowl flaps or other means of controlling the engine cooling air supply in the position which will provide adequate cooling in the hot-day condition.

(d) Center of gravity in the most unfavorable position.

(e) The two critical engines on one side of the airplane inoperative and their propellers stopped.

(f) All remaining engines operating at the maximum continuous power available at that altitude.

LANDING

§ 4b.111 *Distance.* The horizontal distance required to land and to come to a complete stop (to a speed of approximately 3 miles per hour for seaplanes or float planes) from a point at a height of 50 feet above the landing surface shall be determined for such range of weights and altitudes as the applicant may desire. In making this determination:

(a) Immediately prior to reaching the 50-foot altitude a steady gliding approach shall have been maintained, with a true indicated air speed of at least $1.3 V_{s0}$.

(b) The nose of the airplane shall not be depressed, nor the forward thrust increased by application of power after reaching the 50-foot altitude. At all times during and immediately prior to the landing, the flaps shall be in the landing position, except that after the airplane is on the landing surface and the true indicated air speed has been reduced to not more than $0.9 V_{s0}$ the flap position may be changed.

(c) The landing shall be made in such manner that there is no excessive vertical acceleration, no tendency to bounce, nose over, ground loop, porpoise or water loop, and in such manner that its reproduction shall not require any exceptional degree of skill on the part of the pilot, or exceptionally favorable conditions.

§ 4b.112 *Landplanes.* The landing distance as defined in § 4b.111 shall be determined on a dry hard surfaced runway and:

(a) The operating pressures on the braking system shall not be in excess of those approved by the manufacturer of the brakes.

(b) The brakes shall not be used in such manner as to produce excessive wear of brakes or tires.

(c) Means other than wheel brakes may be used in determining the landing distance providing that exceptional skill is not required to control the airplane, that the manner of their employment is such that consistent results could be expected under normal service, and that they are regarded as reliable.

§ 4b.112-1 *Landing distances (CAA policies which apply to § 4b.112 (c)).* See § 3.86-1 of this chapter.

[12 F. R. 3438. Correction noted at 14 F. R. 87]

§ 4b.113 *Seaplanes or float planes.* The landing distance as defined in § 4b.111 shall be determined on smooth water.

§ 4b.114 *Skiplanes.* The landing distance as defined in § 4b.111 shall be determined on smooth, dry snow.

FLIGHT CHARACTERISTICS

§ 4b.121 *Requirements.* The airplane shall meet the requirements set forth in §§ 4b.126-4b.129 at all normally expected operating altitudes under all critical loading conditions within the range of center of gravity appropriate thereto and, except as otherwise specified, at the maximum weight for which certification is sought, and there shall be no flight or operating characteristic which makes the airplane unworthy.

CONTROLLABILITY

§ 4b.126 *General.* The airplane shall be safely controllable and maneuverable during take-off, climb, level flight, dive, and landing, and it shall be possible to make a smooth transition from one flight condition to another, including turns and slips, without requiring an exceptional degree of skill, alertness, or strength on the part of the pilot and without danger of exceeding the limit load factor under all conditions of operation probable for the type, including those conditions normally encountered in the event of sudden failure of any engine. The airplane shall be demonstrated to comply with the provisions of §§ 4b.127-4b.129.

§ 4b.127 *Longitudinal control.* (a) When a tail wheel landing gear is used it shall be possible during take-off ground run, to maintain any attitude up to thrust line level at 80 percent V_{S1} when running on a concrete runway.

(b) It shall be possible at all speeds between $1.4 V_{S1}$ and V_{S1} to pitch the nose downward so that the rate of increase in air speed is satisfactory for prompt acceleration to a speed equal to $1.4 V_{S1}$ with:

(1) The airplane trimmed at $1.4 V_{S1}$ with landing gear extended,

(2) The wing flaps in a retracted and extended position,

(3) Power off and maximum continuous power on all engines.

(c) During each of the controllability demonstrations outlined below, it shall not require a change in the trim control or the exertion of more control force than can be readily applied with one hand for a short period. Each maneuver shall be performed with the landing gear extended.

(1) (i) With power off, flaps retracted, and the airplane trimmed at $1.4 V_{S1}$, the flaps are to be extended as rapidly as possible while maintaining the air speed at an adequate margin of approximately 40 percent above the stalling speed.

(ii) Repeat (1) (i) except start with flaps extended and the airplane trimmed at $1.4 V_{S1}$, then retract the flaps as rapidly as possible.

(iii) Repeat (1) (i) except using maximum continuous power.

(iv) Repeat (1) (ii) except using maximum continuous power.

(2) (i) With power off, the flaps retracted, and the airplane trimmed at $1.4 V_{S1}$, apply take-off power quickly while maintaining the same air speed.

(ii) Repeat (2) (i) except with the flaps extended.

(3) With power off, flaps extended, and the airplane trimmed at $1.4 V_{S1}$, obtain and maintain air speeds within the range of $1.1 V_{S1}$ to $1.7 V_{S1}$, or to the flap placard speed, whichever is greater.

(d) It shall be possible without the use of exceptional piloting skill to prevent loss of altitude when flap retraction from any position is initiated during steady horizontal flight at $1.1 V_{S1}$ with simultaneous application of not more than maximum continuous power.

§ 4b.128 *Lateral and directional control.* (a) It shall be possible to execute 20-degree banked turns with or against the inoperative engine from steady climb at a speed equal to $1.4 V_{S1}$, with:

(1) The critical engine inoperative and its propeller in the minimum drag condition,

(2) Maximum continuous power on the operating engines,

(3) Most unfavorable center of gravity,

(4) Landing gear retracted and extended,

(5) Wing flaps in the most favorable climb position,

(6) Maximum take-off weight.

(b) In the configuration outlined in paragraph (a) of this section, it shall be possible, while holding the wings level laterally, to execute sudden changes in heading in either direction without dangerous characteristics being encountered. This shall be demonstrated at a speed equal to $1.4 V_{S1}$ at landing weight, approach flaps, one engine inoperative, gear retracted, and power for level flight at $1.4 V_{S1}$, up to heading changes of 15° , except that the heading change at which the rudder pedal force is 180 pounds need not be exceeded.

(c) Airplanes with four or more engines installed shall comply with para-

graphs (a) and (b) of this section with the two critical engines inoperative, at an airplane weight at which the rate of climb is equal to at least $.01 V_{S0}^2$ at an altitude of 5,000 feet with the landing gear retracted and the wing flaps in the most favorable position.

§ 4b.129 *Minimum control speed.* (V_{mc}). (a) The minimum speed after recovery at which the airplane can be maintained in straight flight with zero yaw (or, at the option of the applicant, with a bank not in excess of 5°) after any one engine is suddenly made inoperative during steady flight at that speed, shall be determined and shall not exceed $1.2 V_{S1}$ with:

(1) Take-off or maximum available power in all engines,

(2) Rearmost center of gravity,

(3) Flaps in take-off position,

(4) Landing gear retracted.

(b) In demonstrating this minimum speed, the rudder force required to maintain it shall not exceed 180 pounds, nor shall it be necessary to throttle the remaining engines. During recovery the airplane shall not assume any dangerous attitude, nor shall it require exceptional skill, strength, or alertness on the part of the pilot to prevent a change of heading in excess of 20° before recovery is complete.

TRIM

§ 4b.136 *Requirements.* The means used for trimming the airplane shall be such that after being trimmed and without further pressure upon or movement of either the primary control or its corresponding trim control by the pilot or the automatic pilot, the airplane will maintain:

(a) Lateral and directional trim under all conditions of operation consistent with the intended use of the airplane including operation at any speed from $1.4 V_{S1}$ to at least 90 percent of high speed and operation in which there is greatest lateral variation in the distribution of the useful load.

(b) Longitudinal trim under the following conditions:

(1) During a climb with maximum continuous power at a speed not in excess of $1.4 V_{S1}$ with the landing gear retracted and the wing flaps both retracted and in the take-off position.

(2) During a glide with power off at a speed not in excess of $1.4 V_{S1}$, with the landing gear extended and the wing flaps both retracted and extended under the forward center of gravity position approved for landing with the maximum landing weight and under the most forward center of gravity position approved for landing, regardless of weight.

(3) During level flight at any speed from $1.4 V_{S1}$ to 90 percent of the high speed with the landing gear both retracted and extended and wing flaps retracted.

(c) Longitudinal and directional trim at a speed equal to $1.4 V_{S1}$, during climbing flight with the critical engine inoperative, with:

(1) The other engine(s) at maximum continuous power,

(2) The landing gear retracted,

(3) Wing flaps retracted.

(d) Rectilinear flight at the climb speed, configuration, and power used in establishing the rates of climb in § 4b.104, the most unfavorable center of gravity position, and the weight at which the two-engine inoperative climb is equal to at least $.01 V_{s1}^2$ at an altitude of 5,000 feet.

STABILITY

§ 4b.141 *General.* The airplane shall be longitudinally, directionally, and laterally stable in accordance with §§ 4b.142-4b.145. Suitable stability and control "feel" (static stability) may be required in other conditions normally encountered in service if flight tests show such stability to be necessary for safe operation.

§ 4b.142 *Static longitudinal stability.* In the configurations outlined in § 4b.143, and with the airplane trimmed as indicated, the characteristics of the elevator control forces and friction shall be as described in paragraphs (a) and (b) of this section.

(a) A pull shall be required to obtain and maintain speeds below the specified trim speed and a push to obtain and maintain speeds above the specified trim speed. This shall be so at any speed which can be obtained without excessive control force except that such speeds need not be greater than the appropriate maximum permissible speed or less than the minimum speed in steady unstalled flight.

(b) The air speed shall return to within 10% of the original trim speed when the control force is slowly released from any speed within the limits defined in paragraph (a) of this section.

§ 4b.143 *Specific conditions.* In paragraphs (a), (b) and (c) of this section, within the speeds specified, the stable slope of stick force curve versus speed shall be such that any substantial change in speed is clearly perceptible to the pilot through a resulting change in stick force.

(a) *Landing.* The stick force curve shall have a stable slope and the stick force shall not exceed 80 pounds at any speed between $1.1 V_{s1}$ and $1.8 V_{s1}$ with:

- (1) Wing flaps in the landing position,
- (2) The landing gear extended,
- (3) Maximum sea level landing weight,
- (4) Throttles closed on all engines,
- (5) The airplane trimmed at $1.4 V_{s1}$ with throttles closed.

(b) *Approach.* The stick force curve shall have a stable slope at all speeds between $1.1 V_{s1}$ and $1.8 V_{s1}$ with:

- (1) Wing flaps in sea level approach position,
- (2) Landing gear retracted,
- (3) Maximum sea level landing weight,
- (4) The airplane trimmed at $1.4 V_{s1}$ and with power sufficient to maintain level flight at this speed.

(c) *Climb.* The stick force curve shall have a stable slope at all speeds between $1.2 V_{s1}$ and $1.6 V_{s1}$ with:

- (1) Wing flaps retracted,
- (2) Landing gear retracted,
- (3) Maximum sea level take-off weight,
- (4) 75% of maximum continuous power,
- (5) The airplane trimmed at $1.4 V_{s1}$.

(d) *Cruising.* (1) Between $1.3 V_{s1}$ and the maximum permissible speed, the stick force curve shall have a stable slope at all speeds obtainable with a stick force not in excess of 50 pounds, with:

- (i) Landing gear retracted,
- (ii) Wing flaps retracted,
- (iii) Maximum sea level take-off weight,
- (iv) 75% of maximum continuous power,
- (v) The airplane trimmed for level flight with 75% of the maximum continuous power.

(2) Same as subparagraph (1) of this paragraph except that the landing gear shall be extended and the level flight trim speed need not be exceeded.

§ 4b.144 *Dynamic longitudinal stability.* Any short period oscillation occurring between stalling speed and maximum permissible speed shall be heavily damped with the primary controls in (a) free, and (b) in a fixed position.

§ 4b.145 *Directional and lateral stability.* (a) The static directional stability, as shown by the tendency to recover from a skid with rudder free, shall be positive with all landing gear and flap positions and symmetrical power conditions, at all speeds from $1.2 V_{s1}$ up to the maximum permissible speed.

(b) The static lateral stability, as shown by the tendency to raise the low wing in a sideslip, shall be positive within the same limits.

(c) In straight steady sideslips (unaccelerated forward slips), the aileron and rudder control movements and forces shall be substantially proportional to the angle of sideslip and the factor of proportionality shall lie between satisfactory limits up to sideslip angles considered appropriate to the operation of the type. At greater angles up to that at which the full rudder control is employed or a rudder pedal force of 180 pounds is obtained, the rudder pedal forces shall not reverse, and increased rudder deflection shall produce increased angles of sideslip.

(d) Sufficient bank shall accompany sideslipping to indicate adequately any departure from steady unyawed flight unless a yaw indicator is provided.

(e) Any short period oscillation occurring between stalling speed and maximum permissible speed shall be heavily damped with the primary controls in (1) free, and (2) in a fixed position.

STALLS

§ 4b.151 *Stalling demonstration.* (a) Stalls shall be demonstrated under two conditions:

- (1) With power off,
- (2) With that power necessary to maintain level flight at a speed of $1.6 V_{s1}$ with flaps in approach position, landing gear retracted, maximum landing weight.

(b) In either condition it shall be possible, with flaps and landing gear in any position, center of gravity in the most unfavorable position for recovery and with appropriate airplane weights and the airplane in straight flight and in turns up to 30° bank, to produce and to cor-

rect roll and yaw by unreversed use of the aileron and rudder controls in the maneuver described below up to the time when the airplane pitches. In straight flight stalls the average amount of roll occurring between the initiation of the pitching movement and the completion of the recovery shall not exceed 20° . The roll following the stall during turning flight must not be so violent or extreme as to make it difficult, with normal piloting skill, to make a prompt recovery and regain control of the airplane.

(c) Clear and distinctive stall warning shall be apparent to the pilot at a speed at least 5% above the stalling speed, with flaps and landing gear in any position, both in straight and turning flight. The warning may be furnished either through the inherent aerodynamic qualities of the airplane, by a suitable instrument, or in any equivalent fashion which will give clearly distinguishable indications under all conditions of flight that are to be expected in air-line operations.

(d) In demonstrating these qualities, the order of events shall be:

(1) With trim controls adjusted for straight flight at a speed of $1.4 V_{s1}$, reduce speed by means of the elevator control until the speed is steady at slightly above stalling speed; then,

(2) Pull elevator control back at a rate such that the airplane speed reduction does not exceed 1 mile per hour per second until a stall is produced as evidenced by an uncontrollable downward pitching motion of the airplane, or until the control reaches the stop. Normal use of the elevator control for recovery may be made after such pitching motion is unmistakably developed.

§ 4b.152 *Stall test; one engine inoperative.* The airplane shall be safely recoverable without applying power to the inoperative engine when stalled with:

- (a) The critical engine inoperative,
- (b) Flaps and landing gear retracted,
- (c) The remaining engines operating at up to 75% of maximum continuous power, except that the power need not be greater than that at which the use of maximum control travel does not hold the wings laterally level. The operating engines may be throttled back during the recovery from the stall.

GROUND AND WATER CHARACTERISTICS

§ 4b.161 *Requirements.* All airplanes shall comply with the requirements of §§ 4b.162-4b.166.

§ 4b.162 *Longitudinal stability and control.* (a) There shall be no uncontrollable tendency for landplanes to nose over in any operating condition reasonably expected for the type or when rebound occurs during landing or take-off. Wheel brakes shall operate smoothly and shall exhibit no undue tendency to induce nosing over.

(b) Seaplanes shall exhibit no uncontrollable porpoising at any speed at which the airplane is normally operated on the water.

§ 4b.163 *Directional stability and control.* (a) There shall be no uncontrollable or dangerous looping tendency in 90° cross winds up to $0.2 V_{s0}$ at any necessary speed upon the ground or water.

(b) All landplanes shall be demonstrated to be satisfactorily controllable with no exceptional degree of skill or alertness on the part of the pilot in power-off landings, at normal landing speed, during which brakes or engine power are not used to maintain a straight path.

(c) Means shall be provided for adequate directional control during taxiing.

§ 4b.164 *Shock absorption.* The shock absorbing mechanism shall not produce damage to the structure when the airplane is taxied on the roughest ground which it is reasonable to expect the airplane to encounter in normal operation.

§ 4b.165 *Spray characteristics.* For seaplanes, spray during taxiing, take-off, or landing shall at no time dangerously obscure the vision of the pilots nor produce damage to the propeller or other parts of the airplane.

§ 4b.166 *Critical cross wind.* There shall be established a critical cross component of wind velocity at which it has been demonstrated to be safe to take-off or land.

FLUTTER AND VIBRATION

§ 4b.171 *Flutter and vibration.* All parts of the airplane shall be demonstrated to be free from flutter and excessive vibration under all speed and power conditions appropriate to the operation of the airplane up to at least the minimum value permitted for V_d in § 4b.189. There shall also be no buffeting condition in any normal flight condition severe enough to interfere with the satisfactory control of the airplane, or to cause excessive fatigue to the crew or structural damage. However, buffeting as stall warning is considered desirable, and discouragement of this type of buffeting is not intended.

SUBPART C—STRENGTH REQUIREMENTS GENERAL

§ 4b.176 *Loads.* Strength requirements are specified in terms of limit and ultimate loads. Limit loads are the maximum loads anticipated in service. Ultimate loads are equal to the limit loads multiplied by the factor of safety. When not otherwise described, loads specified are limit loads. Unless otherwise provided, the specified air, ground, and water loads shall be placed in equilibrium with inertia forces, considering all items of mass in the airplane. All such loads shall be distributed in a manner closely approximating or conservatively representing actual conditions. If deflections under load would significantly change the distribution of external or internal loads, such redistribution shall be taken into account.

§ 4b.177 *Factor of safety.* The factor of safety shall be 1.5 unless otherwise specified.

§ 4b.178 *Strength and deformations.* The structure shall be capable of supporting limit loads without suffering detrimental permanent deformations. At all loads up to limit loads the deformation shall be such as not to interfere

with safe operation of the airplane. The structure shall be capable of supporting ultimate loads without failure for at least 3 seconds.

§ 4b.179 *Proof of structure.* Proof of compliance of the structure with the strength and deformation requirements of § 4b.178 shall be made for all critical loading conditions. Proof of compliance by means of structural analysis will be accepted only when the structure conforms with types for which experience has shown such methods to be reliable. In all other cases substantiating tests are required. In all cases certain portions of the structure must be tested as specified in Subpart D.

FLIGHT LOADS

§ 4b.186 *General.* Flight load requirements shall be complied with at critical altitudes within the range for which certification is desired, and at all weights between the minimum design weight and design take-off weight with any practicable distribution of disposable load within prescribed operating limita-

tions stated in the airplane operating manual. (See Subpart G.)

§ 4b.187 *Definition of flight load factor.* The flight load factors specified represent the acceleration (in terms of the gravitational constant) normal to the assumed longitudinal axis of the airplane equal in magnitude and opposite in direction to the airplane inertia load factor at the center of gravity.

SYMMETRICAL FLIGHT CONDITIONS (FLAPS RETRACTED)

§ 4b.188 *General.* The strength requirements shall be met at all combinations of air speed and load factor on and within the boundaries of the $V-n$ diagrams of Figures 4b-1 and 4b-2 which represent the envelopes of the flight loading conditions specified by the maneuvering and gust criteria of §§ 4b.190, 4b.191 and 4b.193. These diagrams will also be used in determining the airplane structural operating limitations as specified in Subpart G.

§ 4b.189 *Design air speeds.* The design air speeds shall be chosen by the

FIGURE 4b-1.—MANEUVERING ENVELOPE (see § 4b.190), LOAD FACTOR VS. VELOCITY ($V-n$) DIAGRAM.

FIGURE 4b-2.—GUST ENVELOPE (see § 4b.191), LOAD FACTOR VS. VELOCITY ($V-n$) DIAGRAM.

designer except that they shall not be less than the following values:

V_f (design flap speed) = $1.4 V_{s_1}$ or $1.8 V_{s_0}$, whichever is greater, where

V_{s_1} = stalling speed, flaps retracted at design landing weight

V_{s_0} = stalling speed, flaps in landing position, design landing weight

(See § 4b.193 for provision concerning automatic flap operation.)

V_p (design maneuvering speed) = V_{s_1} $V-n$

where n = limit maneuvering load factor used in design (see § 4b.190)

V_{s_1} = stalling speed with flaps retracted at design take-off weight

V_b (design speed for 40 feet per second gust) the speed at which the effective 40 feet per second gust line intersects the positive C_{Nmax} curve on the gust $V-n$ envelope (see § 4b.191 and Figure 4b-2).

V_c (design cruising speed) V_c shall not be less than V_b plus 50 except that it need not exceed the speeds at altitude corresponding to a Mach number of 0.52 or the high speed of the airplane in level flight at maximum continuous power for the corresponding altitude. However, in no case shall V_c be less than $1.3 V_{s_1}$ with flaps retracted at design take-off weight.

V_d (design dive speed) V_d shall be 1.25 times the value selected for V_c or the selected V_c plus 70 miles per hour, whichever is greater; however V_d need not exceed the speed corresponding to a Mach number of 0.65. In any event, V_d need not exceed the terminal velocity in a dive at 30 degrees to the horizontal. At all speeds in excess of those corresponding to a Mach number of 0.65 compressibility effects shall be taken into account.

§ 4b.190 *Maneuvering envelope.* (a) The airplane shall be assumed to be subjected to symmetrical maneuvers resulting in the following limit load factors except where limited by maximum (static) lift coefficients:

(1) The positive maneuvering load factor, n , at all speeds up to V_d . The value of n shall be selected by the designer except that it shall not be less than 2.5.

(2) The negative maneuvering load factor shall have a minimum value of -1.0 at all speeds up to V_c ; and factors varying linearly with speed from the specified value at V_c to 0.0 at V_d .

(b) Lower values of maneuvering load factor may be employed only if it be proven that the airplane embodies features of design which make it impossible to exceed such values in flight.

§ 4b.191 *Gust envelope.* The airplane shall be assumed to encounter symmetrical vertical gusts as specified below while in level flight. The resulting loads shall be considered limit loads.

(a) Positive (up) and negative (down) gusts of 40 feet per second nominal intensity at the speed, V_b , where the 40 feet per second gust line intersects the positive C_{Nmax} curve. If this gust intensity produces load factors greater than those obtained in condition (b) following, it may be modified at altitudes above 20,000 feet in such a manner as to produce a load factor not less than that obtained in condition (b).

(b) Positive and negative gusts of 30 feet per second at V_c .

(c) Positive and negative 15 feet per second gusts at V_d . Gust load factors shall be assumed to vary linearly between

the specified conditions as shown on the gust envelope of Figure 4b-2.

§ 4b.192 *Gust load factors.* In applying the gust requirements, the gust load factors shall be computed by the following formula:

$$n = 1 + \frac{KUV_a}{575(W/S)}$$

Where:

$$K = \frac{1}{2} \left(\frac{W}{S} \right)^{1/4} \text{ (for } W/S < 16 \text{ p. s. f.)}$$

$$= 1.33 - \frac{2.67}{(W/S)^{1/4}} \text{ (for } W/S > 16 \text{ p. s. f.)}$$

U = nominal gust velocity, feet per second.

(Note that the "effective sharp edged" gust equals KU)

V = airplane speed, miles per hour.

a = slope of airplane normal force coefficient curve, C_{NA} per radian, corrected for aspect ratio

W/S = wing loading, pounds per square foot

HIGH LIFT DEVICES EXTENDED CONDITIONS

§ 4b.193 *High lift devices extended.* When flaps or similar high lift devices intended for use at the relatively low air speeds of approach, landing, and take-off are installed, the airplane shall be assumed to be subjected to symmetrical maneuvers and gusts with the flaps in landing position at the design flap speed, V_f , resulting in limit load factors within the range determined by the following conditions:

(a) Maneuvering to a positive limit load factor of 2.0.

(b) Positive and negative 15 feet per second nominal intensity gusts acting normal to the flight path in level flight. The gust load factors shall be computed by the formula of § 4b.192. In designing the flaps and supporting structures, slipstream effects must be taken into account as specified in § 4b.221. When automatic flap operation is provided, the airplane may be designed for the speeds and corresponding flap positions which the mechanism permits. (See §§ 4b.2, 4b.354 and 4b.355.)

INVESTIGATION OF SPECIFIC CONDITIONS

§ 4b.196 *General.* (a) A sufficient number of points on the maneuvering and gust envelopes shall be investigated to insure that the maximum load for each member of the airplane structure has been obtained. A conservative combined envelope may be used for this purpose if desired. At least the conditions specified in §§ 4b.197-4b.198 shall be investigated unless shown to be non-critical.

(b) All significant forces acting on the airplane shall be placed in equilibrium in a rational or conservative manner. At least the following forces shall be considered in establishing such equilibrium:

(1) Linear inertia forces in equilibrium with wing and horizontal tail surface loads.

(2) Pitching (angular) inertia forces in equilibrium with wing and fuselage aerodynamic moments and horizontal tail surface loads.

(c) Terms used in §§ 4b.197 (b) and 4b.198 are defined as follows:

(1) A "balancing tail load" is that necessary to place the airplane in equilibrium with zero pitching acceleration.

(2) A "checked maneuver" is one in which the pitching control is suddenly

displaced in one direction and then suddenly moved in the opposite direction, the deflections and timing being such as to avoid exceeding the limit maneuvering load factor.

(d) Where sudden displacement of a control is specified, the assumed rate of displacement need not exceed that which would actually be applied by the pilot.

§ 4b.197 *Maneuvering conditions—* (a) *Balanced conditions.* The maneuvering conditions A through I on the maneuvering envelope (Fig. 4b-1) shall be investigated assuming the airplane in equilibrium with zero pitching acceleration.

(b) *Pitching conditions.* The following conditions on Figure 4b-1 involving pitching acceleration shall be investigated.

(1) A_1 , *Unchecked pull-up at speed, V_p .* The airplane shall be assumed to be flying in steady level flight and the pitching control suddenly moved to obtain extreme positive pitching, except as limited by pilot effort, § 4b.217.

(2) A_2 , *Checked maneuver at speed, V_p .* The airplane shall be assumed to be maneuvered to the limit positive maneuvering load factor by a checked maneuver from an initial condition of steady unaccelerated flight. The initial positive pitching portion of this maneuver may be considered covered by subparagraph (1) of this paragraph.

A negative pitching acceleration of at least the following value shall be assumed to be attained concurrently with the airplane limit maneuvering load factor, unless it is shown that a lesser value could not be exceeded:

$$-\frac{30}{V_p} n (n-1.5) \text{ (radians/sec}^2\text{)}$$

(3) D_1 and D_2 , *Checked maneuver at V_d .* The airplane shall be assumed to be maneuvered to the limit positive maneuvering load factor by a checked maneuver from steady unaccelerated flight.

Positive and negative pitching accelerations of at least the following values shall be assumed to be attained concurrently with the specified airplane load factors, unless it is shown that lesser values could not be exceeded:

$$\text{Condition } D_1: +\frac{45}{V_d} n (n-1.5) \text{ (radians/sec}^2\text{)}$$

with the airplane at unity load factor.

$$\text{Condition } D_2: -\frac{30}{V_d} n (n-1.5) \text{ (radians/sec}^2\text{)}$$

with the airplane at maneuvering load factor.

where n = limit maneuvering load factor in both equations.

§ 4b.198 *Gust conditions.* The gust conditions B' through J' on Figure 4b-2 shall be investigated. The air load increment due to a specified gust shall be added to the initial balancing tail load corresponding to steady unaccelerated flight. The alleviating effects of wing downwash may be included in computing the tail gust load increment.

UNSYMMETRICAL FLIGHT CONDITIONS

§ 4b.200 *Unsymmetrical flight conditions.* The airplane shall be assumed to be subjected to rolling and yawing maneuvers as described in the following conditions in §§ 4b.201 and 4b.202. Un-

balanced aerodynamic moments about the center of gravity shall be reacted in a rational or conservative manner considering the principal masses furnishing the reacting inertia forces.

§ 4b.201 *Rolling conditions.* (a) The airplane shall be designed for the loads resulting from the following aileron deflections and speeds (except as limited by pilot effort as specified in § 4b.217) in combination with an airplane load factor of at least two-thirds of the positive maneuvering factor used in the design of the airplane.

(1) At speed, V_p , assume a sudden displacement of the aileron to the stop. A simplified condition of zero rolling velocity or the actual resulting dynamic condition may be used for design.

(2) When V_c is greater than V_p , the aileron deflection at V_c shall be that required to produce a rate of roll not less than that which would be obtained at the speed and aileron deflection specified in paragraph (a) of this section.

(3) At speed, V_d , the aileron deflection shall be that required to produce a rate of roll not less than $\frac{1}{3}$ of that which would be obtained at the speed and aileron deflection specified in paragraph (a) of this section.

(b) To cover unsymmetrical gusts, the airplane shall be designed for loads obtained by modifying the symmetrical flight condition A shown on Figure 4b-1 by assuming 100% of the wing air load acting on one side of the airplane and 90% on the other.

§ 4b.202 *Yawing conditions.* The airplane shall be designed for the yawing loads resulting from the conditions in paragraphs (a) and (b) of this section.

(a) *Maneuvering loads.* At all speeds from V_{mc} to V_p the following vertical tail loads shall be considered:

(1) (i) With the airplane in unaccelerated flight at zero yaw, assume a sudden displacement of the rudder control to the maximum deflection as limited by the control stops or a 300 lb. rudder pedal force, whichever is critical.

(ii) In the conditions set forth in subparagraphs (2) and (3) of this paragraph it shall be assumed that the airplane yaws to a sideslip angle resulting from the application of the above rudder angle.

(2) Assume that the airplane yaws to the above sideslip angles while the rudder control is maintained at full deflection (except as limited by pilot effort) in the direction tending to increase the sideslip.

(3) Assume that the airplane yaws to the above sideslip angles with the rudder control in the neutral position, except as limited by the pilot effort.

(4) Yawing velocity may be assumed zero in conditions set forth in this paragraph.

(b) *Lateral gusts.* (1) The airplane shall be assumed to encounter gusts of 30 feet per second nominal intensity, normal to the plane of symmetry while in unaccelerated flight at speed, V_c .

(2) The gust loading on the vertical tail surfaces shall be computed by the following formula:

$$W = \frac{KUV_c a}{575}$$

Where:

W —average limit unit pressure in pounds per square foot.

$$K = 1.33 - \frac{4.5}{\left(\frac{W}{S_v}\right)^{3/4}}$$

except that K shall not be less than 1.0. A value of K obtained by rational determination may be used.

U —nominal gust intensity in feet per second.

V_c —design cruising speed in miles per hour.

a —slope of lift curve of vertical surface in radians corrected for aspect ratio.

S_v —vertical surface area, square feet.

W —design take-off weight, pounds.

[Amdt. 04-0, 11 F. R. 71, as amended by Amdt. 04b-5, 12 F. R. 3933]

SUPPLEMENTARY FLIGHT CONDITIONS

§ 4b.206 *Engine torque effects.* (a) Engine mounts and their supporting structures shall be designed for engine torque effects combined with certain basic flight conditions as described in subparagraphs (1) and (2) of this paragraph. Engine torque may be neglected in the other flight conditions.

(1) The limit torque corresponding to take-off power and propeller speed acting simultaneously with 75% of the limit loads from flight condition A (see Fig. 4b-1).

(2) The limit torque corresponding to maximum continuous power and propeller speed, acting simultaneously with the limit loads from flight condition A (see Fig. 4b-1).

(b) The limit torque shall be obtained by multiplying the mean torque by a factor of 1.33 in the case of engines having 5 or more cylinders. For 4-, 3-, and 2-cylinder engines, the factors shall be 2, 3, and 4, respectively.

§ 4b.207 *Side load on engine mount.* The limit load factor in a lateral direction for this condition shall be at least equal to the maximum obtained in the unsymmetrical flight (yawing) conditions but shall not be less than either $\frac{1}{3}$ the limit load factor for flight condition A (see Fig. 4b-1) or 1.33. Engine mounts and their supporting structures shall be designed for this condition which may be assumed independent of other flight conditions.

§ 4b.208 *Pressure cabin loads.* See § 4b.451 (a).

CONTROL SURFACE LOADS

§ 4b.216 *General.* The control surfaces shall be designed for the limit loads resulting from the symmetrical and unsymmetrical flight condition as described in §§ 4b.196 and 4b.200 with the provisions set forth in §§ 4b.217-4b.223.

§ 4b.217 *Pilot effort.* In the control surface flight loading conditions, the airloads on the movable surfaces and the corresponding deflections need not exceed those which could be obtained in flight by employing the maximum pilot control forces specified in Figure 4b-3, except that two-thirds of the maximum values specified for the aileron and elevator may be used when reliable control

surface hinge moment data are available. In applying this criterion, proper consideration shall be given to the effects of servo mechanisms, tabs, and automatic pilot systems in assisting the pilot.

§ 4b.218 *Trim tab effects.* The effects of trim tabs on the control surface design conditions need be taken into account only in cases where the surface loads are limited on the basis of maximum pilot effort in accordance with the provision of § 4b.217. In such cases the tabs shall be considered to be deflected in the direction which would assist the pilot and the deflections shall be those specified in § 4b.222.

§ 4b.219 *Unsymmetrical loads.* The maximum horizontal tail surface loading (that is, load per unit area) as determined by §§ 4b.216-4b.218 shall be applied to the horizontal surfaces on one side of the plane of symmetry and 80% of that loading shall be applied to the opposite side.

§ 4b.220 *Outboard fins.* When outboard fins are carried on the horizontal tail surface, the tail surfaces shall be designed for the maximum horizontal surface load in combination with the corresponding loads induced on the vertical surfaces by end plate effects. Such induced effects need not be combined with other vertical surface loads. When outboard fins extend above and below the horizontal surface, the maximum vertical surface loading (load per unit area) as determined by § 4b.216 shall be applied to the portion of the vertical surfaces above (or below) the horizontal surface, and 80% below (or above) the horizontal surface.

§ 4b.221 *Wing flaps.* Wing flaps, their operating mechanism and supporting structure shall be designed for critical loads occurring in the high lift devices extended conditions (§ 4b.193) with the flaps extended to any position from fully retracted to landing position. The effects of propeller slipstream corresponding to take-off power shall be taken into account at an airplane speed of not less than $1.4 V_{s1}$, where V_{s1} is the stalling speed with flaps retracted at the appropriate weight, that is, landing weight for landing, and approach settings, and take-off for take-off setting. (For automatic flaps, see § 4b.193.)

§ 4b.222 *Tabs.* At all speeds up to V_d , elevator trim tabs shall be designed for the deflections required to trim the airplane at any point within the positive portion of the $V-n$ diagram (Fig. 4b-1), except as limited by the stops. Aileron and rudder trim tabs shall be designed for deflections required to trim the airplane in appropriate unsymmetrical lateral loading and rigging, and symmetrical and unsymmetrical power conditions. Balancing and servo tabs shall be designed for deflections consistent with the primary control surface loading conditions.

§ 4b.223 *Special devices.* The loading for special devices employing aerodynamic surfaces, such as slots and spoilers, shall be based on test data.

CONTROL SYSTEM LOADS

§ 4b.231 *Primary flight controls and systems.* (a) Flight control systems and supporting structures shall be designed for loads corresponding to 125% of the computed hinge moments of the movable control surface in the conditions prescribed in §§ 4b.216-4b.223, subject to the following maxima and minima:

(1) The system limit loads, except the loads resulting from ground gusts, § 4b.233, need not exceed those which can be produced by the pilot or pilots and automatic devices operating the controls.

(2) The loads shall in any case be sufficient to provide a rugged system for service use, including considerations of jamming, ground gusts, taxiing tail to wind control inertia, and friction.

(b) Acceptable maximum and minimum pilot loads for elevator, aileron, and rudder controls are shown in Figure 4b-3. These pilot loads shall be assumed to act at the appropriate control grips or pads in a manner simulating flight conditions and to be reacted at the attachment of the control system to the control surface horn.

§ 4b.232 *Dual controls.* (a) When dual controls are provided, the system shall be designed for the pilots operating in opposition, using individual pilot loads equal to 75% of those obtained in accordance with § 4b.231 except that the individual pilot loads shall not be less than the minimum loads specified in Figure 4b-3.

(b) In addition the control system (but not the control surfaces) shall be designed for the pilots acting in conjunction, using individual pilot loads equal to 75% of those obtained in accordance with § 4b.231.

§ 4b.233 *Ground gust conditions.* (a) The following ground gust conditions, intended to simulate the loadings on control surfaces due to ground gusts and taxiing tail to wind, shall be investigated. The limit hinge moment, H , shall be obtained from the following formula:

$$H = KcSq,$$

where

H —limit hinge moment (foot-pounds)

c —Mean chord (aft) of the control surface aft of the hinge line

S —area of control surface (square feet) aft of the hinge line

q —dynamic pressure (pounds per square foot) to be based on a design speed not less than $10\sqrt{W/S} + 10$, miles per hour, except that the design speed need not exceed 60 miles per hour

K —Factor as specified below:

Surface	K	Remarks
Aileron	+0.75	Control column locked or lashed in mid-position.
	±0.50	Ailerons at full throw + moment on one aileron - moment on other.
Elevator	±0.75	Elevator (a) full up, and (b) full down.
Rudder	±0.75	Rudder (a) in neutral and (b) at full throw.

(b) As used above in connection with ailerons and elevators, a positive value of K indicates a moment tending to depress the surface while a negative value of K

indicates a moment tending to raise the surface.

LIMIT PILOT LOADS

Control	Maximum load	Minimum load
Aileron:		
Stick	100lbs.	40lbs.
Wheel ¹	80 D in./lbs. ²	40 D in./lbs.
Elevator:		
Stick	250lbs.	100lbs.
Wheel	300lbs.	100lbs.
Rudder:		
Stick	300lbs.	130lbs.

¹ The critical portions of the aileron control system shall also be designed for a single tangential force having a limit value equal to 1.25 times the couple force determined from the above criteria.

² D = wheel diameter.

FIGURE 4b-3. PILOT CONTROL FORCE LIMITS.

§ 4b.234 *Secondary controls and systems.* Secondary controls, such as wheel brakes, spoilers, and tab controls shall be designed for the loads based on the maximum which a pilot is likely to apply to the control in question. The values of Figure 4b-4 may be used.

SECONDARY CONTROLS

Control	Limit pilot loads
Miscellaneous: ¹ Crank wheel or lever.	$\frac{1+R}{3} \times 50$ lb., but not less than 50 lb. nor more than 150 lb. (R = radius). Applicable to any angle within 20 degrees of plane of control.
Twist	133 in./lbs.
Push-pull	No requirement—leave to discretion of designer.

¹ Limited to flap, tab, stabilizer, spoiler, and landing gear operating controls.

FIGURE 4b-4. PILOT CONTROL FORCE LIMITS.

GROUND LOADS

§ 4b.241 *Limit loads.* The limit loads specified in §§ 4b.242-4b.255 shall be considered as the minimum acceptable structural requirements for landing and ground handling conditions. These limit loads shall be considered as external forces applied to the airplane structure and shall be placed in equilibrium by linear and angular inertia forces in a rational or conservative manner.

§ 4b.242 *Design weights.* The critical center of gravity position within the limits for which certification is desired shall be selected so that the maximum design loads in each of the landing gear elements are obtained for both the design landing weight and the design take-off weight, as defined in § 4b.54.

§ 4b.243 *Load factor for landing conditions.* (a) In the following landing conditions the limit vertical inertia load factor at the center of gravity of the airplane shall be chosen by the designer, but shall not be less than the value which would be obtained when landing the airplane with a descent velocity as follows:

(1) Landing at the design landing weight with a limit descent velocity of 10 feet per second.

(2) Landing at the design take-off weight with a limit descent velocity of 6 feet per second.

(b) Wing lift not exceeding $\frac{2}{3}$ of the airplane weight may be assumed to exist throughout the landing impact and may,

if desired, be assumed to act through the airplane center of gravity. The ground reaction load factor is then equal to the inertia load factor minus the ratio of the assumed wing lift to the airplane weight. (See § 4b.372 for requirements concerning the energy absorption tests which determine the minimum limit inertia load factors corresponding to the required limit descent velocities.)

(c) The requirements of paragraph (a) and (b) of this section are predicated on conventional arrangements of main and nose gears, or main and tail gears, and normal operating techniques. These velocities may be appropriately modified if it can be shown that the airplane embodies features of design which make it impossible to develop these velocities, in which case lower values may be used subject to the approval of the Administrator.

§ 4b.244 *Landing cases and attitudes.* The airplane shall be assumed to contact the ground with the specified vertical velocities in the attitudes described in §§ 4b.245-4b.248.

§ 4b.245 *Level landing—(a) General.* In the level attitude, the airplane shall be assumed to contact the ground with the rates of descent specified in § 4b.243 at a forward velocity component parallel to the ground equal to 1.2 V_{st} . The following two combinations of vertical and drag components shall be considered acting at the axle center line:

(1) *Condition of maximum wheel spin-up load.* Drag components simulating the forces required to accelerate the wheel rolling assembly up to the specified ground speed shall be combined with the vertical ground reactions existing at the instant of peak drag loads. This condition may be considered to apply only to the landing gear and the directly affected attaching structure.

(2) *Condition of maximum wheel vertical load.* An aft acting drag component not less than 25% of the maximum vertical ground reaction shall be combined with the maximum ground reaction of § 4b.243.

(b) *Tail wheel type.* The airplane horizontal reference line shall be assumed horizontal. Two conditions shall be investigated (see Fig. 4b-5):

(1) Condition of maximum wheel spin-up load.

(2) Condition of maximum wheel vertical load.

(c) *Nose wheel type.* Two airplane attitudes shall be considered (see Fig. 4b-6):

(1) Main wheels contacting the ground with the nose wheel just clear of the ground. Two conditions shall be investigated:

(i) Condition of maximum wheel spin-up load.

(ii) Condition of maximum wheel vertical load.

(2) Nose and main wheels contacting the ground simultaneously. (Unless such an attitude cannot reasonably be attained at the specified descent and forward velocities.) Two conditions shall be investigated:

(i) Condition of maximum wheel spin-up load. The nose and main gear may be investigated separately for this

condition neglecting pitching moments due to wheel spin-up loads.

(ii) Condition of maximum wheel vertical load. The pitching moment shall be assumed to be resisted by the nose gear.

§ 4b.246 *Tail-down landing.* The following conditions shall be investigated for the limit vertical landing gear load factor obtained in § 4b.243 with the vertical ground reactions applied to the landing gear axles.

(a) *Tail wheel type.* The main and tail wheels shall be assumed contacting the ground simultaneously. (See Fig. 4b-7.) The ground reaction on the tail wheel, as determined from the above, shall be assumed to act in the following directions: (1) Vertical, (2) up and aft through the axle at 45° to the ground line.

(b) *Nose wheel type.* The airplane shall be at the stalling attitude or the maximum angle permitting clearance of the ground by all parts of the airplane, whichever is the lesser. (See Figure 4b-8.)

§ 4b.247 *One-wheel landing.* The main landing gear on one side of the airplane center line shall contact the ground in the level attitude. (See Figure 4b-9.) The ground reaction on this side may be taken the same as those obtained in § 4b.245. The unbalanced external loads shall be rationally or conservatively reacted by inertia of the airplane.

§ 4b.248 *Lateral drift landing.* The airplane shall be in the level attitude with only the main wheels contacting the ground. (See Fig. 4b-10.) Side loads of 0.8 of the vertical reaction (on one

side) acting inward and 0.6 of the vertical reaction (on the other side) acting outward shall be combined with $\frac{1}{2}$ of the maximum vertical ground reactions obtained in the level landing conditions. (§ 4b.245.) These loads are applied at the ground contact point and may be assumed resisted by the inertia of the airplane. Drag loads may be assumed zero.

TAXIING CONDITIONS

§ 4b.251 *General.* The landing gear and airplane structure shall be investigated for the conditions stated in §§ 4b.252 to 4b.255, in which the airplane shall be assumed at the design take-off weight unless otherwise specified. No wing lift shall be considered.

[Amdt. 04b-5, 12 F. R. 3933]

§ 4b.252 *Take-off run.* The landing gear and airplane structure shall be designed for loads not less than those resulting from the condition specified in § 4b.164.

§ 4b.253 *Braked roll—(a) Tail wheel type:* The airplane shall be assumed in the level attitude with all load on the main wheels. The limit vertical load factor shall be 1.2 for the airplane at design landing weight and 1.0 for the airplane at design take-off weight. A drag reaction equal to the vertical reaction multiplied by a coefficient of friction of 0.8 shall be applied at the ground contact point in combination with the vertical ground reaction. (See Figure 4b-11.)

(b) *Nose wheel type.* The limit vertical load factor shall be 1.2 for the airplane at design landing weight and 1.0 for the airplane at design take-off weight. A drag reaction equal to 0.8 of the vertical reaction shall be combined with the vertical reaction and applied at the ground contact point of each wheel having brakes. Two airplane attitudes shall be considered. (See Figure 4b-13.)

(1) The airplane in the level attitude with all wheels contacting the ground, assuming zero pitching acceleration and the loads distributed between the main and nose gear by the principles of statics.

(2) The airplane in the level attitude with only the main gear contacting the ground and the pitching moment resisted by angular acceleration.

[Amdt. 04-0, 11 F. R. 71, as amended by Amdt. 04b-5, 12 F. R. 3933]

§ 4b.254 *Ground maneuvering—(a) Turning.* The airplane in the static position shall be assumed to execute a steady turn by nose gear steering or differential power such that the limit load factors applied at the center of gravity are 1.0 vertically and 0.5 laterally. The side ground reaction at each wheel shall be 0.5 of the vertical reaction. (See Figures 4b-12 and 4b-14.)

(b) *Pivoting.* The airplane shall be assumed to pivot about one main gear, the brakes on that gear being locked. The limit vertical load factor shall be 1.0 and the coefficient of friction 0.8. The airplane shall be assumed to be in static equilibrium, the loads being applied at the ground contact points. (See Figure 4b-15.)

Two conditions are used:

(1) $D_m = \mu V_m$ where V_m is vertical wheel reaction at instant wheels are up to speed and μ is coefficient of friction. μ may be assumed equal to 0.8. $12W$ —value necessary for balance.

(2) $D_m = 0.25 V_m$ where nW is determined by energy absorption requirements for landing.

FIGURE 4b-5.—LEVEL LANDING—TAIL WHEEL TYPE.

FIGURE 4b-6.—LEVEL LANDING—NOSE WHEEL TYPE.

FIGURE 4b-7.—BASIC DIMENSIONS AND TAIL DOWN LANDING—TAIL WHEEL TYPE.

contact point on the nose gear are those required for static equilibrium. The side load factor at the airplane center of gravity shall be assumed zero.

(d) *Tail wheel yawing.* A vertical ground reaction equal to the static load on the tail wheel, in combination with a side component of equal magnitude shall be assumed. When a swivel is provided, the tail wheel shall be assumed swiveled 90° to the airplane longitudinal axis with the resultant load passing through the axle. When a lock, steering device, or shimmy damper is provided, the tail wheel shall also be as-

(c) *Nose wheel yawing.* (1) A vertical load factor of 1.0 at the airplane center of gravity and a side component at the nose wheel ground contact equal to 0.8 of the vertical ground reaction at that point shall be assumed.

(2) The airplane shall be placed in static equilibrium with the loads resulting from the application of the brakes on one main gear. The vertical load factor at the center of gravity shall be 1.0. The forward acting load at the airplane center of gravity shall be $0.8 V_m$ where V_m is the vertical load on one main gear. The side and vertical loads at the ground

β = Angle for main gear and tail structure contacting ground except need not exceed stall angle.

FIGURE 4b-14.—GROUND TURNING—NOSE WHEEL TYPE.

V_n and V_m are static ground reactions for tail wheel type; the airplane is in the three point attitude with static landing gear reactions, pivoting about one main landing gear unit.

FIGURE 4b-15.—PIVOTING NOSE OR TAIL WHEEL TYPE.

sumed in the trailing position with the side load acting at the ground contact point.

§ 4b.255 *Unsymmetrical loads on dual wheel units.* In dual wheel units, 60% of the total ground reaction for the unit shall be applied to one wheel and 40% to the other. To provide for the case of one tire flat, either wheel shall be capable of withstanding 60% of the load which would be assigned to the unit in the specified conditions, except that the vertical ground reaction shall not be less than full static value.

WATER LOADS

§ 4b.261 *General.* The requirements set forth in §§ 4b.262-4b.288 shall apply to the entire airplane, but have particular reference to hull structure, wing, nacelles, and float supporting structure.

§ 4b.262 *Design weight.* The design weight used in the water landing conditions shall be not less than the design landing weight, except that local bottom pressure conditions shall be investigated at the design take-off weight.

BOAT SEAPLANES

§ 4b.266 *Local bottom pressures—(a) Maximum local pressure.* The maximum value of the limit local pressure shall be determined from the following equation:

$$P_{max} = 0.04 V_s^{1.5}$$

Where:

p = pressure, pounds per square inch
 V_s = stalling speed with flaps fully retracted at design take-off weight

(b) *Variation in local pressure.* The local pressures to be applied to the hull bottom shall vary in accordance with Figure 4b-16. No variation from keel to chine (beamwise) shall be assumed, except when the chine flare indicates the advisability of higher pressures at the chine.

(c) *Application of local pressure.* The local pressures determined in paragraphs (a) and (b) of this section shall be applied over a local area in such a manner as to cause the maximum local loads in the hull bottom structure.

§ 4b.267 *Distributed bottom pressures.* (a) For the purpose of designing frames, keels, and chine structure, the limit pressures obtained from § 4b.266, using a value of W not less than design landing weight, and Figure 4b-16 shall be reduced to $1/2$ the local values and simultaneously applied over the entire hull bottom. The loads so obtained shall be carried into the side-wall structure of the hull proper, but need not be transmitted in a fore-and-aft direction as shear and bending loads.

(b) *Unsymmetrical loading.* Each floor member or frame shall be designed for a load on one side of the hull center line equal to the most critical symmetrical loading, combined with a load on the other side of the hull center line equal to $1/2$ of the most critical symmetrical loading.

§ 4b.268 *Step loading condition—(a) Application of load.* The resultant water load shall be applied vertically in the plane of symmetry so as to pass through the center of gravity of the airplane.

(b) *Acceleration.* The limit acceleration shall be 4.0, unless a lower value is substantiated by suitable tests such as impact basin tests.

(c) *Hull shear and bending loads.* The hull shear and bending loads shall be computed from the inertia loads produced by the vertical water load. To avoid excessive local shear loads and bending moments near the point of water load application, the water load may be distributed over the hull bottom, using pressures not less than those specified in § 4b.267.

§ 4b.269 *Bow loading condition—(a) Application of load.* The resultant water load shall be applied in the plane of symmetry at a point $1/5$ of the distance from the bow to the step and shall be directed upward and rearward at an angle of 30° from the vertical.

(b) *Magnitude of load.* The magnitude of the limit resultant water load shall be determined from the following equation:

$$p_b = 1/2 n_s W_e$$

where:

p_b = the load in pounds.

n_s = the step landing load factor.

W_e = an effective weight which is assumed equal to $1/2$ the design landing weight of the airplane.

(c) *Hull shear and bending loads.* The hull shear and bending loads shall be determined by proper consideration of the inertia loads which resist the linear and angular accelerations involved. To avoid excessive local shear loads, the water reaction may be distributed over the hull bottom, using pressures not less than those specified in § 4b.267.

§ 4b.270 *Stern loading condition—(a) Application of load.* The resultant water load shall be applied vertically in the plane of symmetry and shall be distributed over the hull bottom from the second step forward with an intensity equal to the pressures specified in § 4b.267.

(b) *Magnitude of load.* The limit resultant load shall equal $3/4$ of the design landing weight of the airplane.

(c) *Hull shear and bending loads.* The hull shear and bending loads shall be determined by assuming the hull structure to be supported at the wing attachment fittings and neglecting internal inertia loads. This condition need not be applied to the fittings or to the portion of the hull ahead of the rear attachment fittings.

§ 4b.271 *Side loading condition—(a) Application of load.* The resultant water load shall be applied in a vertical plane through the center of gravity. The vertical component shall be assumed to act in the plane of symmetry and horizontal component at a point half way between the bottom of the keel and the load waterline at design landing weight (at rest).

(b) *Magnitude of load.* The limit vertical component of acceleration shall be 3.25 and the side component shall be equal to 15% of the vertical component.

(c) *Hull shear and bending loads.* The hull shear and bending loads shall be determined by proper consideration of the inertia loads or by introducing cou-

FIGURE 4b-16.—DISTRIBUTION OF LOCAL PRESSURES—BOAT SEAPLANES.

ples at the wing attachment points. To avoid excessive local shear loads, the water reaction may be distributed over the hull bottom, using pressures not less than those specified by § 4b.267.

FLOAT SEAPLANES

§ 4b.276 *Landing with inclined reactions.* The vertical component of the limit load factor shall be 4.0, unless a lower value is substantiated by suitable tests such as impact basin tests. The propeller axis (or equivalent reference line) shall be assumed to be horizontal and the resultant water reaction to be acting in the plane of symmetry and passing through the center of gravity of the airplane, but inclined so that its horizontal component is equal to $\frac{1}{4}$ of its vertical component. Inertia forces shall be assumed to act in a direction parallel to the water reaction.

§ 4b.277 *Landing with vertical reactions (float seaplanes).* The limit load factor shall be 4.0 acting vertically, unless a lower value is substantiated by suitable tests, such as impact basin tests. The propeller axis (or equivalent reference line) shall be assumed to be horizontal, and the resultant water reaction to be vertical and passing through the center of gravity of the airplane.

§ 4b.278 *Landing with side load (float seaplanes).* The vertical component of the limit load factor shall be 4.0. The propeller axis (or equivalent reference line) shall be assumed to be horizontal and the resultant water reaction shall be assumed to be in the vertical plane which passes through the center of gravity of the airplane and is perpendicular to the propeller axis. The vertical load shall be applied through the keel or keels of the float or floats and evenly divided between the floats when twin floats are used. A side load equal to one-fourth of the vertical load shall be applied along a line approximately halfway between the bottom of the keel and the level of the water line at rest. When twin floats are used, the entire side load specified shall be applied to the float on the side from which the water reaction originates.

§ 4b.279 *Seaplane float loads.* Each main float of a float seaplane shall be capable of carrying the following loads when supported at the attachment fittings as installed on the airplane.

(a) A limit load, acting upward, applied at the bow end of the float and of magnitude equal to that portion of the airplane weight normally supported by the particular float.

(b) A limit load acting upward at the stern of magnitude equal to 0.8 times that portion of the airplane weight normally supported by the particular float.

(c) A limit load, acting upward, applied at the step and of magnitude equal to 1.5 times that portion of the airplane weight normally supported by the particular float.

§ 4b.280 *Seaplane float bottom loads.* Main seaplane float bottoms shall be designed to withstand the following loads:

(a) A limit bottom pressure of at least the value specified in § 4b.266, applied over that portion of the bottom lying

between the first step and a section at 25% of the distance from the step to the bow.

(b) A limit bottom pressure of at least one-half the value specified in paragraph (a) of this section applied over that portion of the bottom lying between the section at 25% of the distance from the step to the bow and a section at 75% of the distance from the step to the bow.

(c) A limit bottom pressure of at least 0.3 of the values specified in paragraph (a) of this section, applied over that portion of the bottom aft of the step (aft of main step if more than one step is used).

WING-TIP FLOAT AND SEA WING LOADS

§ 4b.286 *Wing-tip float loads.* Wing-tip floats and their attachment, including the wing structure, shall be analyzed for each of the following conditions:

(a) A limit load acting vertically up at the completely submerged center of buoyancy and equal to three times the completely submerged displacement.

(b) A limit load inclined upward at 45° to the rear and acting through the completely submerged center of buoyancy and equal to three times the completely submerged displacement.

(c) A limit load acting parallel to the water surface (laterally) applied at the center of area of the side view and equal to 1.5 times the completely submerged displacement.

§ 4b.287 *Primary wing structure.* The primary wing structure shall incorporate sufficient extra strength to insure that failure of wing-tip float attachment members occurs before the wing structure is damaged.

§ 4b.288 *Sea wing loads.* Sea wing design loads shall be based on suitable test data.

EMERGENCY LANDING CONDITIONS

§ 4b.291 *General.* The following requirements deal with emergency conditions of landing on land or water in which the safety of the occupants shall be considered, although it is accepted that parts of the airplane may be damaged.

(a) The structure shall be designed to give every reasonable probability that all the occupants, if they make proper use of the seats, belts, and other provisions made in the design (see §§ 4b.441-4b.456) will escape serious injury in the event of a minor crash landing (with wheels up if the airplane is equipped with retractable landing gear) in which the occupants experience the following ultimate inertia forces relative to the surrounding structure.

Forward.....	0 to 6.0 g
Sideward.....	0 to 1.5 g
Vertical.....	0 to 4.5 g (down) 0 to 2.0 g (up)

(b) A lesser value of the downward inertia force may be used if it is shown that the airplane structure could absorb the landing shock corresponding to the design landing weight and an ultimate descent velocity of 5 feet per second without exceeding the value chosen. The specified inertia forces shall also be applied to all items of mass which would be liable to injure the passengers or crew if they came adrift under such condi-

tions, and the supporting structure shall be designed to restrain these items.

[Amdt. 04-0, 11 F. R. 71, as amended by Amdt. 04b-5, 12 F. R. 3933]

§ 4b.292 *Ditching provisions.* (a) At the request of the applicant, type certification may include certification that adequate provision has been made for emergency landings during overwater flights. In order that landplanes may qualify for such a certification, satisfactory evidence must be submitted that all practicable measures compatible with the general characteristics of the type have been taken to minimize the chance of any behavior of the airplane, in an emergency landing on water, which would be likely to cause immediate injury to the occupants or to make it impossible for them to escape from the airplane. (Airplanes that are to receive this special certification must also comply with the terms of § 4b.431).

(b) In demonstrating compliance with this requirement, the probable behavior of the airplane in a water landing shall be investigated by model tests or comparison with airplanes of similar configuration for which the ditching characteristics are known. In making such tests or comparisons proper consideration shall be given to scoops, flaps, projections, and all other factors likely to affect the hydrodynamic characteristics of the actual airplane. External doors and windows shall be designed to withstand the probable maximum local pressures unless the effects of the collapse of such parts are taken into account in the model tests or airplane comparison.

SUBPART D—DESIGN AND CONSTRUCTION GENERAL

§ 4b.301 *Minimum tests.* The airplane shall not incorporate design features or details which experience has shown to be hazardous or unreliable. The suitability of all questionable design details or parts shall be established by tests. Minimum tests required to prove the strength and proper functioning of particular parts are specified.

§ 4b.302 *Materials.* The suitability and durability of all materials used in the airplane structure shall be established on the basis of experience or tests. All materials used in the airplane structure shall conform to approved specifications which will insure their having the strength and other properties assumed in the design data.

§ 4b.302-1 *Technical Standard Order TSO-C14: "Aircraft Fabric, 'Intermediate' Grade, External Covering Material" (CAA rules which apply to § 4b.302)—(a) Introduction.* (1) Aircraft fabric is in the class of aircraft components which the Administrator of Civil Aeronautics is authorized to approve in accordance with Parts 3, 4a and 4b of this subchapter.

(2) This Technical Standard Order is intended to serve as a criterion by which the product manufacturer can obtain Civil Aeronautics Administration approval of his aircraft fabric.

(3) In the establishment of this Technical Standard Order, consideration has been given to existing Government and industry standards for aircraft fabric for

the purpose of adopting the performance requirements of one of the recognized aeronautical standards as the minimum safety requirements for "intermediate" grade fabric which is intended for use as external covering material on civil aircraft or components thereof. The specifications of the Society of Automotive Engineers for "intermediate" grade fabric contains such requirements.

(b) *Directive.*

(1) *Provision.* Pursuant to §§ 3.31, 3.320, 4a.31, 4a.252, 4a.338, 4b.41, 4b.302, and 4b.332 of this subchapter, which authorize the Administrator to approve aircraft material, the performance requirements for "intermediate" grade fabric as set forth in section 5 of SAE Specification AMS 3804, Cloth: Airplane, Cotton, Mercerized, dated January 1, 1946,¹ stated below, are hereby established as the minimum safety requirements for "intermediate" grade fabric which is intended for external use on civil aircraft:

1. *Acknowledgment.* A vendor shall mention this specification number in all quotations and when acknowledging purchase orders.

2. *Application.* The cloth shall be suitable for covering aircraft surfaces such as wings, fuselage, ailerons, and elevators.

3. *Material.* The cloth shall be woven from 1- or 2-ply, combed cotton yarn.

4. *Quality.* (a) The cotton fibers shall be evenly spun into yarns of proper and uniform yarn count, twist, and diameter to produce the texture and weight required.

(b) The yarn shall be reasonably free from nap breaks, broken ends, uneven threads and knots.

(c) Yarns shall be closely woven into fabric uniform in body and appearance, and which shall be reasonably free from striations due to variable weaving operations. Cloth shall be uniformly finished in accordance with the best practice for high-grade airplane cloth.

5. *Requirements.* (a) The cloth shall be piece mercerized, or the yarn may be mercerized under tension.

(b) The weave shall be plain (one up and one down).

(c) The number of threads shall be not more than 94 and not less than 80 per inch in either the warp or the fill.

(d) The selvage edges shall be flat woven with no greater tension than that of the body of the cloth.

(e) The breaking strength shall be not less than 65 pounds per inch of width in either the warp or fill as determined by the ravelled-strip method.

(f) The elongation shall be not greater than 13% in the warp and not greater than 11% in the fill when 57 pounds tension is applied during the ravelled-strip test.

(g) The tearing strength shall be not less than 4 pounds in either the warp or fill as determined by the trapezoid method.

(h) The weight of the finished cloth shall not exceed 4 ounces per square yard.

(i) The cloth shall contain not more than 2.5% total sizing, finishing and other non-fibrous materials and should be chemically neutral. A desizing operation may be performed if necessary to reduce the sizing content to the 2.5% maximum value specified.

(j) Finishing shall consist of washing, framing and calendering. The calendering shall be sufficient to lay any nap present and shall provide a smooth, even surface. Nap may be removed by singeing.

6. *Tests.* All tests shall be made in accordance with ASTM D39-39 except as follows: The test for total sizing, finishing and other non-fibrous materials shall be made in accordance with ASTM D629-42T, using equation 3 for calculation.

7. *Tolerances.* Unless otherwise specified on the drawing or purchase order, the following tolerances apply:

Width (inches):	Tolerance (inches)
36-----	± 1/2
42-----	± 3/4
60-----	± 1
69-----	± 1
90-----	± 1 1/2

8. *Length of cut.* The length of a single cut shall be not less than 40 yards except that 10% of the total yardage of one width under any contract or order may be, in short lengths of from 10 to 25 yards and 10% may be from 25 to 40 yards. However, short lengths shall be rolled together and the roll properly labeled to indicate that it is composed of short lengths.

9. *Length of rolls.* The cloth shall be furnished on rolls containing the following lengths:

Width (inches):	Roll length (yards)
36 and 42-----	500 to 600
60 and 69-----	250 to 300
90-----	175 to 200

10. *Reports.* Unless otherwise specified, the vendor shall furnish for each shipment three copies of a notarized report stating that the cloth conforms to this specification. This report shall include the purchase order number, material specification number and quantity.

11. *Identification.* The cloth shall incorporate a continuous marking to show the manufacturer's name or trade mark and AMS 3804. This marking may be stamped along the selvage.

12. *Packaging.* (a) Packaging shall be accomplished in such a manner as to insure that the cloth, during shipment or storage, will be protected against exposure to moisture or weathering, or harmful agents of any kind.

(b) Each package shall be permanently and legibly marked to give the following information:

Cloth: airplane, cotton, mercerized 65 lbs.
Breaking Strength AMS 3804
Yardage-----
Width-----
Date of manufacture-----
Order number-----
Manufacturer's name-----

13. *Approval.* A vendor shall not supply cloth to this specification until samples are approved by the purchaser and, after approval, the materials and/or methods of manufacture shall not be changed without written permission from the purchaser. Results of tests on incoming shipments shall be essentially equal to those on the approved samples.

14. *Rejections.* Cloth not conforming to this specification or to authorized modifications shall be subject to rejection. Unless otherwise stipulated, rejected cloth will be returned to vendor at vendor's expense, unless purchaser receives, within three weeks of notification of rejection, other instructions for disposition.

NOTE: Similar specification. ANC-121 is listed for information only and shall not be construed as an acceptable alternate unless all requirements of this AMS are met.

(2) *Application.* Fabric complying with the specifications appearing in this order is approved for all aircraft with wing loadings of less than 9 pounds per square foot and placard never-exceed

speeds of less than 160 miles per hour. Fabric already approved by the Administrator may continue to be installed on aircraft:

(i) For which an application for original type certificate is made prior to the effective date of this order.

(ii) The prototype of which is flown within 1 year after the effective date of this order, and

(iii) The prototype of which is not flown within 1 year after the effective date of this order if due to causes beyond the applicant's control.

(c) *Specific instructions.*

(1) *Marking.* In addition to the identification information required in the referenced specification, the Technical Standard Order designation "CAA-TSO-C14" shall be marked continuously along the selvage edge of the cloth, except that for the purposes of this order, inclusion of the AMS number 3804 is not required. This will identify the fabric as meeting the requirements of this order in accordance with the manufacturer's statement of conformance outlined below. This identification will be accepted by the Civil Aeronautics Administration as evidence that the established minimum safety requirements for aircraft fabric have been met.

(2) *Data requirements.* None.

(3) *Effective date.* After September 1, 1948, specifications contained in this Technical Standard Order will constitute the basis for Civil Aeronautics Administration approval of "intermediate" grade fabric for use on certificated aircraft.

(4) *Deviations.* Requests for deviation from, or waiver of, the requirements of this order, which affect the basic airworthiness of the component, should be submitted for approval by the Director, Aircraft Service, Office of Aviation Safety, Civil Aeronautics Administration. These requests should be addressed to the nearest regional office of the Civil Aeronautics Administration, Attn: Superintendent, Aircraft Branch.

(5) *Conformance.* (i) The manufacturer shall furnish to the Civil Aeronautics Administration, Aircraft Service, Attn: A-298, Washington 25, D. C., a written statement of conformance signed by a responsible official of his company, setting forth that the "intermediate" grade fabric to be manufactured by him meets the minimum safety requirements established in this order. Immediately thereafter, distribution of the aircraft fabric conforming to the terms of this order may be started and continued.

(ii) The prescribed identification on the aircraft fabric does not relieve the aircraft manufacturer or owner of responsibility for the proper application of the aircraft fabric on his aircraft, nor waive any of the requirements concerning type certification of the aircraft in accordance with existing Civil Air Regulations.

(iii) If complaints of nonconformance with the requirements of this order are brought to the attention of the Civil Aeronautics Administration, and investigation indicates that such complaints are justified, the Administrator will take appropriate action to restrict the use of the product involved.

¹ Copies may be obtained from the Society of Automotive Engineers, 29 West 39th St., New York, N. Y.

(iv) Copies of this Technical Standard Order and other Technical Standard Orders may be obtained from the Civil Aeronautics Administration, Aviation Information Staff, Washington 25, D. C. [13 F. R. 7726]

§ 4b.302-2 *Technical Standard Order TSO-C15: "Aircraft Fabric, Grade 'A,' External Covering Material"* (CAA rules which apply to § 4b.302)—(a) *Introduction.* (1) Aircraft fabric is in the class of aircraft components which the Administrator of Civil Aeronautics is authorized to approve in accordance with Parts 3, 4a and 4b of this subchapter.

(2) This Technical Standard Order is intended to serve as a criterion by which the product manufacturer can obtain Civil Aeronautics Administration approval of his aircraft fabric.

(3) In the establishment of this Technical Standard Order, consideration has been given to existing Government and industry standards for aircraft fabric for the purpose of adopting the performance requirements of one of the recognized aeronautical standards as the minimum safety requirements for Grade "A" fabric which is intended for use as external covering material on civil aircraft or components thereof. The specifications of the Society of Automotive Engineers for Grade "A" fabric contains such requirements.

(b) *Directive.*

(1) *Provision.* Pursuant to §§ 3.31, 3.320, 4a.31, 4a.252, 4a.338, 4b.41, 4b.302, and 4b.332 of this subchapter, which authorize the Administrator to approve aircraft material, the performance requirements for Grade "A" fabric as set forth in section 5 of SAE Specification AMS 3806, Cloth; Airplane, Cotton, Mercerized, dated January 1, 1946,¹ stated below, are hereby established as the minimum safety requirements for Grade "A" fabric which is intended for external use on civil aircraft.

1. *Acknowledgment.* A vendor shall mention this specification number in all quotations and when acknowledging purchase orders.

2. *Application.* The cloth shall be suitable for covering aircraft surfaces such as wings, fuselage, ailerons, and elevators.

3. *Material.* The cloth shall be woven from 2-ply, combed cotton yarn.

4. *Quality.* (a) The cotton fibers shall be evenly spun into yarns of proper and uniform yard count, twist, and diameter to produce the texture and weight required.

(b) The yarn shall be reasonably free from nap breaks, broken ends, uneven threads and knots.

(c) Yarns shall be closely woven into fabric uniform in body and appearance, and which shall be reasonably free from striations due to variable weaving operations. Cloth shall be uniformly finished in accordance with the best practice for high-grade airplane cloth.

5. *Requirements.* (a) The cloth shall be piece mercerized, or the yarn may be mercerized under tension.

(b) The weave shall be plain (one up and one down).

(c) The number of threads shall be not more than 84 and not less than 80 per inch in either the warp or the fill.

¹ Copies may be obtained from the Society of Automotive Engineers, 29 West 89th St., New York, N. Y.

(d) The selvage edges shall be flat woven with no greater tension than that of the body of the cloth.

(e) The breaking strength shall be not less than 80 pounds per inch of width in either the warp or fill as determined by the ravelled-strip method.

(f) The elongation shall be not greater than 13% in the warp and not greater than 11% in the fill when 70 pounds tension is applied during the ravelled-strip test.

(g) The tearing strength shall be not less than 5 pounds in either the warp or fill as determined by the trapezoid method.

(h) The weight of the finished cloth shall not exceed 4.0 ounces per square yard for 36 and 42 inch widths and 4.5 ounces per square yard for 60 inches and over.

(i) The cloth shall contain not more than 2.5% total sizing, finishing and other non-fibrous materials and should be chemically neutral. A desizing operation may be performed if necessary to reduce the sizing content to the 2.5% maximum value specified.

(j) Finishing shall consist of washing, framing and calendaring. The calendaring shall be sufficient to lay any nap present and shall provide a smooth, even surface. Nap may be removed by singeing.

6. *Tests.* All tests shall be made in accordance with ASTM D39-39 except as follows: The test for total sizing, finishing and other non-fibrous materials shall be made in accordance with ASTM D629-42T, using equation 3 for calculation.

7. *Tolerances.* Unless otherwise specified on the drawing or purchase order, the following tolerances apply:

Width (inches):	Tolerance (inches)
36-----	±½
42-----	±½
60-----	±1
69-----	±1
90-----	±1½

8. *Length of cut.* The length of a single cut shall be not less than 40 yards except that 10% of the total yardage of one width under any contract or order may be in short lengths of from 10 to 25 yards and 10% may be from 25 to 40 yards. However, short lengths shall be rolled together and the roll properly labeled to indicate that it is composed of short lengths.

9. *Length of roll.* The cloth shall be furnished on rolls containing the following lengths:

Width (inches):	Roll length (yards)
36 and 42-----	500 to 600
60 and 69-----	250 to 300
90-----	175 to 200

10. *Reports.* Unless otherwise specified, the vendor shall furnish for each shipment three copies of a notarized report stating that the cloth conforms to this specification. This report shall include the purchase order number, material specification number and quantity.

11. *Identification.* The cloth shall incorporate a continuous marking to show the manufacturer's name or trade-mark and AMS 3806. This marking may be stamped along the selvage.

12. *Packaging.* (a) Packaging shall be accomplished in such a manner as to insure that the cloth, during shipment or storage, will be protected against exposure to moisture or weathering, or harmful agents of any kind.

(b) Each package shall be permanently and legibly marked to give the following information:

Cloth: airplane, cotton, mercerized, 80 lbs.
 Breaking Strength AMS 3806
 Yardage -----
 Width -----
 Date of Manufacture -----
 Order number -----
 Manufacturer's name -----

13. *Approval.* A vendor shall not supply cloth to this specification until samples are approved by the purchaser and, after approval, the materials and/or methods of manufacture shall not be changed without written permission from the purchaser. Results of tests on incoming shipments shall be essentially equal to those on the approved samples.

14. *Rejections.* Cloth not conforming to this specification or to authorized modifications shall be subject to rejection. Unless otherwise stipulated, rejected cloth will be returned to vendor at vendor's expense, unless purchaser receives, within three weeks of notification of rejection, other instructions for disposition.

NOTE: Similar specification. ANC-121 is listed for information only and shall not be construed as an acceptable alternate unless all requirements of this AMS are met.

(2) *Application.* Fabric complying with the specifications appearing in this order is approved for all aircraft with wing loadings greater than 9 pounds per square foot and placard never-exceed speeds greater than 160 miles per hour. Fabric already approved by the Administrator may continue to be installed on aircraft:

(i) For which an application for original type certificate is made prior to the effective date of this order,

(ii) The prototype of which is flown within 1 year after the effective date of this order, and

(iii) The prototype of which is not flown within 1 year after the effective date of this order if due to causes beyond the applicant's control.

(c) *Specific instructions.*

(1) *Marking.* In addition to the identification information required in the referenced specification, the Technical Standard Order designation "CAA-TSO-C15" shall be marked continuously along the selvage edge of the cloth, except that for the purposes of this order, inclusion of the AMS number 3806 is not required. This will identify the fabric as meeting the requirements of this order in accordance with the manufacturer's statement of conformance outlined below. This identification will be accepted by the Civil Aeronautics Administration as evidence that the established minimum safety requirements for aircraft fabric have been met.

(2) *Data requirements.* None.

(3) *Effective date.* After September 1, 1948, specifications contained in this Technical Standard Order will constitute the basis for Civil Aeronautics Administration approval of Grade "A" fabric for use on certificated aircraft.

(4) *Deviations.* Requests for deviation from, or waiver of, the requirements of this order, which affect the basic airworthiness of the component, should be submitted for approval by the Director, Aircraft Service, Office of Aviation Safety, Civil Aeronautics Administration. These requests should be addressed to the nearest regional office of the Civil Aeronautics Administration, Attn: Superintendent, Aircraft Branch.

(5) *Conformance.* (i) The manufacturer shall furnish to the Civil Aeronautics Administration, Aircraft Service, Attn: A-298, Washington 25, D. C., a written statement of conformance signed by a responsible official of his company,

setting forth that the Grade "A" aircraft fabric to be manufactured by him meets the minimum safety requirements established in this order. Immediately thereafter, distribution of the aircraft fabric conforming to the terms of this order may be started and continued.

(ii) The prescribed identification on the aircraft fabric does not relieve the aircraft manufacturer or owner of responsibility for the proper application of the aircraft fabric on his aircraft, nor waive any of the requirements concerning type certification of the aircraft in accordance with existing Civil Air Regulations.

(iii) If complaints of nonconformance with the requirements of this order are brought to the attention of the Civil Aeronautics Administration, and investigation indicates that such complaints are justified, the Administrator will take appropriate action to restrict the use of the product involved.

(iv) Copies of this Technical Standard Order and other Technical Standard Orders may be obtained from the Civil Aeronautics Administration, Aviation Information Staff, Washington 25, D. C.

[13 F. R. 7727]

§ 4b.303 *Fabrication methods.* The methods of fabrication employed in constructing the airplane structure shall be such as to produce a uniformly sound structure. When a fabrication process such as gluing, spot welding, or heat treating requires close control to attain this objective, the process shall be performed in accordance with an approved process specification.

§ 4b.304 *Standard fastenings.* All bolts, pins, screws, and rivets used in the structure shall be of an approved type. The use of an approved locking device or method is required for all such bolts, pins, and screws. Self-locking nuts shall not be used on bolts which are subject to rotation in operation.

§ 4b.305 *Protection.* All members of the structure shall be suitably protected against deterioration or loss of strength in service due to weathering, corrosion, abrasion, or other causes. In seaplanes, special precaution shall be taken against corrosion from salt water, particularly where parts made from different metals are in close proximity. Adequate provisions for ventilation and drainage shall be made.

§ 4b.306 *Inspection provisions.* Adequate means shall be provided to permit the close examination of such parts of the airplane as require periodic inspection, adjustments for proper alignment and functioning, and lubrication of moving parts.

STRUCTURAL PARTS

§ 4b.311 *Material strength properties and design values.* Material strength properties shall be based on a sufficient number of tests of material conforming to specifications to establish design values on a statistical basis. The design values shall be so chosen that the probability of any structure being understrength because of material variations is extremely

remote. ANC-5¹ values and ANC-18¹ shall be used unless shown to be inapplicable in a particular case.

§ 4b.312 *Special factors.* Where there may be uncertainty concerning the actual strength of particular parts of the structure, or where the strength is likely to deteriorate in service prior to normal replacement, increased factors of safety shall be provided to insure that the reliability of such parts is not less than the rest of the structure as specified in §§ 4b.313-4b.316.

§ 4b.313 *Variability factor.* For parts whose strength is subject to appreciable variability due to uncertainties in manufacturing processes and inspection methods, the factor of safety shall be increased sufficiently to make the probability of any part being understrength from this cause extremely remote. Minimum variability factors (only the highest pertinent variability factor need be considered) are as follows:

(a) *Castings.* (1) Where visual inspection only is to be employed, the variability factor shall be 2.0.

(2) The variability factor may be reduced to 1.25 for ultimate loads and 1.15 for limit loads when at least three sample castings are tested to show compliance with these factors, and all sample and production castings are visually and radiographically inspected in accordance with an approved inspection specification.

(3) Other inspection procedures and variability factors may be used if approved by the Administrator.

§ 4b.314 *Bearing factors.* (a) The factor of safety in bearing at bolted or pinned joints shall be suitably increased to provide for the following conditions (values in ANC-5 are acceptable):

(1) Relative motion in operation. (Control surface and system joints are covered in §§ 4b.341-4b.343 and 4b.351-4b.368.)

(2) Joints with clearance (free fit) subject to pounding or vibration.

(b) Bearing factors need not be applied when covered by other special factors.

§ 4b.315 *Fitting factor.* Fittings are defined as parts such as end terminals used to join one structural member to another. A multiplying factor of safety of at least 1.15 shall be used in the analysis of all fittings whose strength is not proven by limit and ultimate load tests in which the actual stress conditions are simulated in the fitting and the surrounding structure. This factor applies to all portions of the fitting, the means of attachment, and bearing on the members joined. In the case of integral fittings, the part shall be treated as a fitting up to the point where the section properties become typical of the member. The fitting factor need not be applied where a

¹ ANC-5, "Strength of Aircraft Elements" and ANC-18, "Design of Wood Aircraft Structures," are published by the Army-Navy-Civil Committee on Aircraft Design Criteria and may be obtained from the Government Printing Office, Washington 25, D. C., for \$0.35 and \$0.25, respectively.

type of joint design based on comprehensive test data is used. The following are examples: Continuous joints in metal plating, welded joints, and scarf joints in wood, all made in accordance with approved practices.

§ 4b.316 *Fatigue strength.* The structure shall be designed in so far as practicable, to avoid points of stress concentration where variable stresses above the fatigue limit are likely to occur in normal service.

FLUTTER, VIBRATION, AND STIFFNESS

§ 4b.321 *Flutter and vibration prevention measures.* (a) Wings, tail surfaces, control surfaces, control systems, and other structural parts shall be free from flutter and all dangerous vibration, including that resulting from gust impulses, for all conditions of operation within the limit $V-n$ envelope (see § 4b.171 for required flight demonstration). In addition to this flight demonstration, satisfactory analytical and/or experimental evidence shall be submitted to show that dangerous flutter conditions would not develop at any speed up to $1.2 V_a$ chosen in accordance with § 4b.189 except that the speed need not exceed the terminal velocity in a 30° dive.

(b) In showing compliance with this section:

(1) The natural frequencies of all main structural components, control surfaces and systems shall be determined by vibration tests or other satisfactory methods, and shall be shown to be within the range of values satisfactory for the prevention of flutter.

(2) The mass balance of movable control surfaces shall be shown to be such as to preclude flutter. If concentrated balance weights are used to balance control surfaces, their location and the stiffness of their supports shall be shown adequate to render them effective.

(3) Control surface tabs not equipped with a rugged irreversible actuating mechanism, as specified in § 4b.353, shall be properly mass balanced and shown to be free from flutter tendencies by a rational flutter analysis or equivalent testing.

§ 4b.322 *Stiffness.* Wings and tail surfaces shall be shown to be free from aero-elastic divergence, and control surfaces to be free from reversal of effect, at all speeds up to $1.2 V_a$ chosen in accordance with § 4b.189, except that the speed need not exceed the terminal velocity in a 30° dive. In showing compliance with this section, the torsional rigidity of wings and tail surfaces shall be determined by tests or other acceptable methods.

WINGS

§ 4b.331 *External bracing.* When wires are used for external lift bracing, they shall be double unless the design provides for a lift-wire-cut condition. Rigging loads shall be taken into account in a rational or conservative manner. The end connections of brace wires shall be such as to minimize restraint against bending or vibration. When brace struts of large fineness ratio are used, the aerodynamic forces on such struts shall be taken into account.

§ 4b.332 *Covering.* Strength tests of fabric covering are required unless approved grades of cloth, methods of support, attachment and finishing are employed. Special tests may be required when it appears necessary to account for the effects of unusually high design air speeds, slipstream velocities, or other unusual conditions.

§ 4b.332-1 *Aircraft fabric (CAA rules which apply to § 4b.332).* See §§ 4b.302-1 and 4b.302-2.

[13 F. R. 7728]

CONTROL SURFACES (FIXED AND MOVABLE)

§ 4b.341 *Proof of strength.* Limit load tests are required to prove compliance with limit load requirements. Control surface tests shall include the horn or fitting to which the control system is attached. Analysis or individual load tests shall be conducted to demonstrate compliance with the multiplying factor of safety requirements for control surface hinges. Rigging loads due to wire bracing shall be taken into account in a rational or conservative manner. The end connections of brace wires shall be such as to minimize restraint against bending or vibration.

§ 4b.342 *Installation.* Movable tail surfaces shall be so installed that there is no interference between the surfaces of their bracing when each is held in its extreme position and all others are operated through their full angular movement. When an adjustable stabilizer is used, stops shall be provided which will limit its travel, in the event of failure of the adjusting mechanism, to a range equal to the maximum required to trim the airplane in accordance with § 4b.136.

§ 4b.343 *Hinges.* Control surface hinges, excepting ball and roller bearings, shall incorporate a multiplying factor of safety of not less than 6.67 with respect to the ultimate bearing strength of the softest material used as a bearing. For hinges incorporating ball or roller bearings, the approved rating of the bearing shall not be exceeded. Hinges shall provide sufficient strength and rigidity for loads parallel to the hinge line.

CONTROL SYSTEMS

§ 4b.351 *General.* All controls shall operate with sufficient ease, smoothness, and positiveness to permit the proper performance of their function and shall be so arranged and identified as to provide satisfactory convenience in operation and prevent possibility of confusion and subsequent inadvertent operation.

§ 4b.352 *Primary flight controls.* Primary flight controls are defined as those used by the pilot for the immediate control of the pitching, rolling, and yawing of the airplane. Two-control airplanes shall be capable of continuing safely in flight and landing in spite of the failure of any one connecting element in the primary directional-lateral flight control system.

§ 4b.353 *Trimming controls.* The trimming controls shall be conveniently located and each shall operate in the plane and with the sense of the motion of the airplane which its operation is in-

tended to provide, as specified in § 4b.423. Proper precautions shall be taken against the possibility of inadvertent or abrupt tab operation. Means shall be provided, adjacent to the control to indicate to the pilot the direction of the control movement in relation to the airplane motion and the positions of the trim device with respect to the range of adjustment. Trimming devices shall be capable of continued normal operation in spite of the failure of any one connecting or transmitting element in the primary flight control system. Tab controls shall be irreversible unless the tab is properly balanced and investigated for flutter. Irreversible tab systems shall provide adequate rigidity and reliability in the portion of the system from the tab to the attachment of the irreversible unit to the airplane structure.

§ 4b.354 *Wing flap controls.* The wing flap control shall provide means for bringing the flaps from any position within the operating range to any one of the take-off, en route, approach, and landing positions specified in §§ 4b.91-4b.114. The control shall operate in such a manner as to permit the flight crew to place the flap in any of these positions readily and surely and to maintain these positions thereafter without further attention on the part of the crew. The flap control shall operate in the directions specified in § 4b.423 and shall be so located and designed as to render improbable its inadvertent operation. (See Fig. 4b-17.) The rate of motion of the flap in response to the operation of the control shall be such as to permit compliance with the requirements of § 4b.127 (c) and (d). The control shall be so designed as to be capable of retracting the flaps from the fully extended position during steady flight drawing maximum continuous power at all speeds from V_{st} to V_f plus 10 miles per hour. Means shall be provided to indicate the flap position to the pilot and the indicator shall show the take-off, en route, approach, and landing positions. If any extension of the flaps beyond the landing position is possible, the flap control shall be clearly marked to identify such range of extension. Adequate instructions for the proper operation of the wing flaps shall be included in the airplane operating manual required by §§ 4b.911-4b.926.

§ 4b.355 *Flap interconnection.* The motion of flaps on opposite sides of the plane of symmetry shall be synchronized by a mechanical interconnection unless the airplane is demonstrated to have safe flight characteristics while the flaps are retracted on one side and extended on the other. Where an interconnection is used, it shall be designed to account for the unsymmetrical loads resulting from flight with the engines on one side of the plane of symmetry inoperative and the remaining engines at take-off power. For single-engined airplanes, it may be assumed that 100% of the critical air load acts on one side and 70% on the other.

§ 4b.356 *Stops.* All control systems shall be provided with stops which positively limit the range of motion of the control surfaces. Stops shall be so lo-

cated in the system that wear, slackness, or take-up adjustments will not appreciably affect the range of surface travel. Stops shall be capable of withstanding the loads corresponding to the design conditions for the control system.

§ 4b.357 *Control system locks.* (a) When a device is provided for locking a control surface while the airplane is on the ground or water:

(1) The locking device shall be so installed as to provide unmistakable warning to the pilot when it is engaged,

(2) Means shall be provided to preclude the possibility of the lock becoming engaged during flight.

(b) Such locks shall be designed for the ground gust conditions of § 4b.233.

§ 4b.358 *Proof of strength.* Tests are required to prove compliance with limit load requirements. The direction of test loads shall be such as to produce the most severe loading of the control system structure. The tests shall include all fittings, pulleys, and brackets used to attach the control system to the primary structure. Analyses or individual load tests shall be conducted to demonstrate compliance with the multiplying factor of safety requirements specified for control system joints subjected to angular motion.

§ 4b.359 *Operation test.* An operation test shall be conducted by operating the controls from the pilot's compartment with the entire system so loaded as to correspond to 80% of the limit load specified for the control system in question. In this test there shall be no jamming, excessive friction, or excessive deflection.

CONTROL SYSTEM DETAILS

§ 4b.366 *General.* All control systems and operating devices shall be so designed and installed as to prevent jamming, chafing, or interference from cargo, passengers, or loose objects as a result of inadequate clearances. Special precautions shall be provided in the cockpit to prevent the entry of foreign objects into places where they might jam the controls. Provisions shall be made to prevent the slapping of cables or tubes against parts of the airplane.

§ 4b.367 *Cable systems.* Cables, cable fittings, turnbuckles, splices, and pulleys shall be in accordance with approved specifications. Cables smaller than $\frac{1}{8}$ -inch diameter shall not be used in the primary control system. The design of cable systems shall be such that there will not be a hazardous change in cable tension throughout the range of travel under operating conditions and temperature variations. Pulley types and sizes shall correspond to the cables with which they are used, as specified on the pulley specification. All pulleys shall be provided with satisfactory guards which shall be closely fitted to prevent the cables becoming misplaced or fouled even when slack. The pulleys shall lie in the plane passing through the cable within such limits that the cable does not rub against the pulley flange. Fairleads shall be so installed that they are not required to cause a change in cable

direction of more than 3°. Clevis pins (excluding those not subject to load or motion) retained only by cotter pins shall not be employed in the control system. Turnbuckles shall be attached to parts having angular motion in such a manner as to prevent positively any binding throughout the range of travel. Provisions for visual inspection shall be made at fairleads, pulleys, terminals, and turnbuckles.

§ 4b.368 *Joints*. Control system joints subjected to angular motion in push-pull systems, excepting ball and roller bearing systems, shall incorporate a multiplying factor of safety of not less than 3.33 with respect to the ultimate bearing strength of the softest material used as a bearing. This factor may be reduced to 2.0 for such joints in cable control systems. For ball or roller bearings the approved rating of the bearings shall not be exceeded.

LANDING GEAR

SHOCK ABSORBERS

§ 4b.371 *Tests*. Main, nose, and tail wheel units shall incorporate shock absorbing elements which shall be substantiated by the tests specified in §§ 4b.372-4b.375. In addition, the shock absorbing ability of the landing gear in taxiing must be demonstrated in the operational tests of § 4b.164.

§ 4b.372 *Shock absorption tests*. (a) It shall be demonstrated by energy absorption tests that the limit load factors selected for design in accordance with § 4b.243 for take-off and landing weights respectively would not be exceeded under the critical landing conditions specified in that section.

(b) In addition, a reserve of energy absorption shall be demonstrated by a test simulating an airplane descent velocity of 12 feet per second at design landing weight, assuming wing lift not greater than the airplane weight acting during the landing impact. In this test the landing gear shall not fail.

§ 4b.373 *Limit drop tests*. (a) If compliance with the specified limit landing conditions of § 4b.372 (a) is demonstrated by free drop tests, these shall be conducted on the complete airplane, or on units consisting of wheel, tire, and shock absorber in their proper relation, from free drop heights not less than the following:

(1) 18.7 inches for the design landing weight conditions.

(2) 6.7 inches for the design take-off weight conditions.

(b) To simulate wing lift in free drop tests the landing gear shall be dropped with an effective mass equal to:

$$W_e = \frac{Wh + (1-L)d}{h+d}$$

where:

W_e = the effective weight to be used in the drop test.

h = specified height of drop in inches.

d = deflection under impact of the tire (at the approved inflation pressure) plus the vertical component of the axle travel relative to the drop mass. The value of d used in the computation of W_e shall not exceed the value actually obtained in the drop test.

$W = W_M$ for main units, equal to the static weight on the particular unit with the airplane in the level attitude (with the nose wheel clear, in the case of nose wheel type airplanes).

$W = W_T$ for tail gear units, equal to the static weight on the tail unit with the airplane in the tail down attitude.

$W = W_N$ for nose wheel units, equal to the static reaction which would exist at the nose wheel, assuming the mass of the airplane acting at the center of gravity and exerting a force of 1.0 g downward and 0.25 g forward.

L = the ratio of the assumed wing lift to the airplane weight, not in excess of 0.667.

(c) The attitude in which a landing gear unit is drop tested shall be such as to simulate the airplane landing condition which is critical from the standpoint of energy to be absorbed by the particular unit.

§ 4b.374 *Limit load factor determination*. (a) In determining the limit airplane inertia load factor, n , from the free drop tests described above, the following formula shall be used:

$$n = n_1 \frac{W_e}{W} + L$$

where:

n_1 = the load factor developed in the drop test, that is, the acceleration (dv/dt) in g 's is recorded in the drop test, plus 1.0.

(b) The value of n so determined shall not be greater than the limit load factor used in the landing conditions, § 4b.243.

§ 4b.375 *Reserve energy absorption drop tests*. If compliance with the reserve energy absorption condition specified in § 4b.372 (b) is demonstrated by free drop tests, the landing gear units shall be dropped from a free drop height of not less than 27 inches. If it is desired to simulate wing lift equal to the airplane weight, the units shall be dropped with an effective mass equal to

$$W_e = W \frac{h}{h+d}$$

where the symbols and other details are the same as in § 4b.373.

RETRACTING MECHANISM

§ 4b.381 *General*. The landing gear retracting mechanism and supporting structure shall be designed for the loads occurring in the flight conditions when the gear is in the retracted position. It shall also be designed for the combination of friction, inertia, brake torque, and air loads occurring during retraction and extension at any air speed up to 1.6 V_{s1} (flaps in the approach position at design landing weight), and any load factors up to those specified for the flaps-extended condition, § 4b.193. The landing gear, retracting mechanism, and airplane structure, including wheel well doors, shall be designed to withstand the flight loads occurring with the landing gear in the extended position at any speed up to 0.67 V_c unless other means are provided to decelerate the airplane in flight at this speed. Positive means shall be provided for the purpose of maintaining the wheels in the extended position.

[Amdt. 04-0, 11 F. R. 71, as amended by Amdt. 04b-5, 12 F. R. 3933]

§ 4b.382 *Emergency operation*. Emergency means of extending the landing gear shall be provided, so that the landing gear can be satisfactorily extended in the event of any reasonably probable failure in the normal retraction system. The emergency system shall provide for the failure of any single source of hydraulic, electric, or equivalent energy supply.

§ 4b.383 *Operation test*. Proper functioning of the landing gear retracting mechanism shall be demonstrated by operation tests.

§ 4b.384 *Position indicator and warning device*. When retractable landing wheels are used, means shall be provided for indicating to the pilot when the wheels are secured in either extreme position. In addition, landplanes shall be provided with an aural warning device which shall function continuously after all throttles are closed until the gear is down and locked. If a manual shut-off for the warning device is provided, it shall be arranged so that re-opening the throttles will render the warning device effective again, as specified above.

§ 4b.385 *Control*. The landing gear retraction control shall be located and shall operate as described in § 4b.423.

WHEELS AND TIRES

§ 4b.391 *Wheels*. Main landing gear wheels (i. e. those nearest the airplane center of gravity) shall be of an approved type in accordance with Part 15 of this subchapter. The rated static load of each main wheel shall not be less than the design take-off weight, divided by the number of main wheels. Nose wheels shall be tested in accordance with Part 15 of this subchapter for an ultimate radial load of not less than the maximum nose wheel ultimate loads obtained in the ground loads requirements, and for the corresponding side and burst loads specified in Part 15 of this subchapter.

§ 4b.392 *Tires*. (a) A landing gear wheel may be equipped with any make or type of tire: *Provided*, That the tire is a proper fit on the rim of the wheel, *And provided*, That the approved tire rating is not exceeded under the following conditions:

(1) Airplane weight equal to the design take-off weight.

(2) Load on main wheel tires equal to the airplane weight divided by the number of wheels.

(3) Load nose wheel tires (to be compared with the dynamic rating established for such tires) equal to the reaction obtained at the nose wheel, assuming the mass of the airplane concentrated at the center of gravity and exerting a force of 1.0 g downward and 0.31 g forward, the reactions being distributed to the nose and main wheels by the principles of statics with the drag reaction at the ground applied only at those wheels having brakes. When specially constructed tires are used to support an airplane, the wheels shall be plainly and conspicuously marked to that effect. Such markings shall include the make, size, number of plies, and identification marking of the proper tire.

(b) Approved ratings are those assigned by the Tire and Rlm Association or by the Administrator.

BRAKES

4b.396 General. All airplanes shall be equipped with brakes certificated in accordance with the provisions of Part 15 of this subchapter for the maximum certificated landing weight at sea level and the power-off stalling speed, V_{SO} , as defined in § 4b.93. The brake system shall be so designed and constructed that in the event of a single failure in any connection or transmitting element in the brake system (excluding the operating pedal or handle), or the loss of any single source of hydraulic or other brake operating energy supply, it shall be possible, as shown by suitable test or other data, to bring the airplane to rest under conditions specified in §§ 4b.111-4b.114 with a mean negative acceleration during the landing roll of at least 50 percent of that obtained in determining the landing distance under that section. In applying the requirements of §§ 4b.396-4b.398 to hydraulic brakes, the brake drum, shoes, and actuators (or their equivalents) shall be considered as connecting or transmitting elements unless it is shown that the leakage of hydraulic fluid resulting from failure of the sealing elements in these units would not reduce the braking effectiveness below that specified in this section.

§ 4b.396-1 Reverse thrust as substitute for dual brake system (CAA policies which apply to § 4b.396). The Administrator will permit the use of reverse thrust to show that a duplicate set of wheel brakes is unnecessary, only if it can be shown that such use provides a level of safety equivalent to that contemplated by the present regulations when wheel brakes alone are used, including proper consideration of pilot skill required and likelihood of attaining the necessary performance under conditions of simulated brake failure.

[12 F. R. 3438. Correction noted at 14 F. R. 37]

§ 4b.397 Parking brake. A parking brake control shall also be provided which may be set by the pilot and, without further attention, maintain braking sufficient to prevent the airplane from rolling on a paved runway while applying take-off power on the most critical engine.

§ 4b.398 Brake controls. Brake controls shall not require excessive control forces in their operation.

SKIS

§ 4b.406 Requirements. Skis shall be certificated in accordance with the ski requirements of Part 15 of this subchapter. The approved rating of the skis shall not be less than the maximum take-off weight of the airplane on which they are installed.

§ 4b.407 Installation. (a) The ski installation shall be made in accordance with the ski or airplane manufacturer's recommendations which shall have been approved by the Administrator.

(b) In addition to such shock cord(s) as may be provided, front and rear check

cables shall be used on skis not equipped with special stabilizing devices.

§ 4b.408 Tests. It shall be demonstrated that the airplane has satisfactory landing and taxiing characteristics and that the airplane's flight characteristics are not impaired by the installation of the skis.

HULLS AND FLOATS

§ 4b.416 Buoyancy (main seaplane floats). (a) Main seaplane floats shall have a buoyancy in excess of that required to support the gross weight of the airplane in fresh water as follows:

- (1) 80% in the case of single floats.
- (2) 90% in the case of double floats.

(b) Main seaplane floats shall contain at least 5 watertight compartments of approximately equal volume.

§ 4b.417 Buoyancy (boat seaplanes). The hulls of boat seaplanes and amphibians shall be divided into watertight compartments such that with any 2 adjacent compartments flooded, the hull and auxiliary floats (and tires, if used) will retain sufficient buoyancy to support the gross weight of the aircraft in fresh water without capsizing. Bulkheads may have watertight doors for the purpose of communication between compartments.

FUSELAGE

PILOT COMPARTMENT

§ 4b.421 General. (a) The arrangement of the pilot compartment and its appurtenances shall provide a satisfactory degree of safety and assurance that the pilot will be able to perform all his duties and operate the controls in the correct manner without unreasonable concentration and fatigue.

(b) The primary flight controls units listed on Figure 4b-17, excluding cables and control rods, shall be so located with respect to the propellers that no portion of the pilot or controls lie in the region between the plane of rotation of any in-board propeller and the surface generated by a line passing through the center of the propeller hub and making an angle of 5 degrees forward or aft of the plane of rotation of the propeller.

(c) When a second pilot is required for particular operations by Parts 40, 41, and 61 of this subchapter the airplane shall be fully and readily controllable from each seat.

(d) The pilot compartment shall be so constructed as to prevent leakage likely to be distracting to the crew or harmful to the structure when flying in rain or snow. A door or an adequate openable window shall be provided between the pilot compartment and the passenger compartment. When a door is provided, it shall be equipped with a locking means which will prevent passengers from opening such door without the pilot's permission.

§ 4b.422 Vision—(a) Nonprecipitation conditions. The pilot compartment shall be arranged to afford the pilots a sufficiently extensive, clear, and undistorted view to perform safely all maneuvers within the operating limitations of the airplane, including taxiing, take-off, approach, and landing. It shall be demonstrated by day and night flight

tests that the pilot compartment is free of glare and reflections that would interfere with the pilot's vision.

(b) **Precipitation conditions** (1) At least the first pilot shall be afforded an adequate view along the flight path in normal flight, approach, and landing, by the provisional means for maintaining appropriate areas of the windshield clear without continuous attention by the crew during the following conditions of precipitation:

(i) In heavy rain at all speeds up to $1.6 V_{SI}$, flaps retracted.

(ii) In severe icing conditions, whenever de-icing provisions are required for the particular operations by Parts 40, 41, and 61 of this subchapter.

(2) In all cases, at least the first pilot shall be provided with a window which is openable under the above conditions and is so arranged as to afford, through the opening, a view as specified above, with sufficient protection from the elements that his vision is not impaired. The window need not be opened under pressurized conditions.

(c) **Pilot windshield and windows.** All internal glass panes shall be of a nonsplintering safety type.

(d) **Bird impact.** The windshield, its supporting structure, and other structure in front of the pilots shall have sufficient strength to withstand without penetration the impact of a 4-pound bird when the relative velocity of the bird to the airplane along the flight path of the latter is equal to the value of V_c at sea level chosen in accordance with § 4b.189.

§ 4b.423 Cockpit arrangement. (a) All cockpit controls shall be so located and, except for the primary controls, identified as to provide satisfactory convenience in operation including adequate provisions to prevent the possibility of confusion and consequent inadvertent operation. (See Figs. 4b-17 and 4b-18 for direction of movement of aerodynamic, and certain power-plant, accessory, and auxiliary controls.) Wherever practicable the sense of motion involved in the operation of other controls shall correspond with the sense of the effect of the operation upon the airplane or the part operated.

(b) The controls shall be so located and arranged with respect to the pilot's seat that it will be readily possible for the operator to obtain full and unrestricted movement of each control without interference from either the cockpit structure or the operator's clothing when seated. This shall be demonstrated for individuals ranging from 5'2" to 6'0" in height.

(c) Identical power-plant controls for the several engines shall be so located as to prevent any misleading impression as to the engines to which they relate.

§ 4b.424 Instruments and markings. (See § 4b.696 relative to instrument arrangement.) The operational markings, instructions, and placards required for the instruments, controls, etc., are specified in § 4b.881-4b.904.

§ 4b.425 Noise and vibration. Vibration and noise characteristics of cockpit appurtenances shall be such as not to interfere with the safe operation of the airplane.

Controls	Type of control	Movement and actuation
Primary: Aileron..... Elevator..... Rudder..... Secondary: Flaps or auxiliary lift devices..... Trimming: Tabs or equivalent.....	Stick or Column with grip or wheel. Foot pedals or rudder bar..... Wheel (or Segment when actuation suggests rotary movement).	Right (clockwise) for right wing down. Rearward to pitch nose up. Right pedal forward for nose right. Down to extend. Rotate to produce similar rotation of the airplane about the axis which is parallel to the axis of the control being operated.

Wing flap or auxiliary lift device controls and the landing gear control shall be adequately separated to prevent confusion and subsequent inadvertent operation.

FIGURE 4b-17.—AERODYNAMIC CONTROLS.

Controls	Movement and actuation
Power plant: Throttles..... Propeller..... Mixture..... Carburetor air heat..... Auxiliary: Landing gear.....	Forward to increase power. Forward to increase revolutions per minute. Forward for rich. Forward for cold. Down to extend.

Wing flap or auxiliary lift device controls and the landing gear control shall be adequately separated to prevent confusion and subsequent inadvertent operation.

FIGURE 4b-18.—POWER-PLANT AND AUXILIARY CONTROLS.

EMERGENCY PROVISIONS

§ 4b.431 *Flotation.* (a) When certification of ditching provisions is desired under the provisions of § 4b.292, satisfactory evidence shall be submitted that there is every reasonable probability that the airplane, after landing in the water as specified in § 4b.292, would remain afloat, as follows:

(1) In the case of airplanes equipped with life rafts having capacity for all persons aboard the airplane, the floating time and trim would permit all occupants to leave their ditching stations and occupy the rafts.

(2) In the case of airplanes not equipped with life rafts having capacity for all persons aboard the airplane, the airplane would float indefinitely with sufficient compartments above the water line to accommodate all persons aboard the airplane.

(b) Compliance with the requirements of this section may be demonstrated by buoyancy and trim computations in which suitable allowances are made for probable structural damage and leakage. For airplanes equipped with fuel dump valves, the volume of fuel which could be dumped may be considered as buoyancy volume.

§ 4b.432 *Emergency exits.* Passenger and crew compartments designated as occupiable during take-off and landing shall be provided with emergency exits as specified in §§ 4b.433 and 4b.434. For the purposes of §§ 4b.432-4b.434, a compartment is defined as a closed space to which normal access is by a door, passageway, or stair that is likely to become a bottleneck in evacuating the airplane. In case of question concerning the adequacy and suitability of emergency exits, it shall be demonstrated that the airplane can be completely evacuated in 30 seconds, or in a time equal to 1 second per occupant, whichever is greater, under conditions simulating a forced landing. The maximum number of persons for which seats are provided shall be used in this demonstration. The persons demonstrating the evacuation procedure may

be briefed once prior to the official demonstration.

§ 4b.433 *Number of exits.* (a) The minimum number of exits per compartment is as follows:

Number of persons for which seats are provided:	Minimum number of exits required
5 or less.....	1
Exceeding 5, not exceeding 15.....	2
Exceeding 15, not exceeding 22.....	3
Exceeding 22, not exceeding 29.....	4
Exceeding 29, not exceeding 36.....	5
Exceeding 36, not exceeding 50.....	6

(b) The external door specified in § 4b.441 may be counted as one emergency exit if it meets the detail requirements of § 4b.434.

(c) The number of exits in any one compartment need not exceed 4 if an adjacent compartment can be reached through a passageway without a door and if the total exits in the 2 compartments exceeds at least 1 exit per 8 passengers. Other numbers of exits may be used if it can be demonstrated that the airplane can be evacuated in the time specified in § 4b.432.

§ 4b.434 *Exit arrangement.* (a) At least the minimum number of exits specified in § 4b.433 shall be located so as to give the maximum likelihood of their being usable in the emergency landing with wheels up. When certification of ditching provisions is desired, it shall be shown that at least one emergency exit for every 16 passengers is located above the water line as determined in § 4b.431.

(b) In airplanes for which 2 or more exits are required, the ratio of the number of exits on either side to the total number required shall be not less than one-third. In such cases at least one exit on the opposite side from the main door shall be operable from the outside and shall be marked accordingly for the guidance of rescue personnel.

(c) The exits shall be readily accessible, shall not require exceptional agility of a person using them and shall be distributed so as to facilitate egress without crowding. Each exit shall provide a

clear and unobstructed opening to the outside, the minimum dimensions of the opening shall be such that a 19 by 26 inch ellipse may be inscribed therein. Reasonable provisions shall be made against the jamming of exits as a result of fuselage deformation.

(d) The method of opening shall be simple and obvious and the exits shall be so arranged that they may be readily operated. (See § 4b.903.) The proper functioning of exits shall be demonstrated by test. At land plane exits which are more than 10 feet from the ground with the airplane on the ground and wheels retracted, suitable means shall be provided by which the occupants can safely descend to the ground.

PASSENGER AND CREW ACCOMMODATIONS

§ 4b.441 *External doors.* (a) Airplanes having closed cabins shall be provided with at least one adequate and easily accessible external main door. It shall be possible to open such door from either inside or outside by the operation of only one handle inside or one handle outside even though the persons using the exit may be crowded near it. The means of opening shall be simple and obvious and shall be so arranged and marked that it can be readily located and operated, even in darkness. Reasonable provisions shall be made to prevent the jamming of such door as a result of fuselage deformation in a minor crash.

(b) No door for regular use shall be so located that persons using it would be endangered by the propellers.

§ 4b.442 *Internal doors.* Where internal doors are equipped with louvers or other ventilating means, provision convenient to the crew shall be made for closing the flow of air through the door when such action is found necessary.

[Amdt. 04-1, 11 F. R. 11351]

§ 4b.443 *Seats, berths, and safety belts.*

(a) *Arrangement.* (1) At all stations designated as occupiable during take-off and landing, the seats, berths, belts or harness and surrounding parts of the airplane shall be so arranged that a person making proper use of the facilities provided would not suffer serious injury in the emergency landing conditions of §§ 4b.291 and 4b.292 as a result of contact of a vulnerable part of his body with any penetrating or relatively solid object. Passengers and crew shall be afforded protection from head injuries by one of the following or equivalent means:

(i) Safety belt and shoulder harness which will prevent the head from contacting any injurious object,

(ii) Safety belt and the elimination of all injurious objects within radius of the head in a fore and aft direction,

(iii) Safety belt and a cushioned rest which will properly support the arms, shoulders, head, and spine. This method may be applied to forward, sideward, and rearward facing seats.

(2) Suitable hand grips or rails shall be provided along aisles to enable passengers or crew members to steady themselves while using the aisles during moderately rough air flights. Any projecting objects likely to cause injury to persons

seated or moving about the airplane in normal flight shall be suitably padded.

(b) *Strength.* (1) All seats, berths, and supporting structure shall be designed for an occupant weighing at least 170 lbs. and the critical loads resulting from all specified flight load conditions.

(2) All seats and berths designated as occupiable during landing and take-off, and their supporting structure, shall also be designed for the loads resulting from the specified ground loads and the emergency landing conditions of §§ 4b.291 and 4b.292, including appropriate reactions from the safety belts or harness.

(3) Pilots' seats shall be designed for the reactions resulting from application of the pilot forces to the flight controls as specified in §§ 4b.231-4b.234.

§ 4b.445 *Ventilation and heating—*
(a) *Ventilation.* (1) All passenger and crew compartments shall be suitably ventilated. Carbon monoxide concentration shall not exceed 1 part in 20,000 parts of air, and fuel fumes shall not be present.

(2) Where partitions between compartments are equipped with louvers or other means allowing air to flow between such compartments, provision convenient to the crew shall be made for closing the flow of air through the louvers or other means when such action is found necessary.

(b) *Combustion heaters.* Gasoline operated combustion heater installations shall comply with applicable parts of the power plant installation requirements covering fire hazards and precautions. All applicable requirements concerning fuel tanks, lines, and exhaust systems shall be considered.

[Amdt. 04-0, 11 F. R. 71, as amended by Amdt. 04-1, 11 F. R. 11351]

§ 4b.445-1 *Technical Standard Order TSO-C20: "Combustion Heaters" (CAA rules which apply to § 4b.445 (b))—*

(a) *Introduction.* Under section 601 of the Civil Aeronautics Act of 1938, as amended, and §§ 3.31, 3.388 (b), 4a.31 and 4a.301 of this chapter, and §§ 4b.41 and 4b.445 (b), the Administrator of Civil Aeronautics is authorized to adopt standards for combustion heaters intended for use in civil aircraft. In adopting these standards, consideration has been given to existing Government and industry standards for combustion heaters.

(b) *Directive—(1) Provision.* The requirements for combustion heaters, as set forth in SAE Aeronautical Standard AS143B; Heaters, Airplane, Internal Combustion Heat Exchanger Type, dated February 1, 1949,¹ stated below, are hereby established as minimum safety standards for combustion heaters intended for use in civil aircraft:

1. *Purpose.* To specify standards covering minimum safety and performance requirements for internal combustion heaters and certain auxiliary devices which are considered necessary to the safety and performance of the heaters as used in aircraft. These standards are to be considered currently applicable and necessarily subject to revision from time to time due to rapid development of the aeronautical industry. The following standards

are based on practical engineering requirements for such internal combustion heat exchanger type heaters as are now used on airplanes and for such as may be developed to meet later requirements.

2. *Scope.* These standards are written to cover internal combustion heat exchanger type heaters used in the following applications:

2.1 Cabin heating. (All occupied regions and windshield heating.)

2.2 Wing and empennage heating.

2.3 Engine and accessory heating. (When heater is installed as part of the aircraft.)

3. *Definition.* An internal combustion heat exchanger type heater as used for airplane heating is one that utilizes through a heat exchanger the heat produced by combustion of a fuel within the heater for the purpose of heating the air being supplied to the airplane.

4. *General requirements.*

4.1 *Heater components.* An internal combustion type heater shall include all of the following:

4.1.1 Combustion chamber and heat exchanger assembly.

4.1.2 Casing or shroud for combustion chamber and heat exchanger assembly.

4.1.3 Igniter.

4.1.4 Burner.

4.1.5 Ventilating air inlet.

4.1.6 Ventilating air outlet.

4.1.7 Combustion air inlet.

4.1.8 Exhaust outlet.

4.1.9 Fuel inlet.

4.2 *Additional devices.* In addition to the heater, the following additional devices are considered necessary to the safety and performance of the heater and will be covered in that respect by these standards. These devices may be furnished separately or as part of the heater. These standards do not cover all tests necessary on these devices, but only those required in their relationship to the heater.

4.2.1 Fuel system.

4.2.1.1 Fuel nozzle, restrictor, orifice, or equivalent.

4.2.1.2 Fuel shutoff valve.

4.2.1.3 Fuel filter.

4.2.2 Safety controls.

4.2.2.1 A device to prevent the heater from becoming overheated.

4.2.2.2 A device to prevent fuel flow to the heater when combustion air is insufficient for safe operation.

4.2.3 Ignition system. (Required for spark ignition only.)

4.2.3.1 Device to provide high voltage power.

4.2.3.2 High voltage ignition lead assembly or equivalent electrical linkage between high voltage device and spark plug.

4.3 *Materials and workmanship.*

4.3.1 The heater and auxiliary equipment shall be constructed throughout of materials which are considered acceptable for the particular use intended and shall be made and furnished with a degree, uniformity, and grade of workmanship generally accepted in the aircraft industry.

4.3.2 The heater casing or shroud shall be constructed of fireproof material.

4.4 *Design features.*

4.4.1 The design shall be such as to preclude the possibility of discharging harmful concentrations of carbon monoxide into the ventilating air stream. See test, paragraph 6.5.4.1.

4.4.2 Where specified, the design shall be such as to preclude excessive loss of pressurized fuselage air. See test, paragraphs 6.5.4.2 and 6.5.4.3.

4.4.3 The design shall include protection against excessive radio interference. See test, section 6.4.

4.4.4 The design shall be such as to preclude harmful effects on construction or performance due to vibration. See test, section 6.3.

4.4.5 The design shall be such that the life of the heater and accompanying devices shall be comparable to other similar airframe components and accessories. See test, section 6.5.

4.4.6 Unless otherwise specified, the design shall be such that the heater and accompanying devices shall operate satisfactorily within normal ranges of power, fuel, and air supplies available in aircraft.

4.5 *Heater identification.* The following minimum information shall be legibly and permanently marked on the heater or on a nameplate attached thereto:

(a) Manufacturer's name and/or trademark.

(b) Manufacturer's part number.

(c) Manufacturer's serial number.

(d) SAE rated output, ----- B. t. u. hr. (See section 5.1)

(e) Rated fuel pressure, ----- psig.

(f) Electrical characteristics.

(g) SAE Spec. AS-143B. For Use: Unpr. cabin -----, Press. cabin -----, Wing ----- (Stamp "X" in one or more blanks as applicable.)

5. *Detail requirements.*

5.1 *SAE rating conditions.* Heater shall deliver at least SAE rated output at following conditions:

5.1.1 Sea level ambient pressure.

5.1.2 Rated fuel pressure, as specified by manufacturer.

5.1.3 Rated sea level combustion air rate, as specified by manufacturer.

5.1.4 Ventilating air temperature rise of 250° F.

5.1.5 Inlet temperature of fuel and air between 50° F. and 125° F.

5.2 *Air supply.*

5.2.1 When sufficient combustion or ventilating air for safe operation is not available the heater shall be made automatically inoperative. See tests, paragraphs 6.5.7.1 and 6.5.7.2.

5.2.2 The combustion air and ventilating air inlets on the heater shall be separated from each other.

5.3 *Fuel supply.*

5.3.1 The fuel lines and fittings under pressure in the heater shall be enclosed in such manner as to prevent any fuel leakage from entering the ventilating air stream, and the enclosure shall have adequate provision for draining to the combustion chamber or to a fuel drain fitting.

5.3.2 A fuel drain outlet or equivalent safety device shall be provided to prevent accumulation of fuel in the combustion chamber and heat exchanger assembly in case the fuel flows without igniting.

5.3.3 All fuel lines in the heater shall be constructed of steel or other fire resistant material. Where flexibility is required in these lines, flexible fire resistant coupled hose assemblies shall be used to eliminate the possibility of using hose clamp connections. Connections in metal fuel lines shall not employ solder nor other relatively low melting point materials which cannot withstand a 2000° F. flame for five minutes.

5.3.4 All gaskets, synthetic rubber seals, etc. shall be suitable for use with aromatic fuels and shall be satisfactory for use at the temperatures encountered within the overheating limits of the heater.

5.3.5 The fuel system lines, fittings and controls shall be sufficiently isolated from the combustion side of the heater to prevent their being damaged by flame, radiant heat or backfire.

5.4 *Combustion chamber and heat exchanger assembly.*

5.4.1 The combustion chamber and heat exchanger assembly shall be constructed from a corrosion and heat resistant material in accordance with SAE Aeronautical Material Specification AMS 5540, or equivalent.

5.4.2 Means shall be provided to minimize malfunctioning due to lead deposits and to permit disassembly and cleaning of all parts affected by products of combustion.

¹ Copies may be obtained from the Society of Automotive Engineers, 29 West 39th St., New York, N. Y.

5.4.3 The accumulation of lead scale or product of combustion deposits shall not cause functional failure before 500 hours of heater operation.

5.4.4 The heater combustion chamber and heat exchanger assembly shall be so designed that it will not rupture under the most severe explosion conditions that can occur with any possible fuel air mixture as demonstrated by test procedure outlined in section 6.1.6.

5.5 Exhaust.

5.5.1 The temperature of the exhaust gases at the point of discharge from the heater shall not exceed 1200° F. at rating. (See section 5.1.)

5.6 Ignition.

5.6.1 Ignition may be accomplished by:

5.6.1.1 Electrically heated resistance hot wire.

5.6.1.2 Electric high-voltage spark plug.

5.6.2 Ignition may be sustained during operation of the heater or discontinued if satisfactory combustion is assured.

5.6.3 The igniter shall be capable of functioning over a period of 200 hours without service. See test, section 6.5.5.

5.6.4 In event of ignition delay for an indefinite period, either with or without fuel supply, no hazardous condition shall result.

5.6.5 Heaters which are intended for wing-empennage heating shall ignite within 15 seconds under conditions of paragraph 6.1.2.3 except that the temperature shall not be higher than -20° F.

5.7 Safety controls. The following automatic safety controls shall be furnished separately or as part of the heater. These controls shall be independent of and in addition to the normal operating controls.

5.7.1 A control to shut off the heater fuel flow in case combustion air supply is insufficient for safe operation.

5.7.2 A control to prevent the heater from becoming overheated under any condition of ventilating air flow.

5.8 Lines and fittings.

5.8.1 All pipe and tubing fittings used shall comply with applicable AN standards.

5.8.2 Other fittings not covered above shall conform to accepted aircraft practice.

5.9 Electrical equipment.

5.9.1 All electrical equipment, including wiring, instruments, motors, insulation, shielding, relays, etc., shall conform to acceptable aircraft practice.

6. Test requirements and methods.

6.1 Performance tests. Tests shall be conducted to establish the following:

6.1.1 Ignition characteristic curve, plotting altitude as the ordinate and combustion air pressure differential as the abscissa such that the area under the curve represents the region of reliable starting and burning at -65° F. Include information on temperature of fuel and combustion air supplied to heater. The service ceiling of the heater and its accompanying ignition devices shall be defined as the peak of the ignition characteristic curve. A time record shall be kept on each test start.

6.1.2 Heat output, ventilating air pressure drop, combustion air pressure drop, exhaust temperature, ventilating air temperature rise, fuel rate at—

6.1.2.1 Sea level rating. (See section 5.1.)

6.1.2.2 Sea level rating, except with -65° F. inlet ventilating air, combustion air, and fuel temperatures.

6.1.2.3 20,000 feet pressure altitude with:

(a) Sea level rated weight of ventilating air at -65° F. inlet temperature.

(b) Combustion air at -65° F. inlet temperature, and combustion air pressure differential midway between 20,000 feet altitude ignition limits determined in 6.1.1.

(c) Sea level rated values of voltage and fuel pressure.

(d) Fuel at -65° F. inlet temperature.

NOTE: Temperature measurements for output shall be made in a manner which will provide a representative average temperature of the discharge air. Temperature sensing elements used in test shall be protected against effects of radiation from the heater.

6.1.3 Maximum starting and maximum running amperages required with normal voltage for operation of the heater and accompanying devices at sea level.

6.1.4 Voltage range within which the heater and accompanying devices will operate at sea level and service ceiling.

6.1.5 Collapsing pressure of the combustion chamber and heat exchanger assembly.

6.1.5.1 The heater shall be set up with an adjustable restriction on the combustion air inlet, and a source of vacuum connected to the exhaust outlet. The ventilating air shall discharge freely to atmosphere (sea level). A static pressure tap shall be provided in the exhaust pipe within 12" of the connection to the heater.

6.1.5.2 For a non-pressurized cabin heater or a wing-empennage heater, the heater shall be operated at sea level rating, except that the exhaust outlet pressure is to be maintained at a value which is at least 4 psi below the ventilating air outlet pressure. After operating the heater for at least one hour at these conditions, there must be no permanent distortion of any part of the heater, unless it can be demonstrated that such distortion does not affect the performance or life of the heater.

6.1.5.3 For pressurized cabin heaters, the test shall be the same as 6.1.5.2 except that the exhaust outlet pressure shall be maintained at a value which is at least 10 psi below the ventilating air outlet pressure.

6.1.6 Combustion chamber burst pressure. The following design test shall demonstrate compliance with section 5.4.4.

6.1.6.1 With the combustion chamber and heat exchanger assembly at room temperature, introduce a gaseous fuel air mixture in a ratio of from .085 to .095. Purge the combustion chamber and heat exchanger assembly with this mixture to the extent of at least ten times the volume of the combustion chamber and heat exchanger assembly. Ignite the mixture with the heater igniter. Repeat procedure to complete 50 explosions. The heater shall then meet the leakage requirements of section 6.5.4.2.

6.1.7 Radio interference noise levels. See test, section 6.4.

6.1.8 Effect of vibration of heater and accompanying devices. See test, section 6.3.

6.1.9 Minimum life and service requirements of heater and accompanying devices. See test, section 6.5.

6.2 Test report. The manufacturer shall furnish a report, on request, covering tests. This report shall include an introduction, a summary, a description of apparatus, instrumentation, and tests, the results, a discussion, and conclusions.

6.3 Vibration test. The heater and auxiliary equipment shall be capable of withstanding and satisfactorily operating when subjected to a steady vibration over a range of frequencies from 600 to 2,700 cycles per minute with a total excursion of 1/16", and from 2,700 to 3,200 cycles per minute with an acceleration not exceeding 6 G's. Unless otherwise specified in detail specifications, the equipment shall be mounted on the vibrating apparatus with the longitudinal axis of the heater in a plane parallel to the vibrating surface of the apparatus and normal to the direction of vibration.

6.3.1 The heater shall be vibrated over a range of from 600 to 2,700 cycles per minute with a total excursion of 1/16". The frequencies at which resonance occurs, if any, shall be observed and noted.

6.3.2 The heater will be vibrated over a range of from 2,700 to 3,200 cycles per minute with an acceleration of not less than 5 G's and not more than 6 G's. The frequencies at which resonance occurs, if any, shall be observed and noted.

6.3.3 If resonance is observed under the test of either 6.3.1 or 6.3.2, a vibration test shall be conducted for fifteen hours at the frequency showing the maximum resonance.

6.3.4 If no resonance is observed under the tests of 6.3.1 or 6.3.2, a vibration test shall be conducted for 15 hours at 2,700 cycles per minute with 1/16" total excursion.

6.3.5 At the conclusion of the vibration test there shall be no evidence of structural failure and the heater and accompanying devices shall operate satisfactorily.

6.4 Radio interference test.

6.4.1 The heater shall be set up with a sleeve of bare metal ductwork having the same diameter as the heater casing connected at each end of the casing. The length of each piece of ductwork shall be not less than five diameters and shall be connected to the heater with a clamp of the type normally used in an installation.

6.4.2 In the same manner as 6.4.1, connect ductwork or tubing to the combustion air inlet and to the exhaust outlet with respective dimensions determined by diameters of the combustion air inlet and exhaust outlet fittings.

6.4.3 If the ignition voltage transformer is not part of the heater, mount in external to the heater and connect the high voltage terminal to the spark plug by means of the high voltage ignition lead assembly.

6.4.4 With the ignition system operating, check the complete assembly including heater, high voltage device, and high voltage ignition lead assembly using the recommended procedure of specification JAN-I-225 dated June 14, 1945, and Radio Interference Noise Limit Specification AAF-32466-A dated October 17, 1945.

6.5 Life tests. Life tests may be conducted in such manner as to qualify the heater and accompanying devices for cabin heating, wing-empennage anti-icing, or both. For cabin heating only, the duration of the test shall be at least 850 hours "on" time. For wing-empennage anti-icing only, the duration of the test shall be at least 500 hours "on" time. For qualification of the heater and accompanying devices under both cabin heating and wing-empennage classifications, the duration of the test may be 850 hours heater "on" time providing at least 500 hours "on" time is performed at wing-empennage conditions.

6.5.1 General conditions. The general conditions applying to both cabin and wing-empennage heater life tests shall be as follows:

6.5.1.1 Tests shall be performed at sea level rated fuel pressure and sea level rated combustion air rate.

6.5.1.2 Inlet air temperature shall not exceed 125° F.

6.5.1.3 Approximately 50% of the life test shall be with "continuous" operation, and the remainder of the test with "rapid cycling" operation.

6.5.1.3.1 During "continuous" operation, the ventilating air rate shall be adjusted as required to give the specified temperature rise under steady conditions. At least once, and not more than twice, during each two hours of operating time, the fuel and ignition system shall be shut off and the heater permitted to cool for at least 10 minutes with continuous ventilating air and combustion air flow. In calculating total "on" time for the heater, the 10-minute cooling periods shall not be included.

6.5.1.3.2 During "rapid cycling" operation, a thermostatic switch in the ventilating air outlet stream shall cycle the fuel on and off to maintain a specified outlet air temperature. The ventilating air rate shall be adjusted so that the average heat output (assuming that the setting of the cycling switch represents the average outlet air temperature) is between 60 and 75% of the rated output. At least once, and not more than twice during each 2 hours of operating time, the fuel and ignition system shall be shut

off and the heater permitted to cool for at least 10 minutes with continuous ventilating air and combustion air flow. For cycling operation "on" time is defined as the total elapsed time during which the rapid cycling switch controls the heater operation; it does not include the 10-minute cooling periods.

6.5.2 *Cabin heater life tests.* The cabin heater life tests shall be divided into four periods, as follows:

6.5.2.1 *First period—250 hours.* Continuous operation, with the ventilating air rate adjusted to maintain a temperature rise of at least 200° F. and an outlet air temperature of at least 250° F.

6.5.2.2 *Second period—250 hours.* Rapid cycling operation, with the cycling switch set to control at $250 \pm 10^\circ$ F. outlet air temperature.

6.5.2.3 *Third period—175 hours.* Same conditions as first period.

6.5.2.4 *Fourth period—175 hours.* Same conditions as second period.

6.5.3 *Wing-empennage anti-icing heater life tests.* Wing-empennage anti-icing heater life tests shall be divided into two periods, as follows:

6.5.3.1 *First period—250 hours.* Continuous operation, with the ventilating air rate adjusted to maintain a temperature rise of at least 300° F. and an outlet air temperature of at least 350° F.

6.5.3.2 *Second period—250 hours.* Rapid cycling operation, with the cycling switch set to control at $350 \pm 10^\circ$ F. outlet air temperature.

6.5.4 *Performance after tests.* At the end of the life and vibration tests the heater shall meet the following requirements:

6.5.4.1 *Carbon monoxide contamination.* At rating conditions, and with the burner operating, carbon monoxide concentration in the heated ventilating air stream shall not exceed one part in 20,000 or 0.005 of 1%. This test shall be run with the heater exhaust discharging to atmosphere. The ventilating air samples shall be taken from an unrestricted duct fastened to the heater ventilating air outlet. The duct shall be the same diameter as the heater casing and at least 5 diameters in length. Use carbon monoxide detector assembly AAF No. 46B1790 or Navy Stock No. R-83-BUA-9258, or equivalent.

6.5.4.2 *Leakage.* With an air pressure of 8 psig inside the combustion chamber and heat exchanger assembly, leakage shall not exceed 9 lbs./hr. (sea level and 59° F.). There shall be no leaks which could allow liquid fuel to enter the ventilating air stream in event of ignition failure, when the heater is mounted in any normal position, with drains open.

6.5.4.3 For pressurized cabin heaters, with pressurized jacket, air leakage through the ventilating air shroud or casing shall not exceed 10 lbs./hr. at sea level and room temperature when air pressure of 16 psig is applied to the ventilating air passages.

6.5.4.4 When heater is to be used for wing-empennage anti-icing, the output shall be not less than 90% of the original rating after the life test. If the heater is to be used for cabin heating, the manufacturer shall record in the test report the heater output at the end of the life test.

6.5.5 *Igniter.* Whenever it becomes necessary due to ignition failure during the life test, the igniter may be cleaned, adjusted, or replaced. However, the igniter shall not require servicing or replacement more than twice during the life test of a wing-empennage heater or more than four times during the life test of a cabin heater.

6.5.6 *Fuel system.*

6.5.6.1 Whenever necessary due to stoppage or failure, the fuel orifice or nozzle may be cleaned or replaced. Such servicing shall not be required more than once during a wing-empennage heater life test or twice during a cabin heater life test.

6.5.6.2 The fuel shut off valve may be cleaned once during a wing-empennage

heater life test and twice during a cabin heater life test. It shall not be cleaned, serviced, or replaced due to failure to close during the life test. At the end of the life test the valve leakage in the closed position with rated fuel pressure shall not exceed two cubic centimeters of fuel in ten minutes.

6.5.6.3 The fuel filter may be cleaned or the filter element replaced but the filter body shall not be replaced during the life test. At the end of the life test there shall be no leakage through the case or body.

6.5.7 *Safety controls.*

6.5.7.1 The device used to prevent the heater from becoming overheated shall not be serviced or replaced during the life test due to failure to shut off the heater. At the beginning of the life test and at the end of each test period (section 6.5.2 or 6.5.3), any cycling or intermediate controls shall be bypassed and the ventilating air rate gradually reduced over a period of 15 minutes to permit operation of this device. Operation shall be within $\pm 25^\circ$ F. of the value obtained at the beginning of the life test.

6.5.7.2 The device to prevent fuel flow when combustion air is insufficient for safe operation shall be sensitive to heater combustion air pressure differential or to combustion air pressure. The device may be an air actuated electrical switch designed for use with an electrical fuel shut off valve, or an air actuated mechanical valve designed to control the flow of fuel.

6.5.7.2.1 If an air actuated electrical switch is used, it shall be checked as follows at the end of each test period (section 6.5.2 or 6.5.3) with the heater in operation:

6.5.7.2.1.1 Reduce the combustion air differential pressure or combustion air pressure gradually (approximately 30 seconds) from normal rating to a point where the switch closes the electrical fuel shut off valve. The combustion air differential pressure or combustion air pressure at which the fuel shut off valve closes shall not be less than the minimum value required for safe heater operation. At the end of 15 minutes "fuel off" time, the combustion air differential pressure or combustion air pressure, as applicable, shall be gradually increased at the same rate and the switch shall open the electrical fuel shut off valve at or above the rated combustion air pressure differential.

6.5.7.2.2 If an air actuated mechanical fuel valve is used it shall be checked as follows at the end of each test period (sections 6.5.2 or 6.5.3):

6.5.7.2.2.1 With the heater operating and with the fuel shut off valve "open", the combustion air differential pressure shall be reduced gradually (approximately 30 seconds) from normal rating to value required for safe heater operation. Leakage through the air actuated mechanical fuel valve shall then be measured and shall not exceed two cubic centimeters in ten minutes. At the end of 15 minutes "fuel off" time, the combustion air differential pressure shall be gradually increased at the same rate and the valve shall permit rated fuel flow when the rated combustion air pressure differential is reached.

6.5.7.3 *Ignition system.*

6.5.7.3.1 If necessary, the high voltage device may be serviced or parts replaced once during the life test.

6.5.7.3.2 If necessary, the high voltage ignition lead assembly or equivalent may be serviced or replaced once during the life test.

6.5.7.4 Unless otherwise specified, items 6.5.7.1, 6.5.7.2, 6.5.7.2.1, 6.5.7.2.2, 6.5.7.3, and 6.5.7.3.2, if furnished separately, not as part of the heater, need not be tested more than once providing no changes are made in their design, construction, or adjustment.

6.5.7.5. In case of life test failure of one or more of the devices in items 6.5.7.1, 6.5.7.2, 6.5.7.2.1, 6.5.7.2.2, 6.5.7.3, and 6.5.7.3.2, the test may be continued to qualify the heater or devices that have not failed. A separate life

test shall apply only to the failed device if necessary to establish reliability.

7. *Desirable features (Not Mandatory).*

7.1 *Operation.*

7.1.1 The operation of the heater and accompanying devices should require a minimum of moving parts.

7.1.2 The heater should start operation within five seconds at -65° F. at sea level and at its service ceiling, and should reach its maximum output within three minutes after being started.

7.1.3 The heater should be designed in such a manner as to preclude violent explosions on being started.

7.1.4 The heater should be designed in such a manner and made from such materials as to withstand deteriorating effects of high humidity, condensation, fungus, and abrasive particles in the air.

7.1.5 The heater and its accompanying devices should not be adversely affected if subjected to ambient temperatures up to 160° F. for indefinite periods.

7.1.6 The heater should be designed to give low air pressure drop at high altitudes.

7.1.7 Where necessary, additional devices such as the following, may be provided to improve heater operation.

7.1.7.1 Air pressure regulator.

7.1.7.2 Fuel pressure regulator.

7.1.7.3 Combustion air blower.

7.1.7.4 Ventilating air blower.

7.1.7.5 Fuel air ratio control.

7.1.7.6 Thermal cycling switch.

7.1.7.7 Cabin heat controls.

7.2 *Igniter.* The igniter should be accessible for quick replacement or servicing.

7.3 *Fuel nozzle.* The fuel nozzle should be accessible for quick replacement or servicing.

(2) *Application.* (i) Combustion heaters complying with the specifications appearing in this order are hereby approved for all aircraft. Heaters already approved by the Administrator may continue to be installed in aircraft:

(a) For which an application for original type certificate is made prior to the effective date of this order.

(b) The prototype of which is flown within one year after the effective date of this order, and

(c) The prototype of which is not flown within one year after the effective date of this order if due to causes beyond the applicant's control.

(ii) If an alteration involving a change in type or model of heater is made within nine months after the effective date of this order, previously approved types of heaters may be installed. However, in any such change made after the nine-month period, new types of heaters installed shall meet the specifications contained herein.

(c) *Specific instructions—(1) Marking.* In addition to the identification information required in the referenced specification, each heater shall be permanently marked with the Technical Standard Order designation, CAA-TSO-C20, to identify the heater as meeting the requirements of this order in accordance with the manufacturers' statement of conformance outlined in subparagraph (5) of this paragraph. This identification will be accepted by the Civil Aeronautics Administration as evidence that the established minimum safety requirements for combustion heaters have been met.

(2) *Data requirements.* Ten copies of the following technical information shall be submitted by the manufacturer of the heater with his Statement of Con-

formance to the Civil Aeronautics Administration, Aircraft Service, Attn: A-298, Washington 25, D. C.:

(i) Rated combustion air flow rates (or pressure drop) including minimum safe rate and variation with altitude.

(ii) Rated ventilating air flow rates (or pressure drop) including minimum safe rate and variation with altitude.

(iii) Ignition characteristics curve established in accordance with Section 6.1.1 of Specification AS143B.

(iv) Minimum operating voltage used for subdivision (iii) of this subparagraph.

(v) Maximum operating altitude.

(vi) Operating fuel pressure.

(vii) Installation diagram showing installation of safety devices necessary to achieve compliance with Sections 4.2, 5.7 and 6.5.7 through 6.5.7.2.2.1 of Specification AS143B.

(viii) Recommended electrical arrangement and any necessary limitations and pressure or temperature settings which are considered essential to proper and safe installation and operation.

(3) *Effective date.* After June 15, 1949, specifications contained in this order will constitute the basis for Civil Aeronautics Administration approval of combustion heaters for use in certificated aircraft.

(4) *Deviations.* Requests for deviation from, or waiver of, the requirements of this order, which affect the basic airworthiness of the component, should be submitted for approval by the Chief, Aircraft Service, Office of Aviation Safety, Civil Aeronautics Administration. These requests should be addressed to the nearest Regional Office of the Civil Aeronautics Administration, Attn: Superintendent, Aircraft Branch.

(5) *Conformance.* (i) The manufacturer shall furnish to the Civil Aeronautics Administration, Aircraft Service, Attn: A-298, Washington 25, D. C., a written statement of conformance signed by a responsible official of his company, setting forth that the heater to be produced by him meets the minimum safety requirements established in this order. This statement shall indicate whether the heater meets the standards for cabin or wing-empennage heaters as prescribed in SAE Aeronautical Standard AS-143B and whether it has met the standards of this specification pertinent to pressurized systems. Immediately thereafter distribution of the heaters conforming with the terms of this order may be started and continued.

(ii) The prescribed identification on the heater does not relieve the aircraft manufacturer or owner of responsibility for the proper application of the heater in his aircraft, nor waive any of the requirements concerning type certification of the aircraft in accordance with existing Civil Air Regulations.

(iii) If complaints of nonconformance with the requirements of this order are brought to the attention of the Civil Aeronautics Administration, and investigation indicates that such complaints are justified, the Administrator will take appropriate action to restrict the use of the product involved.

(iv) Copies of this Technical Standard Order and other Technical Standard Orders may be obtained from the Civil

Aeronautics Administration, Aviation Information Staff, Washington 25, D. C.

[Supp. 7, 14 F. R. 3308]

§ 4b.447 *Cabin interiors.* All compartments occupied or used by the crew or passengers shall comply with the following provisions:

(a) Materials shall in no case be less than flash-resistant.

(b) The wall and ceiling linings, the covering of all upholstery, floors, and furnishings shall be flame-resistant.

(c) Compartments where smoking is to be permitted shall be equipped with ash trays of the self-contained type which are completely removable. All other compartments shall be placarded against smoking.

(d) All receptacles for used towels, papers, and waste shall be of fire-resistant material, and shall incorporate covers or other provisions for containing possible fires started in the receptacles.

[Amtd. 04-1, 11 F. R. 11351]

§ 4b.447-1 *Fire-resistant aircraft material (CAA rules which apply to § 4b.447).* See § 4b.448-3.

[13 F. R. 7728]

§ 4b.448 *Cargo and baggage compartments—(a) General.* Each cargo and baggage compartment shall be designed for the placarded maximum weight of contents and critical load distributions at the appropriate maximum load factors corresponding to all specified flight and ground load conditions, excluding the emergency landing conditions of §§ 4b.291 and 4b.292. Provisions shall be made to prevent the contents of such compartments from becoming a hazard by shifting under these loads. The provisions also shall be adequate to protect the passengers and crew from injury by the contents of any compartment when the ultimate inertia force acting forward is 6 g.

(b) *Fire precautions.* (1) Each compartment shall be designed so that, when used for the purpose of storing cargo or baggage, it shall comply with all the requirements prescribed for cargo or baggage compartments. It shall include no controls, wiring, lines, equipment, or accessories, the damage or failure of which would affect the safe operation of the airplane, unless such item is adequately shielded, isolated, or otherwise protected so that it cannot be damaged by movement of cargo in the compartment, and so that any breakage or failure of such item would not create a fire hazard in the compartment. Provisions shall be made to prevent cargo or baggage from interfering with the functioning of the fire-protective features of the compartment. All materials used in the construction of cargo or baggage compartments, including tie-down equipment, shall be flame-resistant or better.

(2) In addition, all cargo and baggage compartments shall include provisions for safeguarding against fires according to the following classifications:

(i) Cargo and baggage compartments shall be classified in the A category, if presence of a possible fire therein can be

readily discernible to a member of the crew while at his station, and if all parts of the compartment are easily accessible in flight. A hand fire extinguisher shall be available for such compartment.

(ii) Cargo and baggage compartments shall be classified in the B category, if sufficient access is provided while in flight to enable a member of the crew to move by hand all contents and to reach effectively all parts of the compartment with a hand fire extinguisher. Furthermore, the design of the compartment shall be such that, when the access provisions are being used, no hazardous quantity of smoke, flames, or extinguishing agent will enter any compartment occupied by the crew or passengers. Each compartment in this category shall be equipped with a separate system of an approved type smoke detector or fire detector other than heat detector to give warning at the pilot or flight engineer station. Hand fire extinguishers shall be readily available for use in all compartments of this category. Compartments in this category shall be completely lined with fire-resistant material, except that additional service lining of flame-resistant material may be employed.

(iii) Cargo and baggage compartments shall be classified in the C category if they do not conform with the requirements for the A or B categories. Each compartment of the C category shall be equipped with: (a) A separate system of an approved type smoke detector or fire detector other than heat detector to give warning at the pilot or flight engineer station, and (b) an approved built-in fire extinguishing system controlled from the pilot or flight engineer station. Means shall be provided to exclude hazardous quantities of smoke, flames, or extinguishing agent from entering into any compartment occupied by the crew or passengers. Ventilation and drafts shall be further controlled within each such cargo or baggage compartment to the extent that the extinguishing agent provided can control any fire which may start within the compartment. All cargo and baggage compartments of this category shall be completely lined with fire-resistant material, except that additional service lining of flame-resistant material may be employed.

(c) *Proof of compliance.* Compliance with those provisions of § 4b.448 (b) which refer to the compartment accessibility, the entry of hazardous quantities of smoke or extinguishing agent into compartments occupied by the crew or passengers, and the dissipation of the extinguishing agent in category C compartments shall be demonstrated by tests in flight. It shall also be demonstrated during these tests that no inadvertent operation of smoke or fire detectors in adjacent or other compartments within the airplane would occur as a result of fire contained in any one compartment, either during or after extinguishment, unless the extinguishing system floods such compartments simultaneously.

[Amtd. 04-1, 11 F. R. 11351]

§ 4b.448-1 *Technical Standard Order TSO-C1a: "Smoke Detectors" (CAA rules which apply to § 4b.448 (b))—(a) Intro-*

duction. (1) Smoke detectors are in the class of aircraft components which the Administrator of Civil Aeronautics is authorized to approve in accordance with Parts 4a and 4b of this subchapter.

(2) This Technical Standard Order is intended to serve as a criterion by which the product manufacturer can obtain Civil Aeronautics Administration approval of his smoke detector.

(3) In the establishment of this Technical Standard Order, consideration has been given to existing Government and industry standards for smoke detectors for the purpose of adopting the performance requirements of one of the recognized aeronautical standards as the minimum safety requirements for smoke detectors which are intended for use in civil aircraft. The specification of the Society of Automotive Engineers for smoke detectors contains such requirements.

(b) *Directive.*

(1) *Provision.* Pursuant to §§ 4a.31, 4a.301, 4b.41, and 4b.448 of this subchapter, which authorize the Administrator to approve aircraft equipment, the performance requirements for smoke detectors as set forth in SAE Specification AS-400, Smoke Detectors, dated July 1, 1947,¹ stated below, with the exceptions hereinafter noted, are established as the minimum safety requirements for smoke detectors which are intended for use in civil aircraft:

1. *Purpose.* To specify minimum requirements for smoke detection instruments for use in aircraft, the operation of which may subject the instrument to environmental conditions specified in section 3.4.

2. *Scope.* This specification covers two basic types as follows:

Type I. Carbon monoxide.

Type II. Photoelectric cell.

3. *General requirements.*

3.1. *Material and workmanship.*

3.1.1. *Material.* Materials shall be of a quality which experience or tests have demonstrated to be suitable and dependable for use in aircraft instruments.

3.1.2. *Workmanship.* Workmanship shall be consistent with high-grade aircraft instrument manufacturing practice.

3.2. *Radio interference.* The instrument shall not be the source of objectionable interference, under operating conditions at any frequencies used on aircraft, either by radiation or feed-back, in radio sets installed in the same aircraft as the instrument.

3.3. *Identification.* The following information shall be legibly and permanently marked on the instrument or attached thereto:

- (a) Name of instrument (smoke detector).
- (b) SAE Spec. AS-400.
- (c) Rating (electrical, vacuum, etc.).
- (d) Manufacturer's part number.
- (e) Manufacturer's serial number or date of manufacture.
- (f) Manufacturer's name and/or trademark.

3.4. *Environmental conditions.* The following conditions have been established as design criteria only. Tests shall be conducted as specified in sections 5, 6, and 7.

3.4.1. *Temperature.* When mounted in accordance with the instrument manufacturer's instructions, the instrument shall function over the range of ambient temperature of -55° C. to 60° C. and shall not be adversely

affected by exposure to temperatures in the range -65° C. and to 70° C.

3.4.2. *Humidity.* The instrument shall function and not be adversely affected when exposed to a relative humidity of up to and including 95% at a temperature of approximately 32° C.

3.4.3. *Altitude.* The instrument shall function and not be adversely affected when subjected to a pressure and temperature range equivalent to -1,000 feet to +40,000 feet standard altitude.

3.4.4. *Vibration.* When mounted in accordance with the instrument manufacturer's instructions, the units shall function and shall not be adversely affected when subjected to the following vibrations:

Type of instrument mounting	Cycles per minute ¹	Amplitude ¹	Max. acceleration
Shock mounted panel instruments	500-3000	Inch 0.005	0.8 g
Unshock mounted panel instruments	500-3000	.010	1.3 g
Airframe structure mounted instruments	500-3000	.030	3.8 g

¹ It is understood that the unit shall withstand vibrations at higher frequencies, but the acceleration values need not exceed those shown above.

When specified by the purchaser for use in rotary wing aircraft, the frequency range shall be 150-3000 cycles per minute.

4. *Detail requirements.*

4.1. *Design.*

4.1.1. The instrument shall consist of a means for:

Type I: Testing air for contamination with gaseous products of combustion. It shall include an alarm circuit or control circuit which will indicate the presence of contamination when it reaches a concentration of not more than 0.010% of carbon monoxide by volume.

Type II: Testing air for contamination with smoke or gas of all colors or particle sizes. It shall include an alarm circuit or control circuit which will indicate the presence of contamination which reduces the light transmission to not less than 90% of that of clear air. Percentage of transmission is defined as the light falling on a photoelectric cell through a one foot distance as compared to the light transmitted in clear air.

4.1.2. A means shall be incorporated in the design to admit the air sample to the sensitive element of the instrument in a positive manner.

4.2. *Indicating method.* The instrument shall be capable of actuating both visual and aural alarm indicators.

4.3. *Reliability.* False signals in the instrument shall not result from variations in voltage (+25% and -100% of the rated), flight altitude, accelerations encountered in flight or landing, and from normal amounts of dust they may accumulate within the instrument under normal flight operation.

4.4. *Integrity test provision.* The instrument shall be provided with a means for being tested in flight. The test shall cause operation of the alarm circuit or control circuit by initiating the sequence of actions through a disturbance in the instrument.

4.5. *Sampling characteristics.* When an instrument installation is designed to divert the air samples from more than one sampling station, it shall cycle at a rate not to exceed 30 seconds per sampling station, in which case, flow of air through all the sampling conduits shall be maintained continuously. In addition, when a smoke alarm is indicated, an alarm shall be actuated to indicate the location in which the smoke or gas is being generated and to continue to indicate the alarm until the condition is eliminated. It shall begin cycling in a normal manner within 30 seconds after releasing the alarm signal.

5. *Test conditions.*

5.1. *Atmospheric conditions.* Unless otherwise specified, all tests required by this specification shall be made at an atmospheric pressure of approximately 29.92 inches of mercury and at an ambient temperature of 22° C. When tests are made with the atmospheric pressure or the temperature substantially different from these values, allowance shall be made for the variations from the specified conditions.

5.2. *Vibration (to minimize friction).* Unless otherwise specified, all tests for performance may be made with the instrument subjected to a vibration of 0.002 to 0.005 inch amplitude at a frequency of 1,500 to 2,000 cycles per minute. The term amplitude as used herein indicates the total displacement from positive maximum to negative maximum.

5.3. *Vibration stand.* A vibration stand shall be used which will vibrate at any desired frequency between 500 and 3,000 cycles per minute and shall subject the instrument to vibration such that a point on the instrument will describe, in a plane inclined 45 degrees to the horizontal plane, a circle, the diameter of which is equal to the amplitude specified herein.

5.4. *Test position.* Unless otherwise specified, the instrument shall be mounted and tested in its normal operation position.

5.5. *Air sample.* Unless otherwise specified, air samples shall be as follows:

(1) Air containing 0.01% plus or minus 0.005% carbon monoxide, or

(2) Air containing smoke or gas having a light transmission value of 85% to 92% of that of clear air.

5.6. *Power conditions.* Unless otherwise specified all tests for performance shall be conducted at the power rating recommended by the manufacturer.

6. *Individual performance requirements.* All instruments, or components of such, shall be subjected to whatever tests the manufacturer deems necessary to demonstrate specific compliance with this specification including the following requirements where applicable.

6.1. *Response time.* The instrument shall be tested, so that, when an air sample per section 5.5 is introduced into the instrument under normal room temperature and atmospheric pressure conditions the alarm circuit or control circuit shall be energized within a maximum of 30 seconds.

6.2. *Dielectric.* The insulation shall be subjected to a dielectric test with an R. M. S. voltage at a commercial frequency applied for a period of 5 seconds equivalent to 5 times normal circuit operating voltage, except where circuits include components for which such a test would not be appropriate the test voltage shall be 1.25 times the normal circuit operating voltage. The insulation response shall not be less than 20 megohms at that voltage.

7. *Qualification tests.* As many instruments as deemed necessary to demonstrate that all instruments will comply with the requirements of this section shall be tested in accordance with the manufacturer's recommendations. The tests of each instrument shall be conducted consecutively and after the tests have been initiated, no further adjustments of the instrument shall be permitted. For those instruments which employ a cycling device for testing a multiplicity of locations with one instrument, these tests shall be conducted on the basis of a single sample station. During these tests no false alarm shall result.

7.1. *Stability.* The instrument shall be operated continuously for 24 hours at room temperature. At the end of the first and twenty-fourth hour of operation a sample of air, per section 5.5, shall be introduced into the instrument and the time required for operation of the alarm circuit or control circuit shall not exceed 30 seconds.

7.2. *Suction variation.* The instrument shall be operated continuously by varying the

¹ Copies may be obtained from the Society of Automotive Engineers, 29 West 39th St., New York, N. Y.

suction from 25% below to 25% above the rated. At each of these values a sample of air, per section 5.5, shall be introduced into the instrument and the time required for operation of the alarm circuit or control circuit shall not exceed 30 seconds.

7.3. Voltage variation. The instrument shall be operated with the voltage varying from 110% to 85% of the rated voltage. The instrument shall then be tested with an air sample, per section 5.5, and the response time shall not exceed 30 seconds.

7.4. High temperature. The instrument shall be exposed to a temperature of 70° C. for a period of 6 hours after which it shall be tested with air at 60° C. for a period of 30 minutes without giving a false alarm. The instrument shall then be tested with an air sample, per section 5.5, and the response time shall not exceed 30 seconds.

7.5. Low temperature. The instrument shall be exposed to a temperature of -65° C. for a period of 24 hours, after which it shall be raised to a temperature of -55° C. for a period of 6 hours. After operating for 30 minutes at a temperature -55° C., without giving a false alarm, the response time to the air sample in section 5.5 shall not exceed 30 seconds.

7.6. Humidity. The instrument shall be subjected to an atmosphere 32° C. with a relative humidity of 95%, with the air sample being taken from the same atmosphere. After operating in this manner for 5 hours, an air sample per section 5.5, shall be introduced into the instrument and the time required for operation of the alarm circuit or control circuit shall not exceed 30 seconds.

7.7. Altitude effect. The instrument shall be subjected to an altitude pressure equivalent to 40,000 feet. After operating in this manner continuously for five hours the time required for reaction of the alarm circuit or control circuit, on a sample of air per section 5.5, shall not exceed 30 seconds.

7.8. Vibration. The instrument shall be mounted on a vibration stand, in its own shock-mounted base, if provided with one, in its normal operating plane. The test shall be conducted with the instrument in normal operation condition. The instrument shall be subjected to vibration with an amplitude between 0.003 and 0.005 inch at frequencies from 500 to 3,000 cycles per minute, in order to determine whether the natural frequency of the instrument does occur in this frequency range.

7.9. Vibration endurance. With the instrument mounted on a vibration stand, per section 7.8 and with the instrument in a normal operating condition, it shall be vibrated continuously at a total amplitude of 0.03 inch for a period of 24 hours at the natural frequency, if applicable, as determined in section 7.8, or if not applicable at a frequency of 2,000 cycles per minute. At the completion of this test the instrument shall be examined to determine that no looseness in the mechanism nor damage to any part has resulted from the vibration and also, it shall be subjected to a sample of air introduced into it as per section 5.5 and the response time shall not exceed 30 seconds.

(2) Exceptions. Section 4.1.1, Design. Second sentence of Type II: "It shall include an alarm circuit or control circuit which will indicate the presence of contamination which reduces the light transmission to not less than 84% nor more than 96% of that of clear air."

Section 5.5, Air sample. Subparagraph (2): "Air containing smoke or gas having a light transmission value of 84% to 96% of that of clear air. A bar placed across light path to provide necessary light cut-off which has been calibrated against smoke may be used in place of actual smoke samples."

Section 7.3, Voltage variation. "The instrument may be operated with the voltage varying from 110% to 90% of the rated voltage. The response time to an air sample per section 5.5 shall not exceed 30 seconds."

Section 7.4, High temperature. "An air temperature of 45° C. is acceptable for the test after six hours of exposure at 70° C. The response time to an air sample per section 5.5 shall not exceed 30 seconds."

Section 7.5, Low temperature. "The instrument may be exposed to a temperature of -54° C. for a period of 24 hours after which time it shall be operated for a period of 30 minutes at -54° C. without giving a false alarm. The response time to an air sample per section 5.5 shall not exceed 30 seconds."

(3) Application. (i) Smoke detectors complying with the specifications appearing in this order are hereby approved for all aircraft. Smoke detectors already approved by the Administrator may continue to be installed in aircraft:

(a) For which an application for original type certificate is made prior to the effective date of this order,

(b) The prototype of which is flown within 1 year after the effective date of this order, and

(c) The prototype of which is not flown within 1 year after the effective date of this order if due to causes beyond the applicant's control.

(ii) If a major change is made in the installation within 9 months after the effective date of this order involving a change in type or model of smoke detector, previously approved types of smoke detectors may be installed. However, in any such change made after the 9-month period, new types of smoke detectors installed shall meet the specifications contained herein.

(c) Specific instructions.

(1) Marking. In addition to the identification information required in the referenced specification, each smoke detector shall be permanently marked with the Technical Standard Order designation "CAA-TSO-C1a" to identify the smoke detector as meeting the requirements of this order in accordance with the manufacturer's statement of conformance outlined below. This identification will be accepted by the Civil Aeronautics Administration as evidence that the established minimum safety requirements for the smoke detector have been met.

(2) Data requirements. Ten copies of the following technical information shall be submitted to the Civil Aeronautics Administration, Aircraft and Components Service, Attn: A-298, Washington 25, D. C.:

Installation recommendations prepared by the manufacturer covering the proper location, mounting, test circuits, and related technical information essential to insure proper functioning and maintenance of the unit as installed in the aircraft.

(3) Effective date. After June 1, 1948, specifications contained in this Technical Standard Order will constitute the basis for Civil Aeronautics Administra-

tion approval of smoke detectors for use in certificated aircraft.

(4) Deviations. Requests for deviation from, or waiver of, the requirements of this order, which affect the basic airworthiness of the component, should be submitted for approval by the Director, Aircraft and Components Service, Office of Safety Regulation, Civil Aeronautics Administration. These requests should be addressed to the nearest regional office of the Civil Aeronautics Administration, Attn: Superintendent, Aircraft and Components Branch.

(5) Conformance. (i) The manufacturer shall furnish to the CAA (address as noted under "Data requirements" above), a written statement of conformance signed by a responsible official of his company, setting forth that the smoke detector to be produced by him meets the minimum safety requirements established in this order. Immediately thereafter distribution of the smoke detector conforming with the terms of this order may be started and continued.

(ii) The prescribed identification on the smoke detector does not relieve the aircraft manufacturer or owner of responsibility for the proper application of the smoke detector in his aircraft, nor waive any of the requirements concerning type certification of the aircraft in accordance with existing Civil Air Regulations.

(iii) If complaints of nonconformance with the requirements of this order are brought to the attention of the Civil Aeronautics Administration, and investigation indicates that such complaints are justified, the Administrator will take appropriate action to restrict the use of the product involved.

(iv) Copies of this Technical Standard Order and other Technical Standard Orders may be obtained from the Civil Aeronautics Administration, Aviation Information Staff, Washington 25, D. C.

[13 F. R. 3843, 7728]

§ 4b.448-2 Technical Standard Order TSO-C11: "Fire Detectors" (CAA rules which apply to § 4b.448 (b)).

Introduction. (1) Fire detectors are in the class of aircraft components which the Administrator of Civil Aeronautics is authorized to approve in accordance with Parts 4a and 4b of this subchapter.

(2) This Technical Standard Order is intended to serve as a criterion by which the product manufacturer can obtain Civil Aeronautics Administration approval of his fire detector.

(3) In the establishment of this Technical Standard Order, consideration has been given to existing Government and industry standards for fire detectors for the purpose of adopting the performance requirements of one of the recognized aeronautical standards as the minimum safety requirements for fire detectors which are intended for use in civil aircraft. The specification of the Society of Automotive Engineers for fire detectors contains such requirements.

(b) Directive.

(1) Provision. Pursuant to §§ 4a.31, 4a.301, 4b.41, 4b.448, 4b.671, 4b.672, and 4b.691 of the Civil Air Regulations, which authorize the Administrator to approve

aircraft equipment, the performance requirements for fire detectors as set forth in SAE Specification AS-401, Fire and Heat Detectors, dated December 1, 1947,¹ stated below, with the exceptions herein-after noted, are hereby established as minimum safety requirements for fire detectors which are intended for use in civil aircraft:

FIRE AND HEAT DETECTORS

1. *Purpose.* To specify minimum requirements for fire and heat detection instruments for use in aircraft, the operation of which may subject the instrument to environmental conditions specified in section 3.4.

2. *Scope.* This specification covers the following basic types of instruments, or combinations thereof, intended for use in protecting aircraft power plant installations, auxiliary power plants, combustion heaters and other installation where fuel, oil or similar fires may occur.

Type I. Rate of temperature rise.

Type II. Flame.

Type III. Fixed temperature.

3. *General requirements.*

3.1. *Materials and workmanship.*

3.1.1. *Materials.* Materials shall be of a quality which experience and/or tests have demonstrated to be suitable and dependable for use in aircraft instruments.

3.1.2. *Workmanship.* Workmanship shall be consistent with high-grade aircraft instrument manufacturing practice.

3.2. *Radio interference.* The instrument shall not be the source of objectionable interference, under operating conditions at any frequencies used on aircraft, either by radiation or feed-back, in radio sets installed in the same aircraft as the instrument.

3.3. *Identification.* The following information shall be legibly and permanently marked on the instrument or attached thereto:

- (a) Name of instrument.
- (b) SAE Spec. AS-401.
- (c) Rating (electrical, vacuum, etc.).
- (d) Alarm temperature (sensing element, where applicable).
- (e) Manufacturer's part number.
- (f) Manufacturer's serial number or date of manufacture.
- (g) Manufacturer's name and/or trademark.

3.4. *Environmental conditions.* The following conditions have been established as design criteria only. Tests shall be conducted as specified in sections 5, 6, and 7.

3.4.1. *Temperature.* When mounted in accordance with the manufacturer's recommendations, the unit shall function over the range of ambient temperatures shown in column A below and shall not be adversely affected by exposure to the temperatures shown in column B below:

Instrument location	A	B
Power plant compartments.....	-20° to 130° C.	-65° to 130° C.
Other areas.....	-20° to 70° C.	-65° to 70° C.

3.4.2. *Humidity.* The instrument shall function and not be adversely affected by exposure to a relative humidity of up to and including 95% at a temperature of approximately 32° C.

3.4.3. *Altitude.* The instrument shall function and shall not be adversely affected when subjected to a pressure and temperature range equivalent to -1,000 feet to +40,000 feet standard altitude.

3.4.4. *Vibration.* When mounted in accordance with the instrument manufacturer's instructions, the units shall function and shall not be adversely affected when subjected to the following vibrations at a frequency of 500 to 3,000 cycles per minute. When specified by the purchaser for use in rotary wing aircraft, the frequency range shall be 150 to 3,000 cycles per minute.

Type of instrument mounting	Amplitude	Acceleration
Structurally mounted instruments.....	Inch 0.030	3.8 g
Engine compartment mounted instruments.....	.20	25 g

It is understood that the instrument shall withstand vibration at higher frequencies, but the acceleration values need not exceed those shown above.

4. *Detail requirements.*

4.1. *Indicating method.* The instrument shall be capable of actuating both visual and aural alarm indicators.

4.2. *Reliability.* False signals in the instrument shall not result from variations in voltage between 0 and 125% of the rated flight altitude, dust and accelerations encountered in flight or landing.

4.3. *Integrity test provisions.* The instrument shall permit testing of the continuity of the associated electrical circuit in flight.

4.4. *Calibration adjustment.* All calibration adjustments in the instrument shall be provided with tamper-proof seals.

5. *Test conditions:*

5.1. *Atmospheric conditions.* Unless otherwise specified, all tests required by this specification shall be conducted at an atmospheric pressure of approximately 29.92 inches of mercury and at an ambient temperature of approximately 22° C. When tests are conducted with the atmospheric pressure or the temperature substantially different from these values, allowance shall be made for the variations from the specified conditions.

5.2. *Vibration (to minimize friction).* Unless otherwise specified, all tests for performance may be made with the instrument subjected to a vibration of 0.002 to 0.005 inches amplitude at a frequency of 1,500 to 2,000 cycles per minute. The term amplitude as used herein indicates the total displacement from positive maximum to negative maximum.

5.3. *Vibration stand.* A vibration stand shall be used which will vibrate at any desired frequency between 500 and 3,000 cycles per minute and shall subject the instrument to vibration such that a point on the instrument will describe, in a plane inclined 45 degrees to the horizontal plane, a circle, the diameter of which is equal to the amplitude specified herein.

5.4. *Test position.* Unless otherwise specified, the instrument shall be mounted and tested in its normal operation position.

5.5. *Power conditions.* Unless otherwise specified, all tests shall be conducted at the power rating recommended by the manufacturer and the instrument shall be in an operating condition.

5.6. *Flame temperature measurement and flame size.* All flame temperatures shall be measured by using an 18 gauge wire thermocouple and the two strands of wire shall be twisted together for a distance of 1/2 inch from the thermocouple bead. The thermocouple bead shall be at the center of the flame and the two wires leading to the bead shall be parallel and extend radially into the flame. The nature and size of the flame and the method of test shall be specified in Figure 2.

5.7. *Test sample.* Unless otherwise specified, when qualification tests are being conducted on continuous type detectors, at least eight inches of the continuous detecting element shall be subjected to the test conditions as well as at least two typical insulators, supports, or connectors of each basic type used.

6. *Individual performance tests.* All instruments or components of such shall be subjected to whatever tests the manufacturer deems necessary to demonstrate specific compliance with this specification.

6.1. *Response time.* The sensing element shall be tested as specified in section 7.1, or in some equivalent manner which will adequately check the sensitivity and calibration.

6.2. *Dielectric.* The instrument shall be subjected to whichever one of the following dielectric tests is most applicable:

6.2.1. *Ungrounded instruments, or grounded instruments prior to connection of internal ground wire, shall be tested by either the method of section 6.2.1.1 or 6.2.1.2.*

6.2.1.1. *Insulation resistance.* The insulation resistance measured at 500 volts d-c between all electrical circuits connected together and the metallic case shall not be less than 20 megohms.

6.2.1.2. *Dielectric strength.* The insulation shall withstand without evidence of damage the application of a sinusoidal voltage at a commercial frequency between all electrical circuits connected together and the metallic case, for a period of 5 seconds. The R. M. S. value of the sinusoidal voltage applied shall be either five (5) times the maximum instrument operating voltage, or 500 volts, whichever is the greater.

6.2.2. *Instruments operated with a permanent internal ground connection shall be tested as follows:*

The insulation shall withstand without evidence of damage the application of a sinusoidal voltage at a commercial frequency between each electric circuit and the metallic case, for a period of 5 seconds. The R. M. S. value of the sinusoidal voltage applied shall be 1.25 times the maximum circuit operating voltage obtainable between two test points.

7. *Qualification tests.* As many instruments as appear necessary to demonstrate that all instruments will comply with the requirements of this section shall be subjected to the following tests where applicable. The tests on each instrument shall be conducted consecutively and after the tests have been initiated, no further adjustments of the instrument shall be permitted. There shall be no false alarms signalled during any of the tests. A response time test per section 7.1 shall be conducted after each qualification test, except sections 7.1.1, 7.2, 7.3, 7.3.1, 7.3.2, 7.3.3 and 7.14. However, except in the case of the response time test following the qualification test of section 7.14, the instrument subjected to the response time test need not be the same instrument or instrument's being subjected to the entire series of qualification tests.

7.1. *Response time.* The sensing element shall be tested in an 815° C. maximum temperature flame as specified in Figure 2. The ambient temperature from which the test is started shall be normal room temperature. However, a higher starting ambient temperature may be used if the sensing element is specified for use only in locations where the ambient temperature will not, under any normal continuous operating conditions, fall below this value. For types of detectors and detector systems whose sensitivity is affected by the number of sensing elements, by the length of the sensing element exposed to flame (for continuous types), or by other factors which may be varied from one system design to another, all response time tests shall be conducted with the least sensitive system configuration to be used. The time of response shall not exceed 5 seconds when the instrument is tested in accordance with this section.

7.1.1. *Repeat response time.* The sensing element(s) of the fire detector system shall be subjected to an 815° C. flame for a period of one minute. It shall then be removed

¹Copies may be obtained from the Society of Automotive Engineers, 29 West 39th St., New York, N. Y.

from the flame. Within 5 seconds after the alarm has cleared the sensing element shall again be subjected to the flame. An alarm shall be signalled in five seconds. The units subjected to this test need not be subjected to any other tests.

7.2. *Fixed temperature operation.* (For Type III instruments only.) The detecting element shall be placed in a suitable heating chamber and the temperature shall be raised at the rate of not less than 7° C. per minute, to not less than 80% of the rated temperature setting. The temperature shall be maintained at this value for not less than one hour. The temperature shall then be raised, at a rate of not more than 7° C. per minute, to 10% above the rated temperature setting. An alarm shall be signalled within a tolerance of 10% of the rated temperature setting. The temperature shall then be lowered, at a rate of not more than 7° C. per minute. The alarm indication shall cease before the temperature falls below 90% of the rated setting.

7.3. *False alarm due to rate of temperature rise.* No alarm shall be signalled during these tests except in the case of Type III instruments which may signal an alarm when the temperature reaches a value not less than 90% of the rated setting. For

sand hopper (should hold enough sand for complete test)

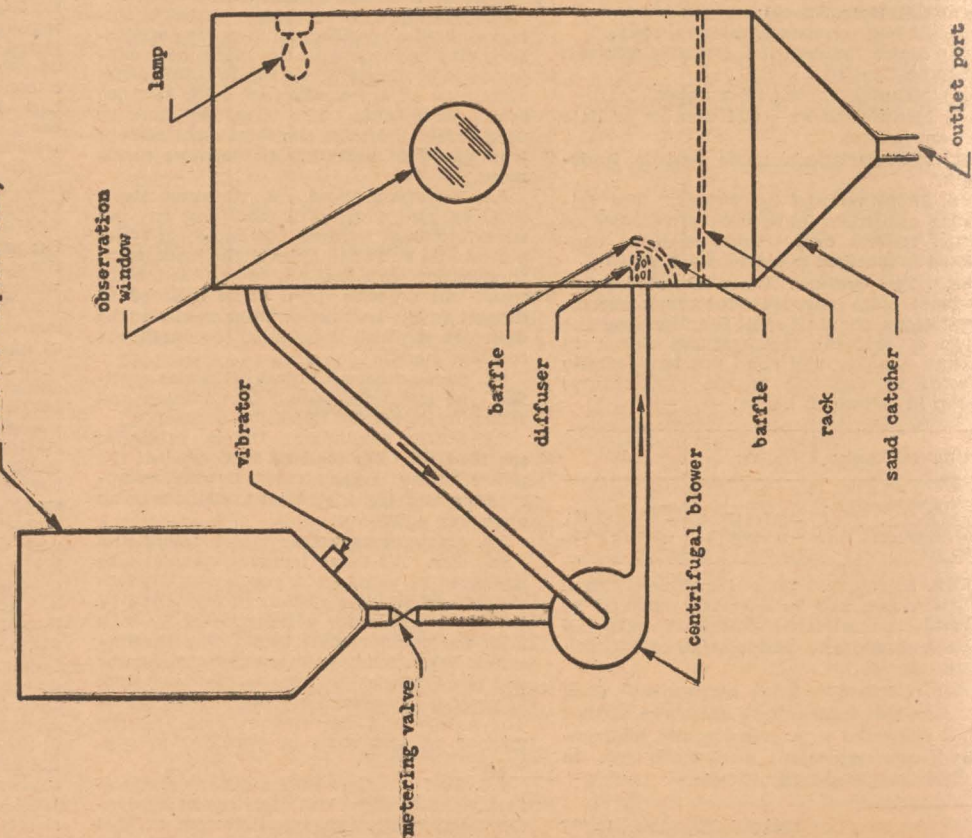

FIGURE 1.—SCHEMATIC SAND TEST ARRANGEMENT (REFERENCE SEC. 7.9).

types of detectors and detector systems whose sensitivity is affected by the number of sensing elements, the length of the sensing element exposed to the test temperature (for continuous types), or by other factors which may be varied from one system design to another, the tests of 7.3.1 and 7.3.2 shall be conducted with the most sensitive system configuration to be used.

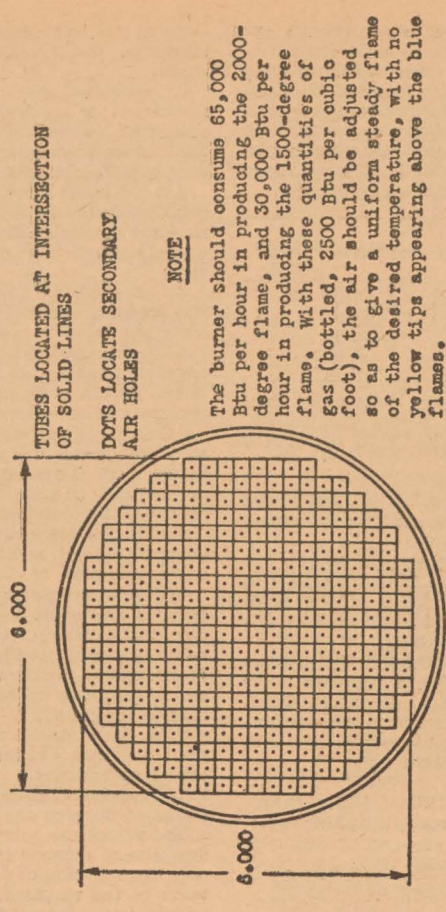

FIGURE 2.—FLAME TEST BURNER (REFERENCE SECS. 5.6, 7.1 AND 7.14).

ducted in a manner simulating conditions due to local overheating.

7.3.2. *False alarm due to general temperature rise.* The test of 7.3.1 shall be repeated except that Figure 3 (b) shall be employed and the test shall be conducted in a manner simulating conditions existing due to a general temperature rise throughout an engine compartment where the sensing element(s) may be located.

7.3.3. *False clearing of alarm due to partial extinguishing of fire.* The system configuration specified in 7.3 shall be subjected to an 815° C. flame for 30 seconds. The flame shall then be removed from all except the portion of the system as specified in 7.1. The alarm shall not clear. After an additional 30 seconds the flame shall be removed entirely and the alarm shall then clear. The units subjected to this test need not be subjected to any other test.

7.4. *Vibration.* The instrument shall be mounted on a vibration stand, in its own shock mounted base, if provided with one, in its normal operating plane. The instrument shall be subjected to vibration with an amplitude between 0.003 and 0.005 inch at frequencies for 500 to 3,000 cycles per minute, in order to determine whether the natural frequency of the instrument occurs in this frequency range.

7.5. *Vibration endurance.* With the instrument mounted on a vibration stand, per section 7.4, it shall be vibrated continuously at a total amplitude as specified in section 3.4.4 for a period of 24 hours at the natural frequency, if applicable, as determined in section 7.4, or if not applicable, at a frequency of 2,000 cycles per minute. No damage shall be evident after this test. In the case of this test, the response time test of 7.1.1 shall be conducted while the instrument is being vibrated. However, the sensing and indicating elements need not be vibrated si-

multaneously unless it is apparent that simultaneous vibration will be critical.

7.6. *Water spray.* All parts of the instrument which may be installed in exposed portions of the airplane shall be subjected to the following tests:

7.6.1. *Simulated rain.* The components being tested shall be subjected to a spray of water, to simulate rain, for a period of three hours. The detector shall not be dried prior to testing per section 7.1.

7.6.2. *Salt spray.* The components being tested shall be subjected to spray with a 20% sodium chloride solution for a period of fifteen minutes. The components shall then be dried in air at room temperature before they are tested per section 7.1. The components shall not be cleaned before the test of section 7.1 is conducted.

7.7. *Corrosion.* All parts of the instrument which may be installed in exposed portions of the airplane shall be subjected to a finely atomized spray of 20% sodium chloride solution for 200 hours. At the end of this period the parts shall be allowed to dry and may then be cleaned prior to conducting the test per section 7.1.

7.8. *Fuel and oil immersion.* All parts of the instrument which may be located in engine compartments, or other locations where they may be contaminated by fuel or oil, shall be subjected to the following tests:

7.8.1. *Fuel immersion.* The components being tested shall be thoroughly immersed in normally leaded 100 octane fuel at approximately room temperature and then allowed to drain for one minute before being tested per section 7.1. No cleaning other than the drainage specified above shall be accomplished prior to conducting subsequent tests.

7.8.2. *Oil immersion.* The same test shall be conducted with used SAE #60 oil.

7.9. *Sand.* All parts of the instrument which may be installed in exposed portions of the airplane (such as in nacelles, wheel wells, etc.) shall be subjected to a sand or dust laden air stream, flowing at a constant rate of 2½ pounds per hour, for four hours. The stream shall be formed of sand or dust that has been sifted through a 150 mesh screen and shall pass over all parts of the units under test. The test chamber shall be equivalent to that shown in Figure 1.

7.10. *High temperature.* All components of the instrument which may be located in engine compartments shall be exposed to a temperature of 130° C. for 48 hours prior to being tested per section 7.1 except a 130° C. All other components shall be subjected to a similar test at 70° C.

7.11. *Low temperature.* The instrument shall be exposed to a temperature of -65° C. for a period of 24 hours, after which it shall be raised to a temperature of -55° C. for a period of six hours prior to being tested per section 6.1 except at -55° C. However, compliance with section 7.1 shall be considered to have been accomplished in this case if the time of response does not exceed 10 seconds.

7.12. *Altitude effects.*

7.12.1. *High altitude and rate of climb.* The instrument shall be subjected to a pressure that is varied from normal atmospheric pressure to an altitude pressure equivalent to 40,000 feet at a rate of not less than 3,000 feet per minute. The instrument shall be maintained at the altitude pressure equivalent to 40,000 feet for a period of 48 hours. The instrument shall then be returned to sea level conditions and then tested per section 7.1. Sealed units shall not leak as a result of exposure to this pressure. Where applicable, this shall be demonstrated by immersion in water after the test.

7.12.2. *Low altitude.* The instrument shall be subjected to the same test as outlined in section 7.12.1, except that the rate of pressure variation need not be as specified therein and the pressure shall be maintained at an altitude pressure equivalent to -1,000 feet.

7.12.3. *Pressurization test.* All components of the instrument which may be located in pressurized area shall be subjected to an external pressure of 8 p. s. i. for a period of fifteen minutes. The response time test of 7.1.1 shall be conducted while the components involved are under the 8 p. s. i. pressure.

7.13. *Voltage variation.* The instrument shall be operated with the voltage varying from 110% to 75% of the rated. The instrument shall then be tested per section 6.1 under these conditions. Compliance with the provisions of section 4.2 shall also be demonstrated.

7.14. *Flame.* The detecting element of the instrument shall be subjected to a completely enveloping flame at a temperature of 1,100° C. minimum for two periods of one minute each. The flame shall be as specified in Figure 2. The instrument shall be cooled to approximately room temperature or to the ambient temperature permitted in section 7.2 after each exposure to flame. The instrument shall then be exposed to the same flame a third time. An alarm shall be signalled in not more than five seconds after each exposure to flame. During cooling of the instrument after the first two exposures to flame the alarm shall clear in not more than 45 seconds after the flame has been removed in the first two cases. Artificial means of cooling the instrument shall not be used until after the alarm has cleared. A manual resetting device may be used to clear the alarm provided it is demonstrated that the resetting device will clear the alarm only if the flame has been removed; i. e., if flame is still present and the manual resetting device is operated, the instrument must continue to indicate the presence of a fire. The instrument need not clear the alarm and need not be capable of further operation after the third exposure to flame. During this test the

FIGURE 3 (a).—LOCAL TEMPERATURE RISE CONDITION (REFERENCE SEC. 7.3.1).

FIGURE 3 (b).—GENERAL TEMPERATURE RISE CONDITION (REFERENCE SEC. 7.3.2).

sensing element shall be subjected to vibration as specified in section 7.5.

(2) *Exceptions.* Item (b) of section 3.3, "Identification," need not be complied with for conformance with the terms of this order.

(3) *Application.* (i) Fire detectors complying with the specifications appearing in this Technical Standard Order are hereby approved for all aircraft for protection of aircraft power plant installations, combustion heaters, or other installations where fuel, oil or similar fires may occur. Fire detectors already approved by the Administrator may continue to be installed in aircraft:

(a) For which an application for original type certificate is made prior to the effective date of this order,

(b) The prototype of which is flown within 1 year after the effective date of this order, and

(c) The prototype of which is not flown within 1 year after the effective date of this order if due to causes beyond the applicant's control provided application for a type certificate is made prior to the effective date of this order.

(ii) If a major change is made in the installation within 9 months after the effective date of this order involving a change in type or model of fire detector, previously approved types of fire detectors may be installed. However, in any such change made after the 9-month period, new types of fire detectors installed in aircraft shall meet the specifications contained herein.

(c) *Specific instructions.*

(1) *Marking.* In addition to the identification information required in the referenced specification (see paragraph (b) (2) above), each fire detector shall be permanently marked with the Technical Standard Order designation "CAA-TSO-C11" to identify the fire detector as meeting the requirements of this order in accordance with the manufacturer's statement of conformance outlined below. This identification will be accepted by the Civil Aeronautics Administration as evidence that the established minimum safety requirements for fire detectors have been met.

(2) *Data requirements.* Ten copies of the following technical information shall be submitted by the manufacturer of the fire detector with his statement of conformance to the Civil Aeronautics Administration, Aircraft Service, Attn: A-298, Washington 25, D. C. These data shall consist of all information such as descriptive data, drawings, diagrams, etc., which are necessary to define the limitations of use for which the fire detectors are satisfactory, and which are essential to outline the conditions for their proper installation and operation. They shall include at least the following, wherever applicable, in addition to other limitations which may apply:

(i) Maximum allowable normal ambient temperature at the point of detector location.

(ii) Maximum allowable rate of temperature rise at point of detector location as a result of normal operation.

(iii) Electrical circuit arrangement.

(iv) Operating voltage.

(v) Mounting or support method.

(vi) Maximum or minimum number of units or detector length which can be used

in one circuit or one fire zone without adversely affecting sensitivity or causing false indications due to temperature variations associated with normal operation.

(3) *Effective date.* After August 1, 1948, specifications contained in this Technical Standard Order will constitute the basis for Civil Aeronautics Administration approval of fire detectors for use in certificated aircraft.

(4) *Deviations.* Requests for deviation from, or waiver of, the requirements of this order, which affect the basic airworthiness of the component, should be submitted for approval by the Director, Aircraft Service, Office of Aviation Safety, Civil Aeronautics Administration. These requests should be addressed to the nearest regional office of the Civil Aeronautics Administration, Attn: Superintendent, Aircraft Branch.

(5) *Conformance.* (i) The manufacturer shall furnish to the CAA (address as noted in paragraph (c) (2) above), a written statement of conformance signed by a responsible official of his company, setting forth that the fire detector to be produced by him meets the minimum safety requirements established in this order. Immediately thereafter distribution of the fire detector conforming with the terms of this order may be started and continued.

(ii) The prescribed identification on the fire detector does not relieve the aircraft manufacturer or owner of responsibility for the proper application of the fire detector in his aircraft, nor waive any of the requirements concerning type certification of the aircraft in accordance with existing Civil Air Regulations.

(iii) If complaints of nonconformance with the requirements of this order are brought to the attention of the Civil Aeronautics Administration and investigation indicates that such complaints are justified, the Administrator will take appropriate action to restrict the use of the product involved.

(iv) Copies of this Technical Standard Order and other Technical Standard Orders may be obtained from the Civil Aeronautics Administration, Aviation Information Staff, Washington 25, D. C. [13 F. R. 3857, 7728]

§ 4b.448-3 *Technical Standard Order TSO-C11: "Fire-Resistant Aircraft Material"* (CAA rules which apply to § 4b.448 (b))—(a) *Introduction.* (1) Fire-resistant aircraft material is in the class of aircraft components which the Administrator of Civil Aeronautics is authorized to approve in accordance with Parts 3, 4a, 4b, and 6 of this subchapter.

(2) This Technical Standard Order is intended to serve as a criterion by which the product manufacturer can obtain Civil Aeronautics Administration approval of his fire-resistant aircraft material.

(3) In the establishment of this Technical Standard Order, consideration has been given to existing Government and industry standards for fire-resistant aircraft material for the purpose of adopting the performance requirements of one of the recognized aeronautical standards as the minimum safety requirements for fire-resistant materials which are intended for use in civil aircraft. The

specification of the Society of Automotive Engineers for fire-resistant aircraft materials contains such requirements.

(b) *Directive.*

(1) *Provision.* Pursuant to §§ 3.31, 3.625, 4a.31, 4a.400, 4b.41, 4b.447, 4b.448, 4b.592, 4b.623, 4b.654, 4b.665, 4b.676, 6.6, and 6.47 of the Civil Air Regulations, which authorize the Administrator to approve aircraft material, the performance requirements for fire-resistant aircraft material as set forth in section 3 of SAE Specification AMS-3851, Fire-Resistant Properties for Aircraft Materials, dated May 1, 1948,¹ stated below, are hereby established as minimum safety requirements for fire-resistant material which is intended for use in civil aircraft.

1. *Acknowledgment.* A vendor shall mention his specification number in all quotations and when acknowledging purchase orders.

2. *Application.* Primarily intended to cover materials which may be used without further treatment in areas in air carrier aircraft where a fire-resistant material is required.

3. *Technical requirements.* The material as supplied shall be capable of meeting the following test:

If the material is rigid an 8 x 8 in. specimen shall be used. If flexible, the material shall be placed in a frame, exposing an area 8 x 8 in. Where backing material is used, the specimen shall be provided with the same backing. The test specimen shall be supported at an angle of 45 degrees. The Bunsen or Tirrill burner shall rest upon a horizontal surface. The burner shall be adjusted for no air intake, giving a yellow tipped, 1½ in. flame. Suitable precautions shall be taken to avoid drafts. The period of application shall be 30 sec with ¼ of the flame in contact with the material at the approximate center of the specimen. Upon removal of the flame source from the specimen, the flame shall extinguish itself within 15 sec and no smoldering or glowing shall be visible 10 sec thereafter. No complete penetration of the material shall result.

4. *Reports.* Unless otherwise specified, the vendor shall furnish, with the original sample submitted for approval, three copies of a notarized report of the results of the test noted above showing duration of flaming, time of smoldering, char width, and penetration. After approval, unless otherwise specified, vendor shall furnish with each shipment three copies of a notarized report of the results of the above test made on each grade or type of each lot or shipment of material contained in the order. This report shall include the purchase order number, this specification number, vendor's material number, and quantity.

5. *Packing and identification.*

5.1 Packaging shall be accomplished in such a manner as to insure that the materials being shipped will not be torn or damaged and will be protected against exposure and undue weathering and harmful materials of any kind.

5.2 Each package shall be permanently and legibly marked, and the material tagged or stamped to give the following information:

Material description -----
AMS 3851
Meets fire resistance requirement AMS 3851
Vendor's identification -----
Purchase order number -----

6. *Approval.* A vendor shall not supply material until samples have been approved by the purchaser. After approval changes in

¹ Copies may be obtained from the Society of Automotive Engineers, 29 West 89th St., New York, N. Y.

composition, production manufacturing procedures and processes shall not be made without prior written approval by purchaser. Results of tests on incoming shipments shall be essentially equal to those obtained on approved samples.

7. *Rejections.* Material not conforming to this specification or to authorized modifications will be subject to rejection. Unless otherwise stipulated, rejected material will be returned to vendor at vendor's expense, unless purchaser receives, within three weeks of notification of rejection, other instructions for disposition.

(2) *Application.* Fire-resistant materials complying with the specifications appearing in this Technical Standard Order are hereby approved for all aircraft. Mandatory dates for the installation of such material are provided in §§ 41.20 (f), 42.10 (b) and 61.31 (b) (2) of the Civil Air Regulations.

(c) *Specific instructions.*

(1) *Marking.* In addition to the identification information required in the referenced specification, the material shall be permanently marked with the Technical Standard Order designation "CAA-TSO-C17" to identify the materials as meeting the requirements of this order in accordance with the manufacturer's statement of conformance outlined below. This identification will be accepted by the Civil Aeronautics Administration as evidence that the established minimum safety requirements for fire-resistant materials have been met.

(2) *Data requirements.* None.

(3) *Effective date.* See paragraph (b) (2) of this section.

(4) *Deviations.* Requests for deviation from, or waiver of, the requirements of this order, which affect the basic airworthiness of the component, should be submitted for approval by the Director, Aircraft Service, Office of Aviation Safety, Civil Aeronautics Administration. These requests should be addressed to the nearest regional office of the Civil Aeronautics Administration, Attn: Superintendent, Aircraft Branch.

(5) *Conformance.* (i) The manufacturer shall furnish to the Civil Aeronautics Administration, Aircraft Service, A-298, Washington 25, D. C., a written statement of conformance signed by a responsible official of his company, setting forth that the fire-resistant material to be produced by him meets the minimum safety requirements established in this order. Immediately thereafter distribution of the material conforming with the terms of this order may be started and continued.

(ii) The prescribed identification on the fire-resistant material does not relieve the aircraft manufacturer or owner of responsibility for the proper application of the fire-resistant material in his aircraft, nor waive any of the requirements concerning type certification of the aircraft in accordance with existing Civil Air Regulations.

(iii) If complaints of nonconformance with the requirements of this order are brought to the attention of the Civil Aeronautics Administration, and investigation indicates that such complaints are justified, the Administrator will take appropriate action to restrict the use of the product involved.

(iv) Copies of this Technical Standard Order and other Technical Standard Orders may be obtained from the Civil Aeronautics Administration, Aviation Information Staff, Washington 25, D. C.

[13 F. R. 7728]

§ 4b.448-4 *Technical Standard Order TSO-C19: "Portable Water-Solution Type Fire Extinguishers"* (CAA rules which apply to § 4b.448 (b) (2) (i) and (ii))—(a) *Introduction.* Under section 601 of the Civil Aeronautics Act of 1938, as amended, and §§ 4a.31, 4a.532, 4b.41, 4b.448 (b) (2) (i) and (ii) and 4b.691 (c) of this chapter, the Administrator of Civil Aeronautics is authorized to adopt standards for portable fire extinguishers intended for use in civil aircraft. In adopting these standards, consideration has been given to existing Government and industry standards for portable water-solution type fire extinguishers.

(b) *Directive.*—(1) *Provision.* The performance requirements for portable water-solution type fire extinguishers, as set forth in sections 5 and 6 of SAE Specification AS-245 Water-Solution Type Hand Fire Extinguishers dated November 1, 1948,* stated below, are hereby established as minimum safety performance standards for portable water-solution type fire extinguishers intended for use in civil aircraft:

1. *Purpose.* To specify minimum requirements for a water solution type hand fire extinguisher which shall be suitable for use on incipient fires which may occur in an airplane cabin interior. The type of fire for which these units are intended is one involving combustible materials such as paper, textiles, and similar materials.

2. *Scope.* This specification covers two basic types as follows:

Type I..... Stored pressure type.
Type II..... Cartridge operated type.

3. *General requirements.*

3.1 *Material and workmanship.*

3.1.1 *Materials.* Materials shall be of a quality which experience or tests have demonstrated to be suitable and dependable for use in aircraft equipment and with extinguishing medium used.

3.1.2 *Workmanship.* Workmanship shall be consistent with high-grade aircraft equipment manufacturing practice.

3.2 *Identification.* The following information shall be legibly and permanently marked on the extinguisher:

- (a) Name of extinguisher.
- (b) SAE Spec. No. AS-245.
- (c) Capacity.
- (d) Test pressure of container.
- (e) Manufacturer's part or model number.
- (f) Manufacturer's name and/or trade mark.
- (g) Operating and maintenance instructions.

3.3 *Environmental conditions.* The following conditions have been established as design requirements only. Tests shall be conducted as specified in sections 5 and 6.

3.3.1 *Temperature.* This extinguisher shall withstand, without deterioration temperatures from -40° F. to +140° F., and shall operate satisfactorily within that temperature range.

3.3.2 *Humidity.* The extinguisher shall function and shall not be adversely affected when exposed to any relative humidity in

* Copies may be obtained from the Society of Automotive Engineers, 29 West 39th St., New York, N. Y.

the range of from 0 to 95% at a temperature of approximately 90° F.

3.3.3 *Altitude.* The extinguisher shall function and not be adversely affected when subjected to a pressure and temperature range equivalent to -1,000 feet to +40,000 feet standard altitude, except as limited by the application of 3.3.1.

3.3.4 *Vibration.* When mounted in accordance with the extinguisher manufacturer's instructions the unit shall not be adversely affected when subjected to a vibration of 2,400 cycles per minute with a total excursion of $\frac{3}{32}$ " and when subjected to a vibration of 3,000 cycles per minute with a total excursion of 0.015 inch.

4. *Detail requirements.*

4.1 *Design.*

4.1.1 The extinguisher shall consist of:

Type I: A container having a dischargeable capacity of at least 1½ quarts, a connection for pressurizing the unit and a means of controlling the discharge of the liquid content.

Type II: A container having a dischargeable capacity of at least 1½ quarts, a suitable holder and releasing means for the cartridge, and a means of controlling the discharge of the liquid content.

4.1.2 The container shall be designed for a minimum burst pressure of 500 p. s. i.

4.1.3 The Type I unit shall be fitted with an AN connection in accordance with AN-C-71, or equivalent, for pressurizing the unit. A pressure gage to indicate the stored pressure shall also be provided. The gage range shall be at least 100 pounds above the charged pressure of the unit at 70° F.

4.1.4 Type II units shall use as a pressurizing means a carbon dioxide filled cartridge made in accordance with Specification AN-C-105, or equivalent, but in addition suitably winterized to insure operation at -40° F. A means shall be provided to readily release the carbon dioxide from the cartridge immediately prior to the use of the units. The torque required to release the cartridge shall not exceed 25 inch-pounds. The cartridge holder shall be designed so that it cannot be assembled if the cartridge is in the wrong position. The cartridge holder shall be designed so that a simple visual inspection will indicate whether a cartridge is in the holder.

4.1.5 The extinguisher shall be provided with a valve which will control the liquid discharge. The extinguisher shall be designed so that after the unit has been placed in operation it shall be completely controllable with one hand, including starting, stopping and directing the discharge stream. The force to operate the valve shall not exceed 3 pounds if the lever type is used. If a rotary type is used the torque required shall not exceed 25 inch-pounds.

4.1.6 Type I units shall be designed so that the maximum stored pressure at 70° F. shall not exceed 175 psi. Type II units shall be designed so that the instantaneous pressure developed at 70° F. when the cartridge is released into a filled unit shall not exceed 200 psi.

4.1.7 The extinguisher shall be designed so that it cannot be overfilled with extinguishing medium.

4.1.8 The extinguisher shall be provided with a satisfactory seal to indicate tampering and/or operation.

4.2 *Liquid charge:*

4.2.1 The liquid used as the extinguishing medium shall be as free from corrosive effects as practicable.

4.2.2 The fire extinguishing liquid shall be non-toxic and non-injurious to personnel and shall not form injurious toxic fumes when discharged on a fire.

4.2.3 The fire extinguishing liquid shall not deteriorate or lose its efficiency over a one-year period.

4.2.4 The fire extinguishing liquid shall have extinguishing qualities equal to or

better than an equal quantity of water when used at 70° F.

4.2.5 A wetting agent may be used provided the resulting solution complies with all requirements of the specification.

4.3 Discharge characteristics:

4.3.1 At 70° F. the time of effective discharge for a full extinguisher shall be not less than 30 nor more than 45 seconds.

4.3.2 At 70° F., with the extinguisher nozzle approximately 4 feet above the floor, it shall throw a stream a horizontal distance of not less than 20 feet and maintain this range for at least three-quarters of the contents.

4.3.3 The extinguisher at 70° F. shall be capable of discharging three-quarters of its contents by directing the stream in any desired direction.

4.4 Bracket.

4.4.1 A bracket shall be furnished from which the extinguisher can be quickly and easily removed. The bracket shall be designed to hold the charged extinguisher against an acceleration force of 10 g. applied in any direction.

5. Individual performance requirements. All extinguishers, or components of same, shall be subjected to whatever tests the manufacturer deems necessary to demonstrate specific compliance with this specification, including the following requirements:

5.1 Hydrostatic tests. Each container shall be hydrostatically tested to 250 psi for a one minute period and shall show no leakage or detriment effects.

6. Qualification tests. As many extinguishers as deemed necessary by the manufacturer to demonstrate that all extinguishers will comply with the requirements of this section shall be tested. The tests of each extinguisher shall be conducted consecutively and after the tests have been initiated, no servicing (except recharging and repressurizing) or adjustments shall be permitted. For both types of extinguishers, these tests shall be conducted with a fully charged unit. The Type I units shall be pressurized to the recommended pressure at 70° F. The Type II units shall have the cartridge inserted in the holders.

6.1 High temperatures. The extinguisher shall be subjected to a temperature of 140° F. for a period of 6 hours and then discharged. The discharge characteristics shall not vary more than 25 percent from the figures in section 4.3.

6.2 Low temperature. The extinguisher shall be subjected to a temperature of -40° F. for a period of 6 hours and then discharged. The discharge characteristics shall not vary more than 40 percent from the figures in section 4.3.

6.3 Vibration. The extinguisher shall be placed in its bracket which shall be attached to a vibration stand. The vibration tests shall be conducted at 2,400 cycles per minute with a total excursion of $\frac{1}{2}$ inch and at 3,000 cycles per minute with a total excursion of 0.015 inch. The assembly shall be vibrated for a three hour period with its major axis vertical and for a similar period with its major axis horizontal. At the completion of the vibration tests, the extinguisher and bracket shall be examined to determine that no looseness in the units nor damage to a part has resulted. The extinguisher shall be discharged to determine compliance with the discharge characteristics of section 4.3.

6.4 Fire tests. The extinguishing medium shall be tested to determine compliance with the requirements of section 4.2.4.

(2) Application. (i) When portable fire extinguishers are required by this subchapter, water-solution type fire extinguishers complying with the specifications appearing in this Technical Standard Order are hereby approved for use in the compartments aft of the pilot compartment(s) in all civil aircraft

in applications wherein the hazard is greatest from Class A fires (involving paper, textiles, and similar combustible materials). When substitution of portable water-solution type fire extinguishers for other types is contemplated for Class A fire protection, it shall be on a basis of one minimum 1½-quart water-solution type fire extinguisher for each 1 quart carbon tetrachloride or the 2-pound carbon dioxide-type extinguisher. Portable water-solution type fire extinguishers already approved by the Administrator may continue to be installed in aircraft:

(a) For which an application for original type certificate is made prior to the effective date of this order,

(b) The prototype of which is flown within one year after the effective date of this order, and

(c) The prototype of which is not flown within one year after the effective date of this order if due to causes beyond the applicant's control.

(ii) If an alteration involving a change in type or model of portable water-solution fire extinguisher is made within nine months after the effective date of this order, previously approved types of portable water-solution type fire extinguishers may be installed. However, in any such change made after the nine month period, new types of portable water-solution type fire extinguishers installed shall meet the specifications contained herein.

(c) Specific instructions—(1) Marking. In addition to the identification information required in the referenced specification, each portable water-solution type fire extinguisher shall be permanently marked with the Technical Standard Order designation, CAA-TSO-C19, to identify the extinguisher as meeting the requirements of this order in accordance with the manufacturers' statement of conformance outlined below. This identification will be accepted by the Civil Aeronautics Administration as evidence that the established minimum safety requirements for portable water-solution type fire extinguishers have been met.

(2) Data requirements. None.

(3) Effective date. After June 1, 1949, specifications contained in this order will constitute the basis for Civil Aeronautics Administration approval of portable water-solution type fire extinguishers for use in certificated aircraft.

(4) Deviations. Requests for deviation from, or waiver of, the requirements of this order, which affect the basic airworthiness of the component, should be submitted for approval by the Chief, Aircraft Service, Office of Aviation Safety, Civil Aeronautics Administration. These requests should be addressed to the nearest Regional Office of the Civil Aeronautics Administration, Attn: Superintendent, Aircraft Branch.

(5) Conformance. (i) The manufacturer shall furnish to the Civil Aeronautics Administration, Aircraft Service, Attn: A-298, Washington 25, D. C., a written statement of conformance signed by a responsible official of his company, setting forth that the portable water-solution type fire extinguisher to be produced by him meets the minimum safety requirements established in this order.

Immediately thereafter distribution of the extinguisher conforming with the terms of this order may be started and continued.

(ii) The prescribed identification on the portable water-solution type fire extinguisher does not relieve the aircraft manufacturer or owner of responsibility for the proper application of the extinguisher in his aircraft, nor waive any of the requirements concerning type certification of the aircraft in accordance with existing Civil Air Regulations.

(iii) If complaints of nonconformance with the requirements of this order are brought to the attention of the Civil Aeronautics Administration, and investigation indicates that such complaints are justified, the Administrator will take appropriate action to restrict the use of the product involved.

(iv) Copies of this Technical Standard Order and other Technical Standard Orders may be obtained from the Civil Aeronautics Administration, Aviation Information Staff, Washington 25, D. C. [Supp. 4, 14 F. R. 3196]

§ 4b.451 Pressure cabins. When pressurized compartments are provided for the occupants of the airplane, the requirements of this section shall be met.

(a) Strength. (1) All parts of the airplane subjected to loads from both pressure differential and flight strength conditions shall be designed for limit loads corresponding to the flight limit loads combined with pressure differential loads from zero up to the maximum relief valve setting. The external pressure distribution on the cabin in flight shall be taken into account.

(2) If landings are to be permitted with the cabin pressurized, loads from the landing conditions shall be combined with pressure differential loads from zero up to maximum to be permitted during landing.

(3) As a separate condition, all parts of the airplane affected by pressure differential loads shall be designed for limit pressure differential loads corresponding to 1.33 times the maximum relief valve setting. All other loads shall be omitted in this case.

(4) When a pressurized cabin is separated into two or more compartments by bulkheads or floors, the primary structure shall be designed to withstand the effects of sudden release of pressure in any compartment having external doors or windows. This condition shall be investigated for the failure of the largest opening in a compartment and inter-compartment venting may be accounted for when provided.

(b) Pressure supply. If cabin pressurization is to be used in lieu of the regular use of oxygen at altitude in complying with the operating requirements of Parts 40, 41, and 61 of this subchapter the pressure supply shall be capable of maintaining a cabin pressure corresponding to an altitude of not more than 10,000 feet in standard atmosphere when the airplane altitude is any value up to the maximum for which certification is desired.

(c) Pressure control. Pressure cabins shall be provided with at least the fol-

lowing valves, controls, and indicators for controlling cabin pressure:

(1) At least two pressure relief valves, one or both of which may be the normal regulating valve, which will automatically limit the positive pressure differential to a predetermined value at the maximum rate of flow delivered by the pressure source. The combined capacity of these valves shall be such that the failure of any one valve to operate would not cause an appreciable rise in the pressure differential. The pressure differential is considered positive when the internal pressure is greater than the external.

(2) At least two reversed pressure differential relief valves (or equivalent) which will automatically prevent a negative pressure differential greater than that which would damage the structure. One negative pressure relief valve may be used if it is of simple design.

(3) Means shall be provided by which the pressure differential can be rapidly equalized.

(4) A suitable automatic or manual regulator for controlling the intake and/or exhaust air flow by means of which required internal pressures and air flow rates can be maintained.

(5) Instruments at an appropriate crew station showing the pressure differential, the absolute pressure in the cabin, and the rate of change of the absolute pressure.

(6) Suitable warning indications shall be provided at the appropriate crew station, which will indicate when the safe or preset limits on pressure differential and absolute cabin pressure are exceeded.

(7) If the structure has not been designed for pressure differentials up to the maximum relief valve setting in combination with landing loads (see § 4b.451 (a) (2)) a suitable warning placard shall be provided at the appropriate crew station.

(d) Tests. (1) The complete pressure cabin, including doors and windows and valves, shall be tested as a pressure vessel for the pressure differential specified in § 4b.451 (a) (3).

(2) The following functional tests shall be performed up to the working pressures:

(i) Functional and capacity tests of the positive and negative pressure differential relief valves and the emergency release valve, simulating the condition of regulator valves closed.

(ii) Tests showing that all parts of the pressurization system would function properly under all possible conditions of pressure, temperature, and moisture up to the maximum altitude for which certification is desired.

(iii) Flight tests demonstrating the performance of the pressure supply, pressure and flow regulators, indicators, and warning signals in steady and stepped climbs and descents at rates corresponding to the maximum attainable without exceeding the operating limitations of the airplane, up to the maximum altitude for which certification is desired.

(iv) Tests showing that all doors and emergency exits operate properly after

flights listed in paragraph (d) (2) (iii) of this section.

§ 4b.456 *Reinforcement near propellers.* Surfaces near propeller tips shall have sufficient strength and stiffness to withstand the effects of the induced vibration and of ice thrown from the propeller. Windows shall not be located in this area unless shown capable of withstanding the most severe ice impact likely to occur.

MISCELLANEOUS

§ 4b.461 *Leveling marks.* Suitable reference marks shall be provided for use in leveling the airplane when making weight and balance determinations on the ground.

SUBPART E—POWER-PLANT INSTALLATION; RECIPROCATING ENGINES

GENERAL

§ 4b.466 *Components.* (a) The power plant installation shall be considered to include all components of the airplane which are necessary for its propulsion. It shall also be considered to include all components which affect the control of the major propulsive units or which affect their safety of operation between normal inspections or overhaul periods.

(b) All components of the power-plant installation shall be constructed, arranged, and installed in a manner that will assure their continued safe operation between normal inspections or overhaul periods. Accessibility shall be provided to permit such inspection and maintenance as is necessary to assure continued airworthiness.

(c) Electrical interconnections shall be provided to prevent the existence of differences of potential between major components of the power-plant installation and other portions of the airplane.

§ 4b.466-1 *Reverse-thrust propeller (CAA policies which apply to § 4b.466).* In applying § 4b.466 (b), the Administrator will approve, as providing adequate safety, only those reverse-thrust propeller installations which conform in all details with the following standards:

(a) Exceptional pilot skill shall not be required in taxiing or any condition in which reverse thrust is to be used.

(b) Recommended operating procedures and operating limitations and placards shall be established.

(c) Throttle movement shall be such that the motion is in the direction of the desired acceleration of the airplane.

(d) The airplane control characteristics shall be satisfactory with regard to control forces encountered, and buffeting shall not be such as to be likely to cause structural damage.

(e) The directional control shall be adequate using normal piloting skill.

(f) It shall be determined that no dangerous condition is encountered in the event of a sudden failure of one engine in any likely operating condition.

(g) The operating procedures and airplane configuration shall be such as to provide a reasonable safeguard against serious structural damage to parts of the airplane due to the reverse air flow.

(h) It shall be determined that the pilot's vision is not dangerously obscured under normal operating conditions on

dusty or wet runways and where light snow is on the runway.

(i) It shall be impossible to place the propellers in the reverse-thrust position until the airplane is on the ground, unless it is demonstrated that it is safe to reverse the propellers in any likely flight condition. Consideration shall be given to possible rebound of the airplane following initial contact, at which point propeller reversal has taken place.

(j) The mechanism actuating the propeller and controlling the engine shall maintain sufficient power to keep the engine running at an adequate speed to prevent engine stalling during or after the propeller reversing operation.

(k) It shall not be possible under any likely condition to cause excessive overspeed of the propeller during the propeller reversing operation.

(l) The propeller control arrangement shall be such as to provide adequate safeguards against inadvertent reversal of propellers.

(m) The engine cooling characteristics shall be satisfactory when operated within the operating limitations.

(n) If it is desired to certificate reverse thrust for use in taxiing only, it will be permissible to omit requirement of items 3 and 9, if the following are complied with: Deliberate action with intent to reverse the propellers is required; and placard in plain view of pilot must warn not to reverse the propellers in the air and to be used for taxiing only.

[12 F. R. 3438. Correction noted at 14 F. R. 37]

ENGINES AND PROPELLERS

ENGINES

§ 4b.471 *Engines.* Engines installed in certificated airplanes shall be of a type that has been certificated in accordance with the provisions of Part 13 of this subchapter.

§ 4b.472 *Engine isolation.* The engines shall be so isolated, each from the other, that the failure or malfunctioning of any engine, or any part of the power-plant installation serving any engine, will not prevent the safe operation of the remaining engine or engines.

§ 4b.473 *Control of engine rotation.* Means shall be provided for stopping and restarting the rotation of any engine individually in flight. All components provided for this purpose which are located on the engine side of the fire wall and might be exposed to fire, shall be of fire-resistant construction (see also § 4b.563).

PROPELLERS

§ 4b.474 *Type.* Propellers installed in certificated airplanes shall be of a type that has been certificated in accordance with the provisions of Part 14 of this subchapter.

§ 4b.475 *Propeller vibration.* The magnitude of the propeller blade vibration stresses under all normal conditions of operations shall be determined by actual measurement or by comparison with similar installations for which such measurements have been made. The vibration stresses thus determined shall not exceed values that have been dem-

onstrated to be safe for continuous operation.

§ 4b.476 Propeller pitch and speed limitations. (a) The propeller pitch and speed shall be limited to values that will assure safe operation under all normal conditions of operation and will assure compliance with the performance requirements specified in §§ 4b.91-4b.114.

(b) A propeller speed limiting means shall be provided at the governor. Such means shall be set to limit the maximum possible governed engine speed to a value not exceeding the maximum permissible revolutions per minute.

(c) The low pitch blade stop in the propeller shall be set or other means used to limit the low pitch position, so as not to exceed 103% of the maximum permissible propeller shaft revolutions per minute under the following conditions:

(1) Propeller blades at the low pitch limit and governor inoperative.

(2) Engine operating at take-off manifold pressure with the airplane stationary under standard atmospheric conditions.

§ 4b.477 Propeller clearance— (a) **Ground clearance.** (1) Seven inches (for airplanes equipped with nose wheel type landing gears) or 9 inches (for airplanes equipped with tail wheel type landing gears) with the landing gear statically deflected and the airplane in the level, normal take-off, or taxiing attitude, whichever is most critical.

(2) In addition to subparagraph (1) of this paragraph, there shall be positive clearance between the propeller and the ground when, with the airplane in the level take-off attitude, the critical tire is completely deflated and the corresponding landing gear strut is completely bottomed.

(b) **Water clearance.** A minimum clearance of 18 inches shall be provided unless compliance with § 4b.165 can be demonstrated.

(c) **Structural clearance.** (1) One inch radial clearance between the blade tips and the airplane structure, or whatever additional radial clearance is necessary to preclude harmful vibration of the propeller or airplane.

(2) One-half inch longitudinal clearance between the propeller blades or cuffs and stationary portions of the airplane. Adequate positive clearance shall be provided between other rotating portions of the propeller or spinner and stationary portions of the airplane.

§ 4b.478 Propeller de-icing provisions. Airplanes intended for operation under atmospheric conditions conducive to the formation of propeller ice shall be provided with means for the prevention and removal of such ice accumulations. If combustible fluid is used for propeller de-icing, the provisions of §§ 4b.651-4b.655 shall be complied with.

[Amdt. 04-0, 11 F. R. 71 as amended by Amdt. 04-1, 11 F. R. 11351]

FUEL SYSTEM

§ 4b.481 General. The fuel system shall be constructed and arranged in a manner to assure the provision of fuel to each engine at a flow rate and pressure which have been established for proper

engine functioning under all normal conditions of operation including all maneuvers for which the airplane is intended.

ARRANGEMENT

§ 4b.482 Fuel system arrangement. Fuel systems shall be so arranged that any one fuel pump cannot draw fuel from more than one tank at a time unless means are provided to prevent introducing air into the system.

§ 4b.483 Fuel system independence. The fuel system shall be arranged to permit operation in such a manner that the failure of any one component will not result in the irrecoverable loss of the power of more than one engine. A separate fuel tank need not be provided for each engine to show compliance with this requirement if the Administrator finds that the fuel system incorporates features which provide equivalent safety.

§ 4b.484 Pressure cross-feed arrangements. Pressure cross-feed lines shall not pass through portions of the airplane devoted to carrying personnel or cargo unless means are provided to permit the flight personnel to shut off the supply of fuel to these lines, or unless the lines are enclosed in a fuel- and fume-proof enclosure that is ventilated and drained to the exterior of the airplane. Such enclosures need not be used if these lines incorporate no fittings on or within the personnel or cargo areas and are suitably routed or protected to safeguard against accidental damage. Lines which can be isolated from the remainder of the fuel system by means of valves at each end shall incorporate provisions for the relief of excessive pressures that may result from exposure of the isolated line to high ambient temperatures.

OPERATION

§ 4b.491 Fuel flow rate. (a) The ability of the fuel system to provide the required fuel flow rate shall be demonstrated when the airplane is in the attitude which represents the most adverse condition from the standpoint of fuel feed which the airplane is designed to attain. At least the following shall be considered in this regard:

(1) The normal ground attitude.

(2) Climb with take-off flaps (landing weight) and gear up, using take-off power, at speed V_2 , as determined in § 4b.95 (b), at landing weight.

(3) Level flight at maximum continuous power or the power required for level flight at V_c , whichever is less.

(4) The attitude of glide at a speed of $1.3 V_{so}$.

(b) During this test, fuel shall be delivered to the engine at a pressure not less than the minimum established for proper engine operation. The quantity of fuel in the tank being tested shall not exceed the amount established as the unusable fuel supply for that tank (as determined by demonstration of compliance with the provisions of § 4b.494, (see also §§ 4b.501 and 4b.713) plus whatever minimum quantity of fuel it may be necessary to add for the purpose of conducting the flow test. If a fuel flowmeter is provided, the meter shall be blocked during the flow test and the fuel shall flow through the meter bypass.

§ 4b.492 Fuel flow rate for pump systems. The fuel flow rate for pump systems (main and reserve supply) shall be 0.9 pound per hour for each take-off horsepower or 125% of the actual take-off fuel consumption of the engine, whichever is greater. This flow rate shall be applicable to both the primary engine-driven pump and to emergency pumps and shall be available when the pump is running at the speed at which it would normally be operating during take-off. In the case of hand-operated pumps, this speed shall be considered to be not more than 60 complete cycles (120 single strokes) per minute.

§ 4b.493 Fuel flow rate for transfer systems. The provisions of § 4b.492 shall also apply to transfer systems with the exception that the required fuel flow rate for the engine or engines involved shall be established upon the basis of maximum continuous power and speed instead of take-off power and speed.

§ 4b.494 Determination of unusable fuel supply and fuel system operation on low fuel. (a) The unusable fuel supply for each tank, used for take-off and landing, shall be established as not less than the quantity at which the first evidence of malfunctioning occurs under conditions specified below. (See § 4b.501.) Upon presentation of the airplane for test, the applicant shall stipulate the quantity of fuel with which he wishes to demonstrate compliance with this provision and shall also indicate which of the following conditions is most likely to be critical from the standpoint of establishing the unusable fuel supply. He shall also indicate the order in which the other conditions may be critical from this standpoint.

(1) Level flight at maximum continuous power or the power required for level flight at V_c , whichever is less.

(2) Climb with take-off flaps (landing weight) and gear up, using take-off power at speed V_2 , as determined in § 4b.95 (b), at landing weight.

(3) Rapid application of maximum continuous power and subsequent transition to climb at speed V_2 as in subparagraph (2) of this paragraph, with retraction of flaps and gear from a power-off glide at $1.3 V_{so}$ with flaps and gear down, at minimum weight with sufficient fuel for demonstration.

(b) If an engine can be supplied with fuel from more than one tank, it shall be possible to regain the full fuel pressure of that engine in not more than 20 seconds after switching to any full tank after engine malfunctioning becomes apparent due to the depletion of the fuel supply in any tank from which the engine can be fed. Compliance with this paragraph shall be demonstrated in level flight.

(c) The unusable fuel supply for all tanks other than those used for take-off and landing shall be established as not less than the quantity at which the first evidence of malfunctioning occurs under the conditions specified in paragraph (a) (1) of this section. This may be a ground test.

§ 4b.495 Fuel system hot weather operation. There shall be no evidence of vapor lock or other malfunctioning

when the airplane is operated with fuel at a temperature of not less than 110° F. and is climbed, at a climb speed not to exceed that which will permit compliance with the climb requirement specified in § 4b.102, to the altitude at which the one-engine-inoperative best rate of climb, expressed in feet per minute, is not more than $0.02 V_{so}^2$ for airplanes with a maximum take-off weight of 40,000 lbs. or less, $0.04 V_{so}^2$ for airplanes with a maximum take-off weight of 60,000 lbs. or more with a linear variation between 40,000 lbs. and 60,000 lbs. when climbing at the weight corresponding to operation with full fuel tanks, minimum crew, and only that ballast which may be necessary to maintain the center of gravity limits for which the airplane is to be certificated. Demonstration of compliance with this section shall be accomplished either in flight or by means of a ground installation which closely simulates conditions in flight. In case of a flight demonstration conducted in cold weather, the Administrator may request that fuel tank surfaces, fuel lines, and other fuel system parts which may be subjected to cooling action from cold air, be suitably insulated to simulate, insofar as practicable, flight in hot weather.

§ 4b.496 *Flow between interconnected tanks.* In the case of systems with tanks whose outlets are interconnected, it shall not be possible for fuel to flow between tanks in quantities sufficient to cause an overflow of fuel from the tank vent when the airplane is operated as specified in § 4b.494 (a) and the tanks are full.

FUEL TANKS

§ 4b.501 *General.* Fuel tanks shall be capable of withstanding without failure any vibration, inertia, fluid, and structural loads to which they may be subjected in operation. Flexible fuel tank liners shall be of an acceptable type or proven suitable for the particular application. The fuel tanks, as installed, shall be designed to withstand a minimum internal pressure of 3.5 pounds per square inch. Integral type fuel tanks shall be provided with adequate facilities for the inspection and repair of the tank interior. The total usable capacity of the fuel tanks shall not be less than 0.15 gallon for each maximum continuous horsepower for which the airplane is certificated. The unusable capacity shall be considered to be the minimum quantity of fuel that will permit compliance with the provisions of § 4b.494. The fuel quantity gauge shall be adjusted to account for the unusable fuel supply as specified in § 4b.713. The weight of the unusable fuel supply shall be included in the empty weight of the airplane.

§ 4b.502 *Fuel tank tests.* (a) Fuel tanks shall be capable of withstanding the following pressure tests without failure or leakage. These pressures may be applied in a manner simulating the actual pressure distribution in service.

(1) Conventional metal tanks and nonmetallic tanks whose walls are not supported by the airplane structure: A pressure of 3.5 pounds per square inch, or the pressure developed during the

maximum ultimate acceleration of the airplane with a full tank, whichever is greater.

(2) Integral tanks: A minimum pressure of 3.5 pounds per square inch shall be used unless the pressure developed during the maximum limit acceleration of the airplane with a full tank exceeds this amount, in which case a hydrostatic head, or equivalent test, shall be applied to duplicate the acceleration loads insofar as possible, but need not exceed 3.5 pounds per square inch on surfaces not exposed to the acceleration loading.

(3) Nonmetallic tanks whose walls are supported by airplane structure shall be tested to a pressure of 3.5 pounds per square inch when mounted in the airplane structure.

(b) Tanks with large unsupported or unstiffened flat areas shall be capable of withstanding the following tests, or other suitable tests, without leakage or failure. The complete tank assembly, together with its supports, shall be subjected to a vibration test when mounted in a manner simulating the actual installation. The tank assembly shall be vibrated for 25 hours at an amplitude of not less than $\frac{1}{32}$ of an inch while filled two-thirds full of water. The frequency of vibration shall be 90% of the maximum continuous rated speed of the engine unless some other frequency within the normal operating range of speeds of the engine is more critical, in which case the latter speed shall be employed and the time of test shall be adjusted to accomplish the same number of vibration cycles. In conjunction with the vibration test, the tank assembly shall be rocked through an angle of 15° on either side of the horizontal (30° total) about an axis parallel to the axis of the fuselage. The assembly shall be rocked at the rate of 16 to 20 complete cycles per minute.

(c) In case of tanks with nonmetallic liners, a specimen liner of the same basic construction as that to be used in the airplane shall, when installed in a suitable representative test tank, satisfactorily withstand the slosh test in paragraph (b) of this section with fuel at a temperature of 110° F.

§ 4b.503 *Fuel tank installation.* (a) The method of support for fuel tanks shall not be such as to concentrate loads on unsupported tank surfaces resulting from the weight of the fuel in the tank. Pads shall be provided to prevent chafing between the tank and its supports. Materials employed for padding shall be nonabsorbent or shall be treated to prevent the absorption of fluids. If flexible tank liners are employed, they shall be so supported that the liner is not required to withstand fluid loads. Interior surfaces of compartments for such liners shall be smooth and free of projections which may cause wear of the liner unless provisions are made for protection of the liner at such points or unless the construction of the liner itself provides such protection.

(b) Spaces adjacent to the surfaces of the tank shall be ventilated consistent with the size of the compartment to avoid fume accumulation in the case of minor leakage, or if the tank is in a sealed com-

partment the ventilation may be limited to that provided by drain holes of sufficient size to prevent excessive pressure resulting from altitude changes.

(c) Location of fuel tanks shall comply with the provisions of § 4b.652. In addition, no portion of engine nacelle skin which lies immediately behind a major air egress opening from the engine compartment shall act as the wall of an integral tank. Fuel tanks shall be isolated from personnel compartments by means of fume- and fuel-proof enclosures.

[Amdt. 04-0, 11 F. R. 71, as amended by Amdt. 04-1, 11 F. R. 11351]

§ 4b.504 *Fuel tank expansion space.* Fuel tanks shall be provided with an expansion space of not less than 2% of the tank capacity. It shall not be possible inadvertently to fill the fuel tank expansion space when the airplane is in the normal ground attitude.

§ 4b.505 *Fuel tank sump.* (a) Each tank shall be provided with a sump having a capacity of not less than either 0.25% of the tank capacity or $\frac{1}{16}$ of a gallon, whichever is greater.

(b) The fuel tank sump capacity specified above shall be effective with the airplane in the normal ground attitude. The fuel tank shall be constructed to permit drainage of any hazardous quantity of water from all portions of the tank to the sump when the airplane is in the ground attitude.

(c) Fuel tank sumps shall be provided with a drain to permit complete drainage of the sump on the ground. The drain shall discharge clear of all portions of the airplane and shall be provided with means for positively or automatically locking the drain in the closed position. The drain shall be readily accessible.

(d) An additional drain may be provided, if necessary, for tank drainage.

§ 4b.506 *Fuel tank filler connection.* The fuel tank filler connections shall be marked as specified in § 4b.902. Provision shall be made to prevent the entrance of fuel into the fuel tank compartment or any portions of the airplane other than the tank itself. Recessed fuel filler connections which retain any appreciable quantity of fuel shall be drained and the drain shall discharge clear of all portions of the airplane. The filler cap shall provide a fuel-tight seal.

§ 4b.507 *Fuel tank vents and carburetor vapor vents.* (a) Fuel tanks shall be vented from the top portion of the expansion space in such a manner that the tank is adequately vented under all normal flight conditions. Vent outlets shall be so located and constructed as to prevent the possibility of their being obstructed by ice or other foreign matter. The vent shall be so constructed as to preclude the possibility of siphoning fuel during normal operation. The vent shall be of sufficient size to permit the rapid relief of excessive differences of pressure between the interior and exterior of the tank. Air spaces of tanks whose outlets are interconnected shall also be interconnected. There shall be no points in the vent line where moisture may accumulate with the airplane in either the ground or level flight attitude unless

proper drainage is provided. Vents and drainage shall not terminate at points where the discharge of fuel from the vent outlet will constitute a fire hazard or from which fumes may enter personnel compartments.

(b) Carburetors which are provided with vapor elimination connections shall be provided with a vent line which will lead vapors back to one of the fuel tanks. Satisfactory provisions shall be incorporated in the vent system to avoid stoppage by ice. If more than one fuel tank is provided and it is necessary to use the tanks in a definite sequence for any reason, the vapor vent return line shall lead back to the fuel tank used for take-off and landing.

§ 4b.508 *Fuel tank outlet.* The fuel tank outlet shall be provided with a strainer of from 8 to 12 meshes per inch, or a suitable strainer on the booster pump. The clear area of the fuel tank outlet strainer shall not be less than 5 times the area of the fuel tank outlet line. The diameter of the strainer shall not be less than the diameter of the fuel tank outlet. Finger strainers shall be installed in a manner to be accessible for inspection and cleaning.

FUEL PUMPS

§ 4b.511 *Fuel pump and pump installation.* (a) If fuel pumps are provided to maintain a supply of fuel to the engine, at least one pump for each engine shall be driven by the engine. Fuel pumps shall be adequate to meet the flow requirements of the applicable portions of §§ 4b.491-4b.493. Provision shall be made to maintain the fuel pressure at the inlet to the carburetor within the range of limits established for proper engine operation. When necessary for the maintenance of the proper fuel de-§§ 4b.491-4b.493. Provision shall be provided to transmit the carburetor air intake static pressure to the proper fuel pump relief valve connection. In such cases, to avoid erroneous fuel pressure reading, the gauge balance lines should be independently connected to the carburetor inlet pressure.

(b) Unless equivalent provisions are made to permit the system to continue to supply fuel to all engines in case of the failure of any positive displacement fuel system pump, the pump itself shall incorporate an integral bypass. Engine fuel injection pumps which are certificated as an integral part of the engine need not incorporate a bypass.

(c) Emergency fuel pumps shall be provided to permit supplying all engines with fuel in case of the failure of any one fuel system pump, unless the engine-driven pump has been approved with the engine and suitable precautions are taken to avoid vapor lock and pump cavitation. If the only pump used in the system is an engine fuel injection pump which has been certificated as an integral part of the engine, an emergency pump need not be provided. Emergency pumps shall be capable of complying with the same flow requirements as are prescribed for the main pumps. Hand emergency pumps shall not require excessive effort for their continued operation at the rate of 60 complete cycles (120 single strokes) per minute. Emergency pumps shall be

available for immediate use in case of the failure of any other pump.

(d) If the engine-driven pumps are capable of maintaining flight up to 10,000 feet altitude and with 110° F. fuel without the aid of auxiliary pumps, the auxiliary pumps may be considered as emergency pumps.

LINES AND FITTINGS

§ 4b.516 *Fuel system lines and fittings.* Fuel lines shall be installed and supported in a manner that will prevent excessive vibration and will be adequate to withstand loads due to fuel pressure and accelerated flight conditions. Lines which are connected to components of the airplane between which relative motion may exist shall incorporate provisions for flexibility. Flexible connections in lines which may be under pressure and subjected to axial loading shall employ flexible hose assemblies rather than hose clamp connections. Flexible hose shall be of an acceptable type or proven suitable for the particular application.

§ 4b.517 *Lines and fittings in designated fire zones.* Fuel lines and fittings in all designated fire zones (see § 4b.651) shall comply with the provisions of § 4b.654.

[Amdt. 04-1, 11 F. R. 11351]

§ 4b.518 *Fuel valves.* In addition to the requirements contained in § 4b.653 for shut-off means, all fuel valves shall be provided with positive stops or suitable index provisions in the "on" and "off" positions and shall be supported in such a manner that loads resulting from their operation or from accelerated flight conditions are not transmitted to the lines connected to the valve.

[Amdt. 04-1, 11 F. R. 11351]

§ 4b.519 *Fuel strainer.* A fuel strainer shall be provided between the fuel tank outlet and the carburetor inlet. If an engine driven fuel pump is provided, the strainer shall be located between the tank outlet and the engine driven pump inlet. The strainer shall be accessible for drainage and cleaning, and the strainer screen shall be easily removable. The strainer shall be mounted in a manner that does not cause its weight to be supported by the connecting lines or by the inlet or outlet connections of the strainer itself.

DRAINS AND INSTRUMENTS

§ 4b.526 *Fuel system drains.* Drainage of the system shall be accomplished by fuel strainer drains and other drains as provided in § 4b.505. Drains shall discharge clear of all portions of the airplane and shall be provided with means for positively or automatically locking the drain in the closed position. All fuel system drains shall be accessible. If drainage of the strainer permits compliance with the foregoing, no additional drains need be provided unless a hazardous quantity of water or sediment may be trapped. (See also § 4b.655.)

[Amdt. 04-0, 11 F. R. 71, as amended by Amdt. 04-1, 11 F. R. 11351]

§ 4b.531 *Fuel system instruments.* See § 4b.691 (b) and §§ 4b.711-4b.713.

FUEL JETTISONING SYSTEM

§ 4b.536 *Fuel jettisoning system.* (a) If the maximum take-off weight for which the airplane is certificated exceeds 105% of its maximum landing weight, provision shall be made to permit the jettisoning of fuel from the maximum take-off to the maximum landing weight at a rate per minute of 1% of the maximum take-off weight, when the airplane is flown in the configurations specified below, except that the time required to jettison the fuel need not in any case be less than 10 minutes. The fuel jettisoning system shall permit the safe discharge of fuel clear of all portions of the airplane under the following conditions of flight at the maximum take-off weight and with flaps and gear up:

(1) Power-off glide at a speed of $1.4 V_{S1}$.

(2) Climb at the one-engine-inoperative speed with the critical engines on one side of the airplane inoperative, the other engines at maximum continuous power.

(3) Level flight at a speed of $1.4 V_{S1}$, if found necessary from tests in subparagraphs (1) and (2) of this paragraph.

(b) Unless it is demonstrated that flap position does not adversely affect fuel jettisoning, a placard shall be provided adjacent to the jettisoning control to warn flight personnel against jettisoning fuel while the flaps are lowered. A notation to this effect shall also be included in the airplane operating manual.

(c) No fire hazard shall exist during, or as the result of, the jettisoning operation. Neither fumes nor fuel shall enter any portion of the airplane and the jettisoning operation shall not adversely affect control. Compliance with these provisions shall be demonstrated in flight. It shall not be possible to jettison fuel in the tanks used for take-off and landing below the level providing 45 minutes flight at 75% maximum continuous power, except that all fuel may be jettisoned where an auxiliary control is provided independent of the main jettisoning control.

(d) The fuel jettisoning valve shall be so constructed as to permit the flight personnel to close the valve during any portion of the jettisoning operation. (See § 4b.638 for fuel jettisoning system controls.)

OIL SYSTEM

§ 4b.541 *General.* Each engine shall be provided with an independent oil system capable of supplying the engine with an ample quantity of oil at a temperature not exceeding the maximum which has been established as safe for continuous operation. The oil capacity of the system shall not be less than 1 gallon for every 30 gallons of fuel capacity unless provisions are made for transferring oil between tanks in flight or unless a reserve oil supply, which can be fed to any tank during flight, is provided. If either a reserve oil system or an oil transfer system is provided, the total oil capacity need not exceed 1 gallon for each 40 gallons of fuel capacity. Lower oil-fuel ratios may be used providing they can be substantiated by oil consumption data.

§ 4b.542 *Oil cooling.* Demonstration of the ability of the oil cooling provisions to maintain the oil inlet temperature to the engine at or below the maximum established value shall be accomplished in accordance with §§ 4b.576-4b.582.

OIL TANKS

§ 4b.546 *General.* Oil tanks shall be capable of withstanding without failure all vibration, inertia, and fluid loads to which they may be subjected in operation. Flexible oil tank liners shall be of an acceptable type or proven suitable for the particular application.

§ 4b.547 *Oil tank tests.* Oil tank tests shall be the same as fuel tank tests (see § 4b.502) except as follows:

(a) The $3\frac{1}{2}$ pounds per square inch pressure specified in § 4b.502 shall be 5 pounds per square inch.

(b) In the case of tanks with nonmetallic liners, the test fluid shall be oil at a temperature of 250° F. rather than fuel as specified in § 4b.502 (c).

§ 4b.548 *Oil tank installation.* Oil tank installations shall comply with the provisions of § 4b.503 except that oil tanks may be located on the engine side of the fire wall.

§ 4b.549 *Oil tank expansion space.* Oil tanks shall be provided with an expansion space of not less than either 10% of the tank capacity or 0.5 gallon, whichever is greater. Reserve oil tanks which have no direct connection to any engine shall be provided with an expansion space which need not exceed, but shall not be less than, 2% of the tank capacity. It shall not be possible inadvertently to fill the oil tank expansion space when the airplane is in the normal ground attitude.

§ 4b.550 *Oil tank filler connection.* Oil tank filler connections shall be marked as specified in § 4b.902. Recessed oil filler openings which retain any appreciable quantity of oil shall be drained and the drain shall discharge clear of all portions of the airplane. The filler cap shall provide an oil-tight seal.

§ 4b.551 *Oil tank vent.* Oil tanks shall be vented from the top portion of the expansion space in such a manner that the tank is adequately vented under all normal flight conditions. Oil tank vents shall be so arranged that condensed water vapor that may freeze and obstruct the line cannot accumulate at any point. (See also § 4b.655.)

[Amdt. 04-0, 11 F. R. 71, as amended by Amdt. 04-1, 11 F. R. 11351]

§ 4b.552 *Oil tank outlet.* The oil tank outlet shall not be enclosed or covered by any screen or other guard that may impede the flow of oil. (See also § 4b.563.)

LINES, FITTINGS, AND ACCESSORIES

§ 4b.555 *Oil system lines and fittings.* Oil lines shall comply with the provisions of § 4b.516.

§ 4b.556 *Lines and fittings in designated fire zones.* Oil lines and fittings in all designated fire zones (see § 4b.651) shall comply with the provisions of § 4b.654.

[Amdt. 04-1, 11 F. R. 11351]

§ 4b.557 *Oil valves.* (a) Requirements of § 4b.653 for shut-off means shall be complied with. Closing of oil shut-off means shall not prevent feathering the propeller, unless equivalent safety provisions are incorporated.

(b) All oil valves shall be provided with positive stops or suitable index provisions in the "on" and "off" positions, and shall be supported in such a manner that loads resulting from their operation or from accelerated flight conditions are not transmitted to the lines attached to the valve.

[Amdt. 04-1, 11 F. R. 11351]

§ 4b.558 *Oil radiator.* (a) Oil radiators shall be capable of withstanding without failure any vibration, inertia, and oil pressure loads to which they may normally be subjected.

(b) Oil radiator air ducts shall be so located that flames issuing from normal openings of the engine nacelle in case of fire shall not impinge directly upon the radiator.

§ 4b.559 *Oil filters.* If the airplane is equipped with an oil filter, the filter shall be constructed or installed in such a manner that complete blocking of the flow through the filter element will not prevent the safe operation of the engine oil supply system.

§ 4b.560 *Oil system drains.* Accessible drains shall be provided to permit safe drainage of the entire oil system and shall incorporate means for positive or automatic locking in the closed position. (See also § 4b.655.)

[Amdt. 04-0, 11 F. R. 71, as amended by Amdt. 04-1, 11 F. R. 11351]

§ 4b.561 *Engine breather line.* Engine breather lines shall be so arranged that condensed water vapor which may freeze and obstruct the line cannot accumulate at any point. Breathers shall discharge in a location which will not constitute a fire hazard in case foaming occurs and so that oil emitted from the line will not impinge upon the pilots' windshield. The breather shall not discharge into the engine air induction system. (See also § 4b.655.)

[Amdt. 04-0, 11 F. R. 71, as amended by Amdt. 04-1, 11 F. R. 11351]

INSTRUMENTS

§ 4b.562 *Oil system instruments.* See §§ 4b.691, 4b.711, 4b.712, and 4b.715.

§ 4b.563 *Propeller feathering system.* If the propeller feathering system is dependent upon the use of the engine oil supply, provision shall be made to trap a quantity of oil in the tank in case the supply becomes depleted due to failure of any portion of the lubricating system other than the tank itself. The quantity of oil so trapped shall be sufficient to accomplish the feathering operation and shall be available only to the feathering pump. The ability of the system to accomplish feathering when the supply of oil has fallen to the above level shall be demonstrated. This propeller feathering demonstration may be made on the ground if desired.

COOLING

§ 4b.571 *General.* The power-plant cooling provisions shall be capable of

maintaining the temperatures of major power-plant components, engine fluids, and the carburetor intake air within the established safe values under all conditions of ground and flight operation.

TESTS

§ 4b.576 *Cooling tests.* Compliance with the provisions of § 4b.571 shall be demonstrated under critical ground, water, and flight operating conditions. If the tests are conducted under conditions that deviate from the highest anticipated summer air temperature (see § 4b.577), the recorded power-plant temperatures shall be corrected in accordance with the provisions of §§ 4b.578 and 4b.579. The corrected temperatures determined in this manner shall not exceed the maximum established safe values. The fuel used during the cooling tests shall be of the minimum octane number approved for the engines involved and the mixture settings shall be those used in normal operation. The test procedures shall be as outlined in §§ 4b.580-4b.582.

§ 4b.577 *Maximum anticipated summer air temperatures.* The maximum anticipated summer air temperature (hot-day condition) shall be considered to be 100° F. at sea level and to decrease from this value at the rate of 3.6° F. per thousand feet of altitude above sea level until a temperature of -67° is reached, above which altitude the temperature will be held constant at -67° F.

§ 4b.578 *Correction factor for cylinder head, oil inlet, carburetor air, and engine coolant outlet temperatures.* These temperatures shall be corrected by adding the difference between the maximum anticipated summer air temperature and the temperature of the ambient air at the time of the first occurrence of maximum head, air, oil, or coolant temperature recorded during the cooling test. A correction factor other than 1.0 may be employed if it can be demonstrated to be applicable.

§ 4b.579 *Correction factors for cylinder barrel temperatures.* Cylinder barrel temperatures shall be corrected by adding 0.7 of the difference between the maximum anticipated summer air temperature and the temperature of the ambient air at the time of the first occurrence of the maximum cylinder barrel temperature recorded during the cooling test. A correction factor other than 0.7 may be employed if it can be demonstrated to be applicable.

§ 4b.580 *Climb cooling test procedure.* (a) The climb cooling test shall be conducted with the critical engine inoperative and its corresponding propeller feathered. All remaining engines shall be operated at their maximum continuous power or at full throttle when above the critical altitude. After stabilizing temperatures in flight, the climb shall be started at or below the lower of the two following altitudes and shall be continued until at least 5 minutes after the occurrence of the highest temperature recorded:

(1) 1,000 feet below the engine critical altitude.

(2) 1,000 feet below the altitude at which the rate of climb, as established in § 4b.103 (b), at the maximum take-off

weight, is equal to at least $0.02 V_{st}^2$ for airplanes with a maximum take-off weight of 40,000 lbs. or less, $0.04 V_{st}^2$ for airplanes with a maximum take-off weight of 60,000 lbs. or more, with a linear variation between 40,000 lbs. and 60,000 lbs.

(b) The climb shall be conducted at an air speed which does not exceed the speed used in establishing the rate of climb required in § 4b.103 (b). The climb cooling test may be conducted as a continuation of the take-off cooling test of § 4b.581.

§ 4b.581 *Take-off cooling test procedure.* If the time for which take-off power is used in establishing the take-off path of the airplane exceeds 2 minutes, the test of § 4b.580 shall be supplemented by demonstration of adequate cooling during take-off and subsequent climb with one engine inoperative. The take-off cooling test shall be conducted by stabilizing temperatures during level flight at 75% of maximum continuous power (all engines operating) with normal cowl flap and shutter settings for the conditions. After all temperatures have stabilized, the climb shall be started at the lowest practicable altitude and shall be conducted with one engine inoperative and the corresponding propeller feathered. The remaining engines shall be operated at take-off revolutions per minute and power (or full throttle when above the take-off critical altitude) for the same time interval as take-off power is used during determination of the take-off flight path (see § 4b.97). The power shall then be reduced to the maximum continuous power and the climb continued until at least 5 minutes after the occurrence of the highest temperature recorded. The speed used during take-off power operation shall not exceed the speed used during the determination of the take-off flight path.

§ 4b.582 *Cooling test procedure for flying boat water operation.* In the case of flying boats, adequate cooling shall be demonstrated during taxiing downwind for 10 minutes at 5 miles per hour above the step speed.

LIQUID COOLING

§ 4b.586 *Independent systems.* (a) Each liquid cooled engine shall be provided with an independent cooling system. The coolant system shall be so arranged that no air or vapor can be trapped in any portion of the system other than the expansion tank, either during filling or during operation.

(b) No inflammable coolant shall be used.

[Amdt. 04-0, 11 F. R. 71, as amended by Amdt. 04-1, 11 F. R. 11351]

§ 4b.587 *Coolant tank.* A coolant tank shall be provided. The tank shall have a usable coolant capacity of not less than 1 gallon. Coolant tanks shall be capable of withstanding without failure all vibration, inertia, and fluid loads to which they may be subjected in operation. Coolant tanks shall be provided with an expansion space of not less than 10% of the total coolant system capacity. It shall not be possible inadvertently to

fill the expansion space with the airplane in the normal ground attitude.

§ 4b.588 *Coolant tank tests.* Coolant tank tests shall be the same as fuel tank tests (see § 4b.502) except as follows:

(a) The 3.5 pounds per square inch pressure test of § 4b.502 (a) shall be replaced by either the sum of the pressure developed during the maximum ultimate acceleration with a full tank plus the maximum working pressure of the system, or 1.25 times the maximum working pressure of the system, whichever is greater.

(b) In the case of tanks with nonmetallic liners, the test fluid shall be coolant at operation temperature rather than fuel as specified in § 4b.502 (c).

§ 4b.589 *Coolant tank installation.* Coolant tanks shall be supported in such a manner that the tank loads will be distributed over a large portion of the tank surface. Pads shall be provided to prevent chafing between the tank and the support. Material used for padding shall be nonabsorbent or shall be treated to prevent the absorption of inflammable fluids.

§ 4b.590 *Coolant tank filler connection.* Coolant tank filler connections shall be marked as specified in § 4b.902. Recessed coolant filler connections which retain any appreciable quantity of coolant shall be drained and the drain shall discharge clear of all portions of the airplane.

§ 4b.591 *Coolant lines and fittings.* Coolant lines shall comply with the provisions of § 4b.516.

§ 4b.592 *Fire-resistant coolant lines and fittings.* If the coolant used will ignite and burn under the conditions of power-plant fires, all lines and fittings located within designated fire zones shall comply with the provisions of § 4b.654.

[Amdt. 04-1, 11 F. R. 11351]

§ 4b.592-1 *Fire-resistant aircraft material (CAA rules which apply to § 4b.592).* See §§ 4b.448-1, 4b.448-2, 4b.448-3.

[13 F. R. 7729]

§ 4b.593 *Coolant radiators.* Coolant radiators shall be capable of withstanding without failure any vibration, inertia, and coolant pressure loads to which they may be normally subjected. Radiators shall be supported in a manner that will permit expansion due to operating temperatures and that will prevent the transmittal of harmful vibration to the radiator. If the coolant employed is inflammable the air intake duct to the coolant radiator shall be so located that flames issuing from normal openings of the engine nacelle, in case of fire, shall not impinge directly upon the radiator.

§ 4b.594 *Coolant system drains.* One or more drains shall be provided to permit drainage of the entire coolant system, including the coolant tank, radiator, and the engine when the airplane is in the normal ground attitude. Drains shall discharge clear of all portions of the airplane and shall be provided with means for positively locking the drain in

the closed position. Coolant system drains shall be accessible.

§ 4b.595 *Coolant system instruments.* See §§ 4b.691, 4b.711, 4b.712, and 4b.715.

INDUCTION SYSTEM

§ 4b.601 *General.* The engine air induction system shall permit supplying an adequate quantity of air to the engine under all conditions of operation. The induction system shall provide air in such a manner as to permit acceptable fuel metering and mixture distribution with the induction system valves in any position. Each engine shall be provided with an alternate air source unless equivalent safety can be demonstrated by other means. Air intakes may open within the cowling only if that portion of the cowling is isolated from the engine accessory section by means of a fire-resistant diaphragm, or if provision is made to prevent the emergence of backfire flames. Alternate air intakes shall be located in a sheltered position.

§ 4b.602 *Induction system de-icing and anti-icing provisions.* The engine air induction system shall incorporate means for the prevention and elimination of ice accumulations in accordance with the following provisions unless it can be demonstrated that equivalent safety can be obtained by a lower heat rise or by other means. It shall be demonstrated that compliance with the provisions outlined in the paragraphs (a) and (b) of this section can be accomplished when the airplane is operating in air at a temperature of 30° F. when the air is free of visible moisture.

(a) Airplanes equipped with altitude engines employing conventional venturi carburetors shall be provided with a preheater capable of providing a heat rise of 120° F. when the engine is operating at 60% of its maximum continuous power.

(b) Airplanes equipped with altitude engines employing carburetors which embody features tending to reduce the possibility of ice formation shall be provided with a preheater capable of providing a heat rise of 100° F. when the engine is operating at 60% of its maximum continuous power.

§ 4b.603 *Carburetor air preheater design.* Means shall be provided to assure adequate ventilation of the carburetor air preheater when the engine is being operated on cold air. The preheater shall be constructed in such a manner as to permit inspection of exhaust manifold parts which it surrounds and also to permit inspection of critical portions of the preheater itself.

§ 4b.604 *Induction system ducts.* Induction system ducts ahead of the first stage of the supercharger shall be provided with drains which will prevent the hazardous accumulation of fuel or moisture in the ground attitude. Sufficient strength shall be incorporated in the ducts to prevent induction system failures resulting from normal backfire conditions. Drains shall not discharge in a location that will constitute a fire hazard. Ducts which are connected to components of the airplane between which relative motion may exist shall incorporate provisions for flexibility.

§ 4b.605 *Induction system screens.* If induction system screens are employed, they shall be located upstream from the carburetor. It shall not be possible for fuel to impinge upon the screen. Screens shall not be located in portions of the induction system which constitute the only passage through which air may reach the engine unless the screen is so located that it can be de-iced. De-icing of screens by means of alcohol shall not be considered acceptable.

§ 4b.606 *Carburetor air cooling.* Installations employing two stage superchargers shall be provided with means to maintain the air temperature at the inlet to the carburetor at or below the maximum established value. Demonstration of compliance with this provision shall be accomplished in accordance with §§ 4b.576-4b.582.

§ 4b.607 *Inter-coolers and after-coolers.* Inter-coolers and after-coolers shall be capable of withstanding without failure any vibration, inertia, and air pressure loads to which they may be subjected in operation.

EXHAUST SYSTEM

§ 4b.611 *General.* (a) The exhaust system shall be constructed and arranged in such a manner as to assure the safe disposal of exhaust gases without the existence of a hazard of fire or carbon monoxide contamination of air in personnel compartments.

(b) Unless suitable precautions are taken, exhaust system parts shall not be located in hazardous proximity to portions of any systems carrying inflammable fluids or vapors nor shall they be located under portions of such systems which may be subject to leakage. All airplane components upon which hot exhaust gases may impinge, or which may be subjected to high temperatures due to proximity to exhaust system parts, shall be constructed of heat resistant materials. All exhaust system components shall be separated from adjacent portions of the airplane, which are outside the engine compartment, by means of fire-resistant shields.

(c) Exhaust gases shall not be discharged at a location that will cause a glare seriously affecting pilot visibility at night, nor shall they discharge within dangerous proximity of any fuel or oil system drains.

(d) All exhaust system components shall be ventilated to prevent the existence of points of excessively high temperature.

§ 4b.612 *Exhaust piping.* Exhaust piping shall be constructed of material suitably resistant to heat and corrosion and shall incorporate provisions to prevent failure due to expansion when heated to operating temperatures. Exhaust pipes shall be supported in a manner adequate to withstand all vibration and inertia loads to which they may be subjected in operation. Portions of the exhaust piping, which are connected to components between which relative motion may exist, shall incorporate provisions for flexibility.

§ 4b.613 *Exhaust heat exchangers.* (a) Exhaust heat exchangers shall be constructed and installed in such a man-

ner as to assure their ability to withstand without failure all vibration, inertia, and other loads to which they may normally be subjected. Heat exchangers shall be constructed of materials that are suitable for continued operation at high temperatures and that are resistant to corrosion due to products contained in exhaust gases.

(b) Provision shall be made for the inspection of all critical portions of exhaust heat exchangers, particularly if a welded construction is employed. Heat exchangers shall be adequately cooled whenever they are subject to contact with exhaust gases.

§ 4b.614 *Exhaust heating of ventilating air.* If an exhaust heat exchanger is used for heating ventilating air, a secondary heat exchanger shall be provided between the primary exhaust gas heat exchanger and the ventilating air system, unless it can be demonstrated that sufficient safety can be obtained by other means.

§ 4b.615 *Exhaust driven turbo-superchargers.* Exhaust driven turbines shall be of an acceptable type or proven suitable for the particular application and shall be installed and supported in a manner to assure their safe operation between normal inspection or overhaul periods. Provisions for expansion and flexibility shall be made between exhaust conduits and the turbine. Provision shall also be made for cooling of turbine parts whose temperature is critical and for lubrication of the turbine. Means shall be provided for automatically limiting the turbine speed to its maximum allowable overspeed value.

FIRE WALL AND COWLING

§ 4b.621 *Fire walls.* All engines, auxiliary power units, fuel-burning heaters, and other combustion equipment which are intended for operation in flight shall be isolated from the remainder of the airplane by means of fire walls or shrouds, or other equivalent means.

[Amdt. 04-1, 11 F. R. 11351]

§ 4b.622 *Fire-wall construction.* (a) Fire walls and shrouds shall be constructed in such a manner that no hazardous quantity of air, fluids, or flame can pass from the engine compartment to other portions of the airplane. All openings in the fire wall or shroud shall be sealed with close-fitting fireproof grommets, bushings or fire-wall fittings.

(b) Fire walls and shrouds shall be constructed of fireproof material and shall be protected against corrosion. The following materials have been found to comply with this section:

(1) Heat- and corrosion-resistant steel 0.015 inch thick;

(2) Low carbon steel, suitably protected against corrosion, 0.018 inch thick.

[Amdt. 04-1, 11 F. R. 11351]

§ 4b.623 *Cowling.* (a) Cowling shall be constructed and supported in such a manner as to be capable of resisting all vibration, inertia, and air loads to which it may normally be subjected. Provision shall be made to permit rapid and complete drainage of all portions of the

cowling in all normal ground and flight attitudes. Drains shall not discharge in locations constituting a fire hazard.

(b) Cowling, unless otherwise specified by these regulations, shall be constructed of fire-resistant material. Those portions of the cowling which are subjected to high temperatures due to their proximity to exhaust system parts or exhaust gas impingement shall be constructed of fire-proof material.

[Amdt. 04-0, 11 F. R. 71, as amended by Amdt. 04-1, 11 F. R. 11351]

§ 4b.623-1 *Fire-resistant aircraft material* (CAA rules which apply to § 4b.623). See § 4b.448-3.

[13 F. R. 7729]

§ 4b.624 *Engine accessory section diaphragm.* Unless equivalent protection can be demonstrated by other means, a diaphragm shall be provided on air-cooled engines, to isolate the engine power section and all portions of the exhaust system from the engine accessory compartment. This diaphragm shall comply with the provisions of § 4b.622.

POWER-PLANT CONTROLS AND ACCESSORIES CONTROLS

§ 4b.631 *Power-plant controls.* All power-plant controls shall comply with the provisions of § 4b.424 with respect to location, grouping, and direction of motion and shall comply with the provisions of § 4b.898 with respect to marking. Controls shall be so located that they cannot be inadvertently operated by personnel entering or leaving the airplane, or while the flight personnel are making normal movements in the cockpit. Controls shall maintain any desired position without constant attention by the flight personnel and shall not tend to creep due to control loads or vibration. Flexible controls shall be of an acceptable type or proven suitable for the particular application. Controls shall have adequate strength and rigidity to withstand operating loads without failure or excessive deflection.

§ 4b.632 *Throttle controls.* A separate throttle control shall be provided for each engine. Throttle controls shall afford a positive and immediately responsive means of controlling the engines. Throttle controls shall be grouped and arranged in such a manner as to permit separate control of each engine and also simultaneous control of all engines.

§ 4b.633 *Ignition switches.* Ignition switches shall provide control for each ignition circuit on each engine. Means shall be provided for quickly shutting off all ignition by the grouping of switches or by providing a master ignition control. If a master control is provided, a suitable guard shall be incorporated to prevent its inadvertent operation.

§ 4b.634 *Mixture controls.* If mixture controls are provided, a separate control shall be provided for each engine. The controls shall be grouped and arranged in such a manner as to permit separate control of each engine and also simultaneous control of all engines.

§ 4b.635 *Propeller speed and pitch controls.* (See also § 4b.476 (a).) It shall be possible to control the propellers separately. The controls shall be grouped and arranged in such a manner as to permit control of the propellers separately and together. The controls shall permit ready synchronization of all propellers.

§ 4b.636 *Propeller feathering controls.* A separate control shall be provided for each propeller. Propeller feathering controls shall be provided with means to prevent inadvertent operation. If feathering is accomplished by movement of the normal pitch or speed control lever, provision shall be made to prevent the movement of this control to the feathering position during normal operation.

§ 4b.637 *Propeller reversing controls.* If the propeller blades can be placed in a pitch position which will produce negative thrust, reversing controls shall be so arranged as to prevent inadvertent operation.

§ 4b.638 *Fuel system controls.* (See § 4b.518.) Fuel jettisoning system controls shall be provided with guards to prevent their inadvertent operation. Such controls shall not be located in close proximity to fire extinguisher controls or any other controls intended for operation in order to combat a fire.

[Amdt. 04-0, 11 F. R. 71, as amended by Amdt. 04-1, 11 F. R. 11351]

§ 4b.639 *Carburetor air reheat controls.* Separate controls shall be provided to regulate the temperature of the carburetor air for each engine.

ACCESSORIES

§ 4b.641 *Power-plant accessories.* (a) Engine mounted accessories shall be of a type satisfactory for installation on the engine involved and shall utilize the provisions made on the engine for the mounting of such units.

(b) Items of electrical equipment subject to arcing or sparking shall be installed so as to minimize the possibility of their contact with any inflammable fluids or vapors which may be present in a free state.

§ 4b.642 *Engine ignition systems.* (a) Battery ignition systems shall be supplemented with a generator which is automatically made available as an alternate source of electrical energy to permit continued engine operation in the event of the depletion of any battery.

(b) The capacity of batteries and generators shall be sufficient to meet the simultaneous demands of the engine ignition system and the greatest demands of any airplane electrical system components which may draw electrical energy from the same source. Consideration shall be given to the condition of an inoperative generator and to the condition of a completely depleted battery when the generator is running at its normal operating speed. If only one battery is provided, consideration shall also be given to the condition in which the battery is completely depleted and the generator is operating at idling speed.

(c) Means shall be provided to warn the appropriate flight personnel if malfunctioning of any part of the electrical system is causing the continuous discharging of a battery that is necessary for engine ignition. (See § 4b.633 for ignition switches.)

POWER-PLANT FIRE PROTECTION

§ 4b.651 *Zones.* (a) Designated fire zones comprise the following regions:

- (1) Engine power section.
- (2) Engine accessory section.
- (3) Complete power-plant compartments in which no isolation is provided between the engine power section and the engine accessory section.
- (4) Auxiliary power unit compartments.
- (5) Fuel-burning heater and other combustion equipment installations.

(b) Such zones shall be protected from fire by compliance with the requirements in §§ 4b.652-4b.655.

[Amdt. 04b-7, 12 F. R. 5960]

INFLAMMABLE FLUIDS

§ 4b.652 *Location of tanks.* No tanks or reservoirs which are a part of a system containing inflammable fluids or gases shall be located in designated fire zones, except where the fluid contained, the design of the system, the materials used in the tank, the shut-off means, all connections, lines, and controls are such as to provide equivalent safety. Not less than ½ inch of clear air space shall be provided between any tank or reservoir and a fire wall or shroud isolating a designated fire zone.

[Amdt. 04-1, 11 F. R. 11351]

§ 4b.653 *Shut-off means.* (a) Means for each individual engine shall be provided for shutting off or otherwise preventing hazardous quantities of fuel, oil, de-icer, and other inflammable fluids from flowing into, within, or through any designated fire zone, except that means need not be provided to shut off flow in lines forming an integral part of an engine. In order to facilitate rapid and effective control of fires such shut-off means shall permit an emergency operating sequence which is compatible with the emergency operation of other equipment, such as feathering the propeller. Shut-off means shall be located outside of designated fire zones, unless equivalent safety is provided (see § 4b.652), and it shall be shown that no hazardous quantity of such inflammable fluid will drain into any designated fire zone after shutting-off has been accomplished.

(b) Adequate provisions shall be made to guard against inadvertent operation of the shut-off means and to make it possible for the crew to reopen the shut-off means after it has once been closed.

[Amdt. 04-1, 11 F. R. 11351]

§ 4b.654 *Lines and fittings.* All lines and fittings for same located in designated fire zones which carry inflammable fluids or gases and which are under pressure or which attach directly to the engine or are subject to relative motion between components, exclusive of those lines and fittings forming an integral part of the engine, shall be flexible, fire-

resistant lines with fire-resistant end fittings of the permanently attached, detachable, or other approved types. Lines and fittings which are not subject to pressure or to relative motion between components shall be of fire-resistant materials.

[Amdt. 04-1, 11 F. R. 11351, as amended by Amdt. 04b-7, 12 F. R. 5960]

§ 4b.654-1 *Fire-resistant aircraft material* (CAA rules which apply to § 4b.654). See §§ 4b.448-1, 4b.448-2, 4b.448-3.

[13 F. R. 7729]

§ 4b.655 *Vent and drain lines.* All vent and drain lines and fittings for same located in designated fire zones and which carry inflammable fluids or gases shall comply with the provisions of § 4b.654, if the Administrator finds that rupture or breakage of a particular drain or vent line may result in a fire hazard.

[Amdt. 04-1, 11 F. R. 11351]

FIRE EXTINGUISHER SYSTEMS

§ 4b.661 *General.* (a) Unless it can be demonstrated that equivalent protection against destruction of the airplane in case of fire is provided by the use of fireproof materials in the nacelle and other components which would be subjected to flame, fire extinguishing systems shall be provided to serve all designated fire zones except in the case of an engine power section which is completely isolated from the engine accessory section by a fireproof diaphragm complying with the provisions of § 4b.622.

(b) The fire extinguishing system, the quantity of extinguishing agent, and the rate of discharge shall be such as to provide two adequate discharges. It shall be possible to direct both discharges to any main engine installation. Individual "one-shot" systems shall be acceptable in the case of auxiliary power units, fuel-burning heaters, and other combustion equipment.

(c) Materials in the fire extinguishing system shall not react chemically with the extinguishing agent so as to constitute a hazard.

[Amdt. 04-1, 11 F. R. 11351, as amended by Amdt. 04b-7, 12 F. R. 5960]

§ 4b.662 *Fire extinguishing agents.* Extinguishing agents employed shall be methyl bromide, carbon dioxide, or any other agent which has been demonstrated to provide equivalent extinguishing action. If methyl bromide or any other toxic extinguishing agent is employed, provisions shall be made to prevent the entrance of harmful concentration of fluid or fluid vapors into any personnel compartments either due to leakage during normal operation of the airplane or as a result of discharging the fire extinguisher on the ground or in flight when a defect exists in the extinguisher system. If a methyl bromide system is provided, the containers shall be charged with dry agent and shall be sealed by the fire extinguisher manufacturer or any other party employing satisfactory recharging equipment. If carbon dioxide is used, it shall not be

possible to discharge sufficient gas into personnel compartments to constitute a hazard from the standpoint of suffocation of the occupants.

§ 4b.663 *Extinguishing agent container pressure relief.* Extinguisher agent containers shall be provided with a pressure relief to prevent bursting of the container due to excessive internal pressures. The discharge line from the relief connection shall terminate outside the airplane in a location convenient for inspection on the ground. An indicator shall be provided at the discharge end of the line to provide a visual indication when the container has discharged.

§ 4b.664 *Extinguishing agent container compartment temperature.* Precautions shall be taken to assure that the extinguishing agent containers are installed in a location where reasonable temperatures can be maintained for effective use of the extinguisher system.

§ 4b.665 *Fire extinguishing system materials.* All components of fire extinguishing systems located in designated fire zones shall be constructed of fireproof materials, except for connections which are subject to relative motion between components of the airplane, in which case they shall be of flexible fire-resistant construction so located as to minimize the possibility of failure.

[Amdt. 04-1, 11 F. R. 11351]

§ 4b.665-1 *Fire-resistant aircraft material (CAA rules which apply to § 4b.665).* See § 4b.448-3.

[13 F. R. 7729]

FIRE DETECTORS

§ 4b.671 *General.* Quick acting fire detectors shall be provided in all designated fire zones and shall be sufficient in number and location to assure the detection of fire which may occur in such zones.

§ 4b.672 *Fire detectors.* Fire detectors shall be constructed and installed in such a manner as to assure their ability to resist without failure all vibration, inertia, and other loads to which they may normally be subjected. Detectors shall be unaffected by exposure to oil, water, or other fluids or fumes which may be present.

[Amdt. 04-0, 11 F. R. 71, as amended by Amdt. 04b-1, 11 F. R. 11351]

PROTECTION OF OTHER AIRPLANE COMPONENTS

§ 4b.676 *Fire-resistant construction.* All airplane surfaces aft of the nacelles, in the region of one nacelle diameter on both sides of the nacelle center line, shall be constructed of fire-resistant material. This provision need not be applied to tail surfaces lying behind nacelles unless the dimensional configuration of the aircraft is such that the tail surfaces could be affected readily by heat, flames, or sparks emanating from a designated fire zone or engine compartment of any nacelle.

[Amdt. 04-1, 11 F. R. 11351]

§ 4b.676-1 *Fire-resistant aircraft material (CAA rules which apply to § 4b.676).* See § 4b.448-3.

[13 F. R. 7729]

SUBPART F—EQUIPMENT

§ 4b.681 *General.* The equipment specified in § 4b.691 is the minimum which shall be installed in the airplane. Such additional equipment as is necessary for a specific type of operation is specified in Part 40 entitled "Air Carrier Operating Certification," Part 41 entitled "Certification and Operation Rules for Scheduled Air Carrier Operations Outside the Continental Limits of the United States," and Part 61 entitled "Scheduled Air Carrier Rules," of this subchapter. All equipment essential to the safe operation of the airplane shall comply with §§ 4b.682-4b.831.

§ 4b.682 *Functional and installation requirements.* Each item of equipment shall be: (a) Of a type and design satisfactory to perform its intended function, (b) adequately labeled as to its identification, function, or operational limitations, or any combination of these, whichever is applicable, (c) properly installed, in accordance with specified limitations of the equipment, and (d) demonstrated to function satisfactorily in the airplane. Items of equipment for which type certification is required are outlined in Part 15 of this subchapter. Such items, when used in the airplane, shall have been certificated in accordance with the provisions of Part 15 of this subchapter (or previous regulations) and such other parts as may be applicable.

BASIC EQUIPMENT

§ 4b.691 *Required basic equipment.* Paragraphs (a) to (c) show the required basic equipment items necessary for type and airworthiness certification of the airplane:

(a) *Flight and navigation instruments.* (See §§ 4b.701-4b.706.)

(1) Air speed indicating system with heated pitot tube or equivalent means of preventing malfunctioning due to icing. (See §§ 4b.696 and 4b.703.)

(2) Altimeter (sensitive). (See § 4b.703.)

(3) Clock (sweep second).

(4) Free air temperature indicator.

(5) Gyroscopic bank and pitch indicator. (See § 4b.706.)

(6) Gyroscopic rate-of-turn indicator (with bank indicator). (See § 4b.706.)

(7) Gyroscopic direction indicator. (See § 4b.706.)

(8) Magnetic direction indicator. (See § 4b.704.)

(9) Rate-of-climb indicator (vertical speed). (See § 4b.703.)

(b) *Power-plant instruments.* (See §§ 4b.711-4b.716.)

(1) Carburetor air temperature indicator for each engine. (See § 4b.716.)

(2) Coolant temperature indicator for each liquid-cooled engine.

(3) Cylinder head temperature indicator for each air-cooled engine. (See § 4b.716.)

(4) Fuel pressure indicator for each pump-fed engine.

(5) For each engine not equipped with an automatic altitude mixture control:

(i) Fuel flowmeter indicator (see § 4b.714) or,

(ii) Fuel mixture indicator.

(6) Fuel quantity indicator for each fuel tank. (See § 4b.713.)

(7) Manifold pressure indicator for each engine.

(8) Oil pressure indicator for each engine.

(9) Oil quantity indicator for each oil tank when a transfer or oil reserve supply system is used. (See § 4b.715.)

(10) Oil temperature indicator for each engine.

(11) Tachometer for each engine.

(12) Fire warning indicators. (See §§ 4b.671 and 4b.672.)

(c) *Miscellaneous equipment.* (1) Approved seats for all occupants. (See § 4b.443.)

(2) Certificated safety belts for all occupants.

(3) A master switch arrangement for electrical circuits other than ignition.

(4) Adequate source(s) of electrical energy.

(5) Electrical protective devices.

(6) Radio communication system (two-way).

(7) Radio navigation system.

(8) Windshield wiper or equivalent for each pilot.

(9) Ignition switch for each and all engines. (See § 4b.633.)

(10) Portable fire extinguisher. (See § 4b.799.)

[Amdt. 04-0, 11 F. R. 71 as amended by Amdt. 04b-6, 12 F. R. 5750]

§ 4b.691-1 *Technical Standard Order TSO-C2a: "Airspeed Indicator (Pitot Static)" (CAA rules which apply to § 4b.691).*—(a) *Introduction.* Under section 601 of the Civil Aeronautics Act of 1938, as amended, and §§ 3.31, 3.655, 4a.31, 4a.535, 4b.41, 4b.691, 6.6, and 6.52 of this chapter, the Administrator of Civil Aeronautics is authorized to adopt standards for airspeed indicators intended for use in civil aircraft. In adopting these standards, consideration has been given to existing Government and industry standards for airspeed indicators.

(b) *Directive.*—(1) *Provision.* The performance requirements for airspeed indicators, as set forth in sections 6 and 7 of SAE Specification AS-391A, Airspeed Indicator (pitot static) revised February 1, 1949,¹ stated below, are hereby established as minimum safety performance standards for airspeed indicators intended for use in civil aircraft:

1. *Purpose.* To specify minimum requirements for Pitot Static Pressure Type of Airspeed Indicators for use in aircraft, the operation of which may subject the instruments to the environmental conditions specified in Section 3.3.

2. *Scope.* This specification covers six types of instruments as follows:

Type I: 30-250 miles per hour range.

Type II: 40-300 miles per hour range.

Type III: 50-400 miles per hour range.

Type IV: 50-450 miles per hour range.

Type V: 50-700 miles per hour range.

¹ Copies may be obtained from the Society of Automotive Engineers, 29 West 39th St., New York, N. Y.

flexed or exercised for a period of 24 hours prior to the start of the tests of section 6.

5.4 *Vibration equipment.* Vibration equipment shall be used which will vibrate at any desired frequency between 500 and 3,000 cycles per minute and shall subject the instrument to vibration such that a point on the instrument case will describe, in a plane inclined 45° to the horizontal plane, a circle, the diameter of which is equal to the amplitude specified herein.

6. *Individual performance requirements.* All instruments shall be subjected to whatever tests the manufacturer deems necessary to demonstrate specific compliance with this specification including the following requirements where applicable.

6.1 *Scale error.* The instrument shall be tested for scale errors at the points of the scale indicated in table III. The tests shall be made by subjecting the instrument to the pressure specified to produce these readings, first with pressure increasing, then with pressure decreasing. With pressure increasing, the pressure shall be brought up to, but shall not exceed the pressure specified to give the desired reading. With pressure decreasing, the pressure shall be brought down to, but shall not fall below the pressure specified to give the desired reading. The errors at the test points shall not exceed the tolerances specified in table III.

6.2 *Friction.* The instrument shall be tested for friction at the test points indicated by an asterisk (*) in table III. The pressure shall be brought up to the desired readings and then held constant while two readings are taken; the first reading being taken before the instrument is vibrated, and the second one after the instrument is vibrated. The difference between any two readings shall not exceed the tolerance in table IV.

6.3 *Position.* A pressure equivalent to one quarter, one half and three quarters scale deflection shall be applied. The change in reading at each deflection produced by rotating the instrument from the vertical to the horizontal position, or 90 degrees to the right or left, while the instrument is vibrated shall not exceed the tolerance specified in table III.

6.4 *Leak.* With both the pitot pressure and static pressure connections simultaneously evacuated to 15 inches of mercury, the leakage shall not cause more than 0.4 inch of mercury pressure drop during a 10-second period. With the static pressure connection open, and pressure equivalent to full scale pointer deflection applied to the pitot pressure connection, the leakage shall not cause more than 1 m. p. h. decrease in indication during a one minute period.

7. *Qualification tests.* As many instruments as deemed necessary to demonstrate that all instruments will comply with the requirements of this section shall be tested in accordance with the manufacturer's recommendations.

hour. Clockwise pointer motion shall indicate increasing airspeed.

4.3 *Visibility.* The pointer and all dial markings shall be visible from any point within the frustum of a cone whose side makes an angle of not less than 30° with the perpendicular to the dial, and whose small diameter is the aperture of the instrument case. The distance between the dial and the cover glass shall be a practical minimum and shall not exceed 0.187 of an inch.

4.4 *Dial markings.*

4.4.1 *Finish.* Unless otherwise specified luminescent (self activating) material shall be applied to all major graduations, numerals and pointer.

4.4.2 *Graduations.* Minor graduations shall be used at intervals not to exceed 5 miles per hour, up to the 300 miles per hour mark. Major graduations shall be used to indicate every 10 miles per hour up to 300 miles per hour.

4.4.3 *Numerals.* Sufficient numerals shall be marked to positively and quickly identify all graduations. Numerals shall distinctly indicate the graduations to which each applies.

4.4.4 *Instrument name.* The word "Airspeed" shall be marked and may be the same finish as the numerals. The inscription "m. p. h." or "knots" shall appear on the dial.

4.5 *Limitation of pointer movements.* The pointer movement shall be limited by stops in the mechanism in such a way that the pointer will not be permitted to rotate more than 10 degrees beyond the last graduation on the dial. Stops may also be incorporated in the instrument mechanism to limit counterclockwise motion of the pointer.

4.6 *Back of case markings.* The back of the case, adjacent to the connections shall be marked as follows:

P—Pitot pressure connection.
S—Static pressure connection.

5. *Test conditions.*

5.1 *Atmospheric conditions.* Unless otherwise specified, all tests required by this specification shall be conducted at an atmospheric pressure of approximately 29.92 inches of mercury, and at an ambient temperature of approximately 22° C. When tests are made with the atmospheric pressure or the temperature substantially different from these values allowances shall be made for the variations from the specified conditions.

5.2 *Vibration (to minimize friction).* Unless otherwise specified, all tests for performance may be made with the instrument subjected to a vibration of 0.002 to 0.005 inch amplitude at a frequency of 1,500 to 2,000 cycles per minute. The term amplitude as used herein indicates the total displacement from positive maximum to negative maximum.

5.3 *Preconditioning.* No pressure shall be applied to the diaphragm or any actuating element of the instrument, nor shall the diaphragm or other actuating element be

4.2 *Indicating method.* These airspeed instruments shall indicate by a means of a pointer moving over a fixed dial. Sensitive types shall have, in addition, an under dial visible through an aperture in the fixed dial for indicating hundreds of miles per

Type VI: 50-425 knots range.

3. *General requirements.*

3.1 *Materials and workmanship.*

3.1.1 *Materials.* Materials shall be of a quality which experience and/or tests have demonstrated to be suitable and dependable for use in aircraft instruments.

3.1.2 *Workmanship.* Workmanship shall be consistent with high grade aircraft instrument manufacturing practice.

3.2 *Identification.* The following information shall be legibly and permanently marked on the instrument or attached thereto:

- Name of instrument (airspeed indicator).
- SAE Specification, AS 391A.
- Manufacturer's part number.
- Manufacturer's serial number or date of manufacture.
- Manufacturer's name or trademark.
- Range.

3.3 *Environmental conditions.* The following are established design requirements only. All tests shall be conducted as specified in sections 5, 6, and 7.

3.3.1 *Temperature.* When installed in accordance with the instrument manufacturer's instructions, the instrument shall function over the range of ambient temperatures from -30° C. to 50° C. and shall not be adversely affected by exposure to temperatures of -65° C. and 70° C.

3.3.2 *Humidity.* The instrument shall function and shall not be adversely affected when exposed to any relative humidity in the range from 0 to 95 percent at a temperature of approximately 32° C.

3.3.3 *Altitude.* The instrument shall function and shall not be adversely affected when subjected to a pressure and temperature range equivalent to -1,000 feet to 40,000 feet standard altitude, except as limited by the application of 3.3.1.

3.3.4 *Vibration.* When installed in accordance with the instrument manufacturer's instructions, the instrument shall function and shall not be adversely affected when subjected to vibrations of not more than 0.010 inch at a frequency from 500 to 3,000 cycles per minute; or of not more than 1.3 g. When specified by the purchaser for use in rotary wing aircraft, the frequency range shall be 150-3,000 cycles per minute.

3.4 *Magnetic effect.* The magnetic effect of the indicator shall not adversely affect the operation of other instruments installed in the same aircraft.

4. *Detail requirements.*

4.1 *Pressure equivalents.* These instruments shall be calibrated to indicate airspeed in accordance with the following pressure equivalents (tables I and II)

It is understood that the unit shall withstand vibrations at higher frequencies, but the acceleration values need not exceed those shown above.

7.1 *Low temperature.* The instrument shall be subjected to a temperature of -30°C . for a period of 3 hours. With the temperature held at -30°C . the instrument shall be tested for scale errors as described in paragraph 6.1. The errors at the test points shall not exceed the tolerances of table III by more than the amount specified in table IV.

7.2 *High temperature.* The instrument shall be subjected to a temperature of 50°C . for a period of 3 hours. With the temperature held at 50°C ., the instrument shall be tested for scale errors as described in paragraph 6.1. The errors at the test points shall not exceed the tolerances of table III by more than the amount specified in table IV.

7.3 *Extreme temperature exposure.* The instrument shall, after alternate exposures to ambient temperatures of -65°C . and 70°C . for periods of 24 hours each and a delay of 3 hours at room temperature following completion of the exposure, meet the requirements of section 6.1. There shall be no evidence of damage as a result of exposure to the extreme temperatures specified herein.

7.4 *Vibration.* With a pressure applied, sufficient to give half scale deflection, the instrument shall be vibrated at 500 cycles per minute and describe a circle of 0.003-0.005 inch diameter. The frequency shall be slowly increased to 3,000 cycles per minute and then slowly decreased to 500 cycles per minute, to determine whether the natural frequency of the instrument is in this range. The drift of the pointer shall not exceed the tolerances of table IV and the instrument pointer shall not oscillate more than the tolerance specified in table IV. After three hours exposure to vibration amplitude as specified in section 3.4.4 and at natural frequency, if between 500 and 3,000 cycles per minute, otherwise at 2,000 cycles per minute, the instrument shall meet the requirements of section 6. No damage shall be evident after this test.

7.5 *Seasoning.* The instrument shall be subjected to one hundred applications of a differential pressure sufficient to produce approximately full scale deflection. Not less than one hour following this test the instrument shall be tested for scale errors as described in paragraph 6.1, except that the scale error test shall not exceed the tolerance specified in table III by more than the amount specified in table IV.

7.6 *Drift.* The instrument shall be subjected to a differential pressure sufficient to produce approximately $\frac{1}{4}$ scale deflection. After being subjected to a pressure for a period of one hour, the instrument shall be tested as described in paragraph 6.1 except scale errors shall be determined for increasing pressure only. The reading of the instrument shall not have increased by more than the amount specified in table IV.

7.7 *Low temperature exposure.* The instrument shall be subjected to a temperature of -65°C . for a period of 24 hours. With the temperature held at -65°C . the instrument shall function. In addition, after the temperature is raised to -30°C . and held for a period of 3 hours, the instrument shall meet the requirements of paragraph 7.1.

7.8 *Magnetic effect.* The magnetic effect of the instrument shall be determined in terms of the deflection of a free magnet, approximately $1\frac{1}{2}$ inches long, in a magnetic field with a horizontal intensity of 0.18, plus or minus 0.01 gauss, when the indicator is held in various positions on an east-west line with its nearest part 5 inches from the center of the magnet. (An aircraft compass with the compensating magnets removed therefrom may be used as a free magnet for this test.) The maximum deflection of the magnet shall not exceed 1° for any pointer deflection.

7.9 *Humidity test.* The instrument shall be subjected to the extreme conditions specified in paragraph 3.4.2 for a period of 10

hours, after which it shall meet the requirements of section 6.

(2) *Application.* (i) Airspeed indicators complying with the specifications appearing in this section are hereby approved for all aircraft. Airspeed indicators already approved by the Administrator may continue to be installed in aircraft.

(a) For which an application for original type certificate is made prior to the effective date of this section.

(b) The prototype of which is flown within 1 year after the effective date of this section, and

(c) The prototype of which is not flown within 1 year after the effective date of this section if due to causes beyond the applicant's control.

(ii) If an alteration involving a change in type or model of airspeed indicator is made within 9 months after the effective date of this section, previously approved types of airspeed indicators may be installed. However, in any such change made after the 9-month period, new types of airspeed indicators installed in aircraft used in instrument flight shall meet the specifications contained herein.

(c) *Specific instructions—(1) Marking.* In addition to the identification information required in the referenced specification, each airspeed indicator shall be permanently marked with the Technical Standard Order designation, CAA-TSO-C2a, to identify the airspeed

indicator as meeting the requirements of this section in accordance with the manufacturers' statement of conformance outlined below. This identification will be accepted by the Civil Aeronautics Administration as evidence that the established minimum safety requirements for airspeed indicators have been met.

(2) *Data requirements.* None.

(3) *Effective date.* After March 1, 1949, specifications contained in this section will constitute the basis for Civil Aeronautics Administration approval of airspeed indicators for use in certificated aircraft used in instrument flight.

(4) *Deviations.* Requests for deviation from, or waiver of, the requirements of this section, which affect the basic airworthiness of the component, should be submitted for approval by the Chief, Aircraft Service, Office of Aviation Safety, Civil Aeronautics Administration. These requests should be addressed to the nearest Regional Office of the Civil Aeronautics Administration, Attention: Superintendent, Aircraft Branch.

(5) *Conformance.* (i) The manufacturer shall furnish to the Civil Aeronautics Administration, Aircraft Service, Attention: A-298, Washington 25, D. C., a written statement of conformance signed by a responsible official of his company, setting forth that the airspeed indicators to be produced by him meet the minimum safety requirements established in this section. Immediately thereafter, distribution of the airspeed indicators conforming with the terms of this section may be started and continued.

(ii) The prescribed identification on the airspeed indicator does not relieve the aircraft manufacturer or owner of responsibility for the proper application of the airspeed indicator in his aircraft, nor waive any of the requirements concerning type certification of the aircraft in accordance with existing Civil Air Regulations.

(iii) If complaints of nonconformance with the requirements of this section are brought to the attention of the Civil Aeronautics Administration, and investigation indicates that such complaints are justified, the Administrator will take appropriate action to restrict the use of the product involved.

(iv) Copies of this Technical Standard Order and other Technical Standard Orders may be obtained from the Civil Aeronautics Administration, Aviation Information Staff, Washington 25, D. C.

[Supp. 5, 14 F. R. 3365]

§ 4b.691-2 *Technical Standard Order TSO-C3a: "Turn-and-Bank Indicator" (CAA rules which apply to § 4b.691) —(a) Introduction.* (1) Turn-and-bank indicators are in the class of aircraft components which the Administrator of Civil Aeronautics is authorized to approve in accordance with Parts 3, 4a, 4b, and 6 of this subchapter.

(2) This Technical Standard Order is intended to serve as a criterion by which the product manufacturer can obtain Civil Aeronautics Administration approval of his turn-and-bank indicator.

(3) In the establishment of this Technical Standard Order, consideration has been given to existing Government and industry standards for turn-and-bank

indicators for the purpose of adopting the performance requirements of one of the recognized aeronautical standards as the minimum safety requirements for turn-and-bank indicators which are intended for use in civil aircraft. The specification of the Society of Automotive Engineers for turn-and-bank indicators contains such requirements.

(b) *Directive.*

(1) *Provision.* Pursuant to §§ 3.31, 3.668, 4a.31, 4a.535, 4a.550, 4b.41, and 4b.691 of the Civil Air Regulations, which authorize the Administrator to approve aircraft equipment, the performance requirements for turn-and-bank indicators as set forth in SAE Specification AS-395, Turn-and-Bank Indicator, dated July 1, 1947,¹ stated below, are hereby established as minimum safety requirements for turn-and-bank indicators which are intended for use in civil aircraft:

1. *Purpose.* To specify minimum requirements for turn and bank indicators for use in aircraft, the operation of which may subject the instruments to the environmental conditions specified in section 3.4.

2. *Scope.* This specification covers three basic types of instruments as follows:

Type I. Air driven.

Type II. DC operated.

Type III. AC operated.

3. *General requirements.*

3.1. *Materials and workmanship.*

3.1.1. *Materials.* Materials shall be of a quality which experience and/or tests have demonstrated to be suitable and dependable for use in aircraft instruments.

3.1.2. *Workmanship.* Workmanship shall be consistent with high grade aircraft instrument manufacturing practice.

3.2. *Radio interference.* The instrument shall not be the source of objectionable interference, under operating conditions at any frequencies used on aircraft, either by radiation or feed back, in radio sets installed in the same aircraft as the instrument.

3.3. *Identification.* The following information shall be legibly and permanently marked on the instrument or attached thereto:

(a) Name of instrument (Turn and bank indicator).

(b) SAE Specification, AS-395.

(c) Rating (nominal electric or vacuum, etc.).

(d) Manufacturer's part number.

(e) Manufacturer's serial number or date of manufacture.

(f) Manufacturer's name or trademark.

3.4. *Environmental conditions.* The following are established design criteria only. All tests shall be run as per sections 5, 6 and 7.

3.4.1. *Temperature.* When installed in accordance with the instrument manufacturer's instructions the instrument shall function over the range of ambient temperature from -30°C . to 50°C . and shall not be adversely affected by exposure to temperatures in the range of -65°C . to 70°C .

3.4.2. *Humidity.* The instrument shall function and shall not be adversely affected when exposed to a relative humidity of up to and including 95% at a temperature of approximately 32°C .

3.4.3. *Altitude.* The instrument shall function and shall not be adversely affected when subjected to a pressure and temperature range equivalent to $-1,000$ to $40,000$ feet standard altitude except that the instrument temperature shall not be lower than -30°C .

3.4.4. *Vibration.* When installed in accordance with the instrument manufacturer's instructions the instruments shall function and not be adversely affected when subjected to vibrations of not more than 0.010 inch at a frequency from 500 to $3,000$ cycles per minute or of not more than 1.3 g . When specified by the purchaser for use in rotary wing aircraft, the frequency range shall be 150 – $3,000$ cycles per minute.

NOTE: It is understood that the unit shall withstand vibration at higher frequencies, but the acceleration values need not exceed those shown above.

4. *Detail requirements.*

4.1. *Indicating method.* Turns shall be indicated by means of a pointer, deflecting in direction of turn. Banks shall be indicated by means of a black ball, free to move in a curved transparent tube.

4.2. *Visibility.* Both bank and turn indications shall be visible from any point within the frustum of a cone whose side makes an angle of not less than 30 degrees with the perpendicular to the dial and whose small diameter is the aperture of the instrument case. The distance between the dial and the cover glass shall be a practical minimum and shall not exceed 0.187 inch.

4.3. *Dial markings.*

4.3.1. *Finish.* Unless otherwise specified, luminescent (self-activating) material shall be applied to all markings, pointer and the inclinometer backing.

4.3.2. *Letters.* Letters "L" and "R" shall be legibly marked on the dial.

4.3.3. *Instrument name.* The words "Turn and Bank" shall be marked and may be indicated in the same finish as the letters.

4.4. *Power variations.* The instrument shall properly function with a voltage and frequency variation of $\pm 10\%$ of the rated value (provided the a. c. voltage and frequency vary in the same direction) and/or $\pm 30\%$ of the rated vacuum pressure.

5. *Test conditions.*

5.1. *Atmospheric conditions.* Unless otherwise specified, all tests required by this specification shall be made at an atmospheric pressure of approximately 29.92 inches of mercury and at an ambient temperature of approximately 22°C . When tests are made with atmospheric pressure or temperature substantially different from these values allowance shall be made for the variation from the specified conditions.

5.2. *Vibration (to minimize friction).* Unless otherwise specified all test for performance may be made with the instrument subjected to a vibration of 0.002 to 0.005 inch amplitude at a frequency of $1,500$ to $2,000$ cycles per minute. The term amplitude as used herein indicates the total displacement from positive maximum to negative maximum.

5.3. *Vibration stand.* A vibration stand shall be used which will vibrate at any desired frequency between 500 and $3,000$ cycles per minute and shall subject the instrument to vibration such that a point on the instrument case will describe in a plane inclined 45 degrees to the horizontal plane, a circle, the diameter of which is equal to the amplitude specified herein.

5.4. *Turntable.* A turntable which can be operated smoothly through the ranges specified herein shall be used for making calibration tests.

5.5. *Power conditions.* Unless otherwise specified all tests for performance shall be conducted at the power rating recommended by the manufacturer.

5.6. *Normal operation.* All instruments shall be operated at normal power for at least five minutes prior to conducting any tests (unless otherwise specified).

6. *Individual performance requirements.* All instruments or components of such shall be subjected to whatever tests the manufacturer deems necessary to demonstrate

specific compliance with this specification including the following requirements where applicable.

6.1. *Bank indicator zero position.* With the instrument in normal position with the lower mounting holes on a horizontal line, the position of the ball shall be within $\frac{1}{32}$ inch of the zero position.

6.2. *Bank indicator friction.* The ball shall move smoothly and without sticking throughout the full length of the tube.

6.3. *Bank indicator visibility.* With the ball in the extreme position at each end of the tube at least one half of it shall be visible from a point 12 inches directly in front of the zero mark.

6.4. *Bank indicator filling.* The instrument shall be rotated so that all the air in the tube is trapped in the expansion chamber. Then, with the plane of the dial vertical, the instrument shall be rotated to an angle of roll of 45° . With the expansion chamber end of the tube low, no part of the air bubble shall be visible from a point 12 inches directly in front of the bank indicator zero position.

6.5. *Turn indicator starting.*

6.5.1. *Type I requirements.* The gyro rotor shall start to rotate and continue to run on a suction not to exceed 50% of rated value. Rated instrument performance speed shall be reached within five minutes after normal rated suction is applied.

6.5.2. *Types II and III requirements.* The gyro rotor shall start to rotate and continue to operate at a speed sufficient for proper performance of the instrument on an applied voltage not to exceed 80% of the rated voltage. This speed shall be reached within five minutes after application of the voltage.

6.6. *Turn indicator sensitivity, room temperature.* Starting in normal position and operating under rated power, the instrument shall be rotated about the vertical axis at the rates specified in Table I. Deflections of the turn indicator pointer shall be of the magnitude shown in Table I. Pointer motion shall be smooth.

6.7. *Dielectric test (Types II and III only).* The insulation shall be subjected to a dielectric test with a R. M. S. voltage at a commercial frequency applied for a period of five seconds equivalent to five times normal circuit operating voltage. Except where circuits include components for which such a test would not be appropriate, then the test voltage shall be 1.25 times normal circuit operating voltage. The insulation resistance shall not be less than 20 megohms at that voltage.

7. *Qualification tests.* As many instruments as deemed necessary to demonstrate that all instruments will comply with the requirements of this section shall be tested in accordance with the manufacturer's recommendations.

7.1. *Case leakage.* (Type I only.) A differential pressure of 15 inches of mercury between the inside and outside of the case shall not result in a leakage greater than that which will cause a pressure drop of 0.4 inch of mercury in 10 seconds.

7.2. *Bank indicator damping (room temperature).* When the instrument is suddenly rotated from a position of 12 degrees bank through the vertical to 12 degrees opposite bank, the time for the ball to move from the bank indicator zero position to the rest position at the end of the tube shall be 0.2 second or more.

7.3. *Bank indicator damping (low temperature).* The instrument shall be exposed without operating to a temperature of -65°C ., for one hour. Then the instrument shall be tested as specified in Paragraph 7.2 except that the instrument shall operate at a temperature of -30°C . The time for ball motion from the zero position of the bank indicator to the rest position at the end of the tube shall not exceed four seconds.

7.4. *Bank indicator leakage.* The exposure of the instrument to a temperature of 70°C . for two hours shall not cause appreciable

¹ Copies may be obtained from the Society of Automotive Engineers, 29 West 39th St., New York, N. Y.

change in the size of the air bubble at room temperature.

7.5. *Magnetic effect.* The magnetic effect of the indicator shall be determined in terms of the deflection of a free magnet, approximately $1\frac{1}{2}$ inches long, in a magnetic field with a horizontal intensity of 0.18 (± 0.01) gauss when the indicator is held in various positions on an east-west line with its nearest part 5 inches from the center of the magnet. An aircraft compass with the compensating magnets removed therefrom may be used as the free magnet for this test. This test shall be made first with the instrument not operating and then shall be repeated with the instrument in normal operation. The maximum deflection of the magnet shall not exceed 2 degrees for any pointer position.

7.6. *Turn indicator damping, room temperature.* The instrument operating under rated power in normal position, shall be rotated about the vertical axis at a rate which causes full scale pointer deflection. The turn shall be stopped suddenly and the pointer shall return to the zero mark without crossing it in not less than two nor more than four seconds.

7.7. *Turn indicator sensitivity, low temperature.* After exposure to temperature of -30°C . for three hours, without operating, the instrument while still at -30°C . shall meet the requirements of paragraph 6.6 except that pointer deflection shall be as indicated in Table II. The performance shall be checked within ten minutes after power is applied. When turning is stopped the pointer shall return smoothly to zero within $\frac{1}{2}$ inch.

7.8. *Turn indicator sensitivity, high temperature.* The conditions of paragraph 6.6 shall also be met at a test temperature of 70°C .

7.9. *Vibration.* With the gyro operating under rated power the instrument shall be vibrated at 500 cycles per minute and describe a circle of 0.003 to 0.005 inch diameter. The frequency shall be slowly increased to 3,000 cycles per minute and then decreased to 500 cycles per minute, to determine whether the natural frequency of the instrument occurs in this range. At no time shall the pointer leave the zero position more than $\frac{1}{2}$ inch, and the ball shall remain at zero within $\frac{1}{16}$ inch. After three hours exposure to vibration amplitude as specified in section 3.4.4 and at the natural frequency of between 500 and 3,000 cycles per minute, otherwise at 2,000 cycles per minute, no damage shall be evident and the instrument shall meet the requirements of section 6.

7.10. *Humidity.* The instrument shall be operated under the extreme conditions specified in section 3.4.2 for a period of 10 hours after which it shall meet the requirements of section 6.

(2) *Application.* (i) Turn-and-bank indicators complying with the specifications appearing in this Technical Standard Order are hereby approved for all

aircraft. Turn-and-bank indicators already approved by the Administrator may continue to be installed in aircraft.

(a) For which an application for original type certificate is made prior to the effective date of this order.

(b) The prototype of which is flown within 1 year after the effective date of this order, and

(c) The prototype of which is not flown within 1 year after the effective date of this order if due to causes beyond the applicant's control.

(ii) If a major change is made in the installation within 9 months after the effective date of this order involving a change in type or model of turn-and-bank indicator, previously approved types of turn-and-bank indicators may be installed. However, in any such change made after the 9-month period, new types of turn-and-bank indicators installed in aircraft used in instrument flight shall meet the specifications contained herein.

(c) *Specific instructions.*

(1) *Marking.* In addition to the identification information required in the referenced specification, each turn-and-bank indicator shall be permanently marked with the Technical Standard Order designation "CAA-TSO-C3" to identify the turn-and-bank indicator as meeting the requirements of this order in accordance with the manufacturer's statement of conformance outlined below. This identification will be accepted by the Civil Aeronautics Administration as evidence that the established minimum safety requirements for turn-and-bank indicators have been met.

(2) *Data requirements.* None.

(3) *Effective date.* After July 1, 1948, specifications contained in this Technical Standard Order will constitute the basis for Civil Aeronautics Administration approval of turn-and-bank indicators for use in certificated aircraft used in instrument flight.

(4) *Deviations.* Requests for deviation from, or waiver of, the requirements of this order, which affect the basic airworthiness of the component, should be submitted for approval by the Director, Aircraft and Components Service, Office of Safety Regulation, Civil Aeronautics Administration. These requests should be addressed to the nearest regional office of the Civil Aeronautics Administration, Attn: Superintendent, Aircraft and Components Branch.

(5) *Conformance.* (i) The manufacturer shall furnish to the CAA, Aircraft and Components Service, A-298, Washington 25, D. C., a written statement of conformance signed by a responsible official of his company, setting forth that the turn-and-bank indicator to be produced by him meets the minimum safety requirements established in this order. Immediately thereafter distribution of the turn-and-bank indicator conforming with the terms of this order may be started and continued.

(ii) The prescribed identification on the turn-and-bank indicator does not relieve the aircraft manufacturer or owner of responsibility for the proper application of the turn-and-bank indicator in his aircraft, nor waive any of the require-

ments concerning type certification of the aircraft in accordance with existing Civil Air Regulations.

(iii) If complaints of nonconformance with the requirements of this order are brought to the attention of the Civil Aeronautics Administration, and investigation indicates that such complaints are justified, the Administrator will take appropriate action to restrict the use of the product involved.

(iv) Copies of this Technical Standard Order and other Technical Standard Orders may be obtained from the Civil Aeronautics Administration, Aviation Information Staff, Washington 25, D. C.

[13 F. R. 3845, 7731]

§ 4b.691-3 *Technical Standard Order TSO-C4b: "Bank and Pitch Indicator (Stabilized Type) (Gyro Horizon, Attitude Gyro)"* (CAA rules which apply to § 4b.691) — (a) *Introduction.* Under section 601 of the Civil Aeronautics Act of 1938, as amended, and §§ 4a.31 and 4a.550 of this chapter, and §§ 4b.41 and 4b.691, the Administrator of Civil Aeronautics is authorized to adopt standards for bank and pitch indicators intended for use in civil aircraft. In adopting these standards, consideration has been given to existing Government and industry standards for bank and pitch indicators.

(b) *Directive—(1) Provision.* The performance requirements for bank and pitch indicators, as set forth in sections 6 and 7 of SAE Specification AS-396 Bank and Pitch Indicator, dated August 1, 1947,¹ stated below, with the exceptions hereinafter noted, are hereby established as minimum safety performance standards for bank and pitch indicators intended for use in civil aircraft:

1. *Purpose.* To specify minimum requirements for gyroscopically stabilized bank and pitch indicators for use in aircraft, the operation of which may subject the instrument to the environmental conditions specified in section 3.4.

2. *Scope.* This specification covers two basic types as follows:

Type I. Having limited freedom of operation.

Type II. Having unlimited freedom of operation.

3. *General requirements.*

3.1. *Material and workmanship.*

3.1.1. *Materials.* Materials shall be of a quality which experience and/or tests have demonstrated to be suitable and dependable for use in aircraft instruments.

3.1.2. *Workmanship.* Workmanship shall be consistent with high-grade aircraft instrument manufacturing practice.

3.2. *Radio interference.* The instrument shall not be the source of objectionable interference, under operating conditions at any frequencies used on aircraft, either by radiation or feed-back, in radio sets installed in the same aircraft as the instrument.

3.3. *Identification.* The following information shall be legibly and permanently marked on the instrument or attached thereto:

- Name of instrument.
- S. A. E. Spec. AS 396.
- Rating (electrical, vacuum, etc.).
- Manufacturer's part number.
- Manufacturer's serial number or date of manufacture.

¹ Copies may be obtained from the Society of Automotive Engineers, 29 West 39th St., New York, N. Y.

(f) Manufacturer's name and/or trademark.

8.4. *Environmental conditions.* The following conditions have been established as design criteria only. Tests shall be conducted as specified in sections 5, 6 and 7.

3.4.1. *Temperature.* When installed in accordance with the instrument manufacturer's instructions the unit shall function over the range of ambient temperatures shown in column A below and shall not be adversely affected by exposure to the temperatures shown in column B below:

Instrument location	A	B
Heated areas (temperature controlled)	-30° to 50° C.	-65° to 70° C.
Unheated areas (temperature uncontrolled)	-55° to 70° C.	-65° to 70° C.

3.4.2. *Humidity.* The instrument shall function and not be adversely affected when exposed to a relative humidity up to and including 90 percent at a temperature of approximately +32° C.

3.4.3. *Altitude.* The instrument shall function and not be adversely affected when subjected to a pressure and temperature range equivalent to -1,000 to +40,000 feet standard altitude, except as limited by application of section 3.4.1.

3.4.4. *Vibration.* When installed in accordance with the instrument manufacturer's instructions, the units shall function and shall not be adversely affected when subject to the following vibrations:

Type of instrument mounting	Cycles per minute	Amplitude	Maximum acceleration
Shock mounted panel instruments	500-3000	Inch 0.005	0.8 g
Unshock mounted panel instruments	500-3000	.010	1.3 g
Structure mounted instruments	500-3000	.030	3.8 g

† It is understood that the unit shall withstand vibration at higher frequencies, but the acceleration value need not exceed those shown above.

When specified by the purchaser for use in rotary wing aircraft, the frequency range shall be 150-3,000 cycles per minute.

4. Detail requirements.

4.1. *Indicating method.* One of the following methods of indication shall be employed:

Method I—Horizontal bar which moves with respect to a fixed pitch reference marker. At the top of the dial, a pointer which moves angularly with respect to the bezel mask. Horizontal bar appears to move toward top of instrument face for dive and appears to rotate clockwise for left bank. Banking pointer appears to rotate clockwise for left bank.

Method II—Spherical dial which moves with respect to a fixed reference marker. The spherical dial appears to move down for dive and appears to rotate clockwise for left bank.

4.2. Operating range.

Type I—The useful operating range and the indicating range of the instrument shall be at least plus or minus 60 degrees in pitch and at least plus or minus 90 degrees in roll.

Type II—The useful operating range of the instrument shall be through 360 degrees in pitch and 360 degrees in roll. The range of indication in pitch for Method I indication shall be at least plus or minus 25 degrees and for Method II it shall be 360 degrees.

4.3. Dial markings.

4.3.1. Increments.

Type I—Right and left bank graduations shall be provided at intervals not to exceed 30 degrees between 0 and 90 degrees.

Type II—Bank graduations shall be as specified for Type I above. In addition, the sphere shall be graduated at intervals not to exceed 30 degrees from 0 to 90 degrees above and below the horizontal centerline.

4.3.2. *Visibility.* Index and dial markings shall be visible from any point within the frustum of a cone the side of which makes an angle of 30 degrees with the perpendicular to the dial and small diameter of which is the aperture of the instrument case.

4.3.3. *Finish.* Unless otherwise specified, luminescent material (self-activating) shall be applied to major graduations and numerals.

4.4. *Power variation.* All units shall properly function with $\pm 15\%$ variation in D. C. voltage and/or 10% variation in A. C. voltage and frequency, provided the A. C. voltage and frequency vary in the same direction.

4.5. *Turn error.* The pitch or bank indication error resulting from a coordinated turn of 180 degrees in 1 minute at a true airspeed of 180 m. p. m. shall not exceed 5 degrees.

4.6. *Gyro caging provisions.* Unless the gyro assembly has unrestricted freedom of operation in the pitch and roll axes, means shall be provided for caging and/or releveling the gyro. Means shall be provided to indicate when the gyro is caged, except when it is not possible to leave the gyro in caged condition.

4.7. *Power indication.* Means shall be provided to permit the operation of a device to indicate whether the instrument is receiving power.

5. Test conditions.

5.1. *Atmospheric conditions.* Unless otherwise specified, all tests required by this specification shall be made at an atmospheric pressure of approximately 29.92 inches of mercury and at an ambient temperature of approximately 220. When tests are made with the atmospheric pressure or the temperature substantially different from these values, allowance shall be made for the variation from the specified conditions.

5.2. *Vibration (to minimize friction).* Unless otherwise specified, all tests for performance may be made with the instrument subjected to a vibration of 0.002 to 0.005 inch amplitude at a frequency of 1,500 to 2,000 cycles per minute. The term amplitude as used herein indicates the total displacement from positive maximum to negative maximum.

5.3. *Power conditions.* Unless otherwise specified, all tests for performance shall be conducted at the power rating recommended by the manufacturer.

5.4. *Position.* Unless otherwise specified, all tests shall be made with the instrument in normal level position.

5.5. *Vibration stand.* For vibration tests a stand shall be used which will vibrate at any desired frequency between 500 and 8,000 cycles per minute and shall subject the instrument to vibration such that a point on the instrument case will describe, in a plane inclined 45 degrees to the horizontal plane, a circle, the diameter of which is equal to the amplitude specified herein.

6. *Individual performance requirements.* All instruments, or components of such, shall be subjected to whatever tests the manufacturer deems necessary to demonstrate specific compliance with this specification, including the following requirements where applicable:

6.1. *Starting.* The gyro rotor shall start to rotate and continue to run on application of 50 percent of rated suction for air operated instruments and 80 percent of rated voltage for electrically operated instruments. Rated instrument performance speed shall be reached within 3 minutes after normal rated power is applied.

6.2. *Roll, pitch and yaw.* When the gyro has erected and attained equilibrium speed, and the instrument has been oscillated through an angle of $\pm 7\frac{1}{2}$ degrees about

each axis at a frequency of 5 to 7 cycles per minute for 10 minutes and then returned to level position, the alignment of the bank pointer (or vertical centerline of sphere) with their respective zero reference markers shall be within one degree.

6.3. *Climbing and diving.* With the instrument level, the gyro running at equilibrium speed and the gyro offset to the 20 degree climb indication, the time required for the gyro to erect to the 10 degree climb indication shall not exceed 8 minutes.

The time required to erect from the 10 degree climb indication to the zero pitch indication shall not exceed 12 minutes.

6.4. *Banking.* With the instrument level, the gyro running at equilibrium speed and the gyro offset to the 20 degree right bank indication, the time required for the gyro to erect to the 10 degree right bank indication shall not exceed 8 minutes.

The time required to erect from the 10 degree right bank indication to the zero bank indication (within 1 degree) shall not exceed 12 minutes.

The same tolerances shall apply when the gyro is offset to the 20 degree left bank indication and allowed to erect to the zero bank indication.

6.5. *Dielectric test.* The instrument shall be subject to a dielectric test with a R. M. S. voltage equivalent to five times operating voltage, but at a commercial frequency, applied between each ungrounded terminal and the instrument case for a period of 5 seconds. The breakdown resistance shall not be less than 20 megohms at that voltage (A. C. or D. C. as applicable).

7. *Qualification tests.* As many instruments as deemed necessary to demonstrate that all instruments will comply with the requirements of this section shall be tested in accordance with the manufacturer's recommendations.

7.1. *Low temperature operation.* After exposure to an ambient temperature of -30° C. for 5 hours, without operating, the instrument shall start upon application of rated power and at that temperature shall meet the requirements of section 6.2 except that the allowable alignment tolerances shall be 2 degrees.

7.2. *High temperature operation.* The requirements of section 7.1 shall apply except that the ambient temperature for exposure and test shall be 50° C.

7.3. *Extreme temperature exposure.* After 3 hours at room temperature following alternate exposures to ambient temperatures of -65° C. and 70° C. for 24 hours each, without operating, the instrument shall meet the requirements of section 6.2. No damage shall have resulted from the extreme temperature exposure specified herein.

7.4. *Magnetic effect.* The magnetic effect of the indicator shall be determined in terms of the deflection of a free magnet, approximately 1½ inches long, in a magnetic field with a horizontal intensity of 0.18 (± 0.01) gauss when the indicator is held in various positions on an east-west line with its nearest part 5 inches from the center of the magnet. This test shall first be made with the indicator not operating and then shall be repeated with the indicator in normal operation. The maximum deflection of the free magnet shall not exceed 5 degrees for any indicating or reference position.

7.5. *Humidity.* After operating under the extreme condition specified in section 3.4.2 for 10 hours, the instrument shall meet the requirements of section 6.2.

7.6. *Vibration.* The instrument(s) shall be subjected, while in normal operation, to vibration with an amplitude of 0.005 inch at frequencies from 1,000 to 3,000 cycles per minute in order to determine whether the natural frequency of the instrument(s) is in this frequency range. After 3 hours' exposure to vibration amplitudes as specified in section 3.4.4 and at the natural frequency, if between 1,000 and 3,000 c. p. m., otherwise

at 2,000 c. p. m., the instrument(s) shall meet the requirements of section 6.1, 6.2 and 6.3. No damage shall be evident after this test.

(i) **Exceptions.** (a) Section 6.5 Dielectric Test. Last sentence: "The breakdown resistance shall not be less than 5 megohms at that voltage (A. C. or D. C. as applicable)."

(b) Section 7.5 Humidity. External filters may be used when necessary in the humidity test.

(2) **Application.** (i) Bank and pitch indicators complying with the specifications appearing in this order are hereby approved for all aircraft. Bank and pitch indicators already approved by the Administrator may continue to be installed in aircraft:

(a) For which an application for original type certificate is made prior to the effective date of this order.

(b) The prototype of which is flown within one year after the effective date of this order, and

(c) The prototype of which is not flown within one year after the effective date of this order if due to causes beyond the applicant's control.

(ii) If an alteration involving a change in type or model of bank and pitch indicator is made within nine months after the effective date of this order, previously approved types of bank and pitch indicators may be installed. However, in any such change made after the nine month period, new types of bank and pitch indicators installed in aircraft used in instrument flight shall meet the specifications contained herein.

(c) **Specific instructions—(1) Marking.** In addition to the identification information required in the referenced specification, each bank and pitch indicator shall be permanently marked with the Technical Standard Order designation, CAA-TSO-C4b, to identify the bank and pitch indicator as meeting the requirements of this order in accordance with the manufacturers' statement of conformance outlined in subparagraph (5) of this paragraph. This identification will be accepted by the Civil Aeronautics Administration as evidence that the established minimum safety requirements for bank and pitch indicators have been met.

(2) **Data requirements.** None.

(3) **Effective date.** After May 1, 1949, specifications contained in this order will constitute the basis for Civil Aeronautics Administration approval of bank and pitch indicators for use in certificated aircraft used in instrument flight.

(4) **Deviations.** Requests for deviation from, or waiver of, the requirements of this order, which affect the basic airworthiness of the component, should be submitted for approval by the Chief, Aircraft Service, Office of Aviation Safety, Civil Aeronautics Administration. These requests should be addressed to the nearest Regional Office of the Civil Aeronautics Administration, Attention: Superintendent, Aircraft Branch.

(5) **Conformance.** (i) The manufacturer shall furnish to the Civil Aeronautics Administration, Aircraft Service, Attention: A-298, Washington 25, D. C., a written statement of conformance signed by a responsible official of his company, setting forth that the bank and pitch

indicator to be produced by him meets the minimum safety requirements established in this order. Immediately thereafter distribution of the bank and pitch indicator conforming with the terms of this order may be started and continued.

(ii) The prescribed identification on the bank and pitch indicator does not relieve the aircraft manufacturer or owner of responsibility for the proper application of the bank and pitch indicator in his aircraft, nor waive any of the requirements concerning type certification of the aircraft in accordance with existing Civil Air Regulations.

(iii) If complaints of nonconformance with the requirements of this order are brought to the attention of the Civil Aeronautics Administration, and investigation indicates that such complaints are justified, the Administrator will take appropriate action to restrict the use of the product involved.

(iv) Copies of this Technical Standard Order and other Technical Standard Orders may be obtained from the Civil Aeronautics Administration, Aviation Information Staff, Washington 25, D. C.

[Supp. 6, 14 F. R. 3461]

§ 4b.691-4 **Technical Standard Order TSO-C5b: "Direction Indicator, Non-Magnetic, Stabilized Type (Directional Gyro)"** (CAA rules which apply to § 4b.691)—(a) **Introduction.** Under section 601 of the Civil Aeronautics Act of 1938, as amended, and §§ 4a.31 and 4a.550 of this chapter, and §§ 4b.41 and 4b.691, the Administrator of Civil Aeronautics is authorized to adopt standards for non-magnetic direction indicators intended for use in civil aircraft. In adopting these standards, consideration has been given to existing Government and industry standards for non-magnetic direction indicators.

(b) **Directive—(1) Provision.** The performance requirements for non-magnetic direction indicators, as set forth in sections 6 and 7 of SAE Specification AS-397, Direction Indicator, Non-Magnetic, Stabilized Type (Directional Gyro) dated February 1, 1947¹, stated below, with the exceptions hereinafter noted, are hereby established as minimum safety performance standards for non-magnetic direction indicators intended for use in civil aircraft:

1. **Purpose.** To specify minimum requirements for non-magnetic gyroscopically stabilized direction indicators for use in aircraft.

2. **Scope.** This specification covers two basic types as follows:

Type I. Air operated.
Type II. Electrically operated.

3. **General requirements:**

3.1. **Material and workmanship.**

3.1.1. **Materials.** Materials shall be of a quality which experience and/or tests have demonstrated to be suitable and dependable for use in aircraft instruments.

3.1.2. **Workmanship.** Workmanship shall be consistent with high-grade aircraft instrument manufacturing practice.

3.2. **Radio interference.** The instrument shall not be the source of objectionable interference, under operating conditions at any frequencies used on aircraft, either by ra-

¹ Copies may be obtained from the Society of Automotive Engineers, 29 West 39th St., New York, N. Y.

diation or feed-back, in radio sets installed in the same aircraft as the instrument.

3.3. **Identification.** The following information shall be legibly and permanently marked on the instrument or attached thereto:

- (a) Name of instrument.
- (b) SAE Spec. AS 397.
- (c) Rating (electrical, vacuum, etc.).
- (d) Manufacturer's part number.
- (e) Manufacturer's serial number or date of manufacture.
- (f) Manufacturer's name and/or trade mark.

3.4. **Environmental conditions.**

3.4.1. **Temperature.** The instrument shall function over the temperature range -30° C. to +50° C. and shall not be adversely affected by exposure to temperatures in the range -65° C. to +70° C.

3.4.2. **Humidity.** The instrument shall function and not be adversely affected when exposed to a relative humidity up to and including 95 percent at a temperature of approximately 32° C.

3.4.3. **Altitude.** The instrument shall function and not be adversely affected when subjected to a pressure range equivalent to -1,000 feet to +40,000 feet standard altitude.

3.4.4. **Vibration.** The instrument shall function and not be adversely affected when subjected to vibration of 0.005 inch maximum amplitude at frequencies of 150-3,000 cycles per minute. The instrument shall withstand vibration, at higher frequencies, having acceleration values not to exceed 0.8 g.

4. **Detailed requirements.**

4.1. **Indicating method.** One of the following methods of indication shall be employed:

Method I. Horizontal drum dial with fixed lubber's line. Graduations move to the right for right turns.

Method II. Rotating vertical dial with fixed lubber's line at the top. Dial rotates counterclockwise for right turns.

Method III. Rotating pointer with fixed graduated dial. Pointer rotates clockwise for right turns.

4.2. **Operating limits.** The instrument shall indicate throughout the 360-degree scale range, during dives, climbs or banks up to at least 55 degrees displacement from level flight.

4.3. **Dial markings.**

4.3.1. **Increments.** Degree graduations shall be provided at intervals not to exceed 5 degrees with major graduations at 10, 20, 30, etc., degrees and with legible numerals at intervals not greater than 30 degrees throughout the scale range of 360 degrees. In the numerical marking the last digit (zero) shall be omitted. (Thus, 6 at 60 degrees, 9 at 90 degrees, etc.)

4.3.2. **Visibility.** Index and dial markings shall be visible from any point within the frustum of a cone the side of which makes an angle of 30 degrees with the perpendicular to the dial and the small diameter of which is the aperture of the instrument case. At least two numerals shall be simultaneously visible.

4.3.3. **Finish.** Unless otherwise specified, luminescent material shall be applied to major graduations and numerals.

4.4. **Course setting provisions.** A means shall be provided for manually setting the directional indicator dial (or pointer) indication to any heading desired.

4.5. **Gyro caging provisions.** Unless the gyro assembly has unrestricted freedom of operation in the pitch and roll axes, means shall be provided for caging and relieving the gyro should it become upset by operation beyond its limits. A conspicuous warning device shall indicate when the instrument is caged, except when it is not possible to leave the instrument in caged condition.

4.6. **Power indication.** Suitable internal or external means shall be provided for

operating a device to indicate whether the instrument is receiving power.

5. Test conditions.

5.1. *Atmospheric conditions.* Unless otherwise specified, all tests required by this specification shall be made at an atmospheric pressure of approximately 29.92 inches of mercury and at an ambient temperature of approximately 22° C. When tests are made with the atmospheric pressure or the temperature substantially different from these values, allowance shall be made for the variation from the specified conditions.

5.2. *Vibration.* Unless otherwise specified, all tests for performance may be made with the instrument subjected to a vibration of 0.002 to 0.005 inch amplitude at a frequency of 1,500 to 2,000 cycles per minute. The term amplitude as used herein indicates the total displacement from positive maximum to negative maximum.

5.3. *Power conditions.* Unless otherwise specified, all tests for performance shall be conducted at the power rating recommended by the manufacturer.

6. *Individual performance tests.* All Type I and Type II instruments shall meet the requirements of the following individual tests where applicable.

6.1. Type I requirements.

6.1.1. *Starting.* The gyro rotor shall start to rotate and continue to run on a suction not to exceed 50 percent of rated value. Rated instrument performance speed shall be reached within two minutes after normal rated suction is applied.

6.1.2. *Roll, pitch and yaw.* The instrument shall be mounted on a test platform which is adjusted to oscillate in roll, pitch and yaw, with a total amplitude of 3 degrees about each axis, at a frequency of 5 to 7 oscillations per minute. With the platform level, and the gyro operating at equilibrium speed and uncaged, the dial (or pointer) reading shall be noted. The platform shall then be started in its roll, pitch and yaw movement. At the end of a ten minute period the oscillation shall be stopped, the platform realigned to its starting position, and the instrument dial (or pointer) reading noted. The amount of drift of the dial (or pointer) in either direction during the ten minute test period shall not exceed 4 degrees.

6.1.3. *Heading stability.* The instrument shall be mounted on a turn table, tilted 54 (±1) degrees from the vertical and the reading noted. The turn table shall be rotated one complete revolution about its vertical axis at 360 (±30) degrees per minute and the drift of the dial (or pointer) shall not exceed two degrees. The test shall be repeated rotating the turn table in the opposite direction.

6.2. Type II requirements.

6.2.1. *Starting.* The gyro rotor shall start to rotate and continue to operate at a speed sufficient for proper performance of the instrument on an applied voltage not to exceed 80 percent of the rated voltage. This speed shall be reached within two minutes after application of this voltage.

6.2.2. *Roll, pitch and yaw.* Same as for Type I.

6.2.3. *Heading stability.* Same as for Type I.

6.2.4. *Dielectric.* The instrument shall be subjected to a dielectric test with a R. M. S. voltage equivalent to five times operating voltage but at a commercial frequency applied between each terminal and the instrument case for a period of 5 seconds. The breakdown resistance shall not be less than 20 megohms at that voltage (A. C. or D. C. as applicable).

7. *Qualification tests.* As many instruments as appears necessary to demonstrate that all instruments will comply with the requirements of this section shall be subjected to the following additional tests:

7.1. *Low temperature operation.* The instrument shall be placed in a low tempera-

ture apparatus which will hold it in a level attitude. The instrument shall be subjected for a period of 2 hours to a temperature of -30° C. without operating. At the end of that period the instrument shall be started by application of rated power. The amount of drift of the dial (or pointer) in either direction during a 10-minute period shall not exceed 5 degrees.

7.2. *High temperature operation.* The foregoing test shall be repeated at a temperature of 50° C.

7.3. *Extreme temperature exposure.* The instrument shall first be subjected to the Roll, Pitch and Yaw Test specified in section 6 and shall meet the requirements of that test. The instrument shall then be subjected for a period of 24 hours to a temperature of -65° C. without operating. Upon completion of this exposure the instrument shall be returned to room temperature. After a period of not less than three hours the instrument shall be subjected for a period of 24 hours to a temperature of 70° C. without operating. Upon completion of this exposure the instrument shall be returned to room temperature. After a period of not less than three hours the instrument shall again be subjected to the Roll, Pitch and Yaw Test of section 6 and shall meet the requirements of that test. The instrument shall then be examined and shall not show evidence of damage as a result of exposure to the extreme temperatures specified herein.

7.4. *Magnetic effect.* The magnetic effect of the indicator shall be determined in terms of the deflection of a free magnet, approximately 1½ inches long, in a magnetic field with a horizontal intensity of 0.18 (±0.01) gauss when the indicator is held in various positions on an east-west line with its nearest part 5 inches from the center of the magnet. An aircraft compass with the compensating magnets removed therefrom may be used as the free magnet for this test. This test shall be made first with the instrument not operating and then shall be repeated with the instrument in normal operation. The maximum deflection of the magnet shall not exceed 2 degrees.

7.5. *Humidity.* The instrument shall be operated under the conditions specified in 3.4.2 for a period of 10 hours after which it shall meet the requirements of 6.1.2.

(i) *Exceptions.* (a) Section 6.2.4 Dielectric Test. Last sentence: "The breakdown resistance shall not be less than 5 megohms at that voltage (A. C. or D. C. as applicable)."

(b) Section 7.5 Humidity. External filters may be used when necessary in the humidity test.

(2) *Application.* (i) Non-magnetic direction indicators complying with the specifications appearing in this order are hereby approved for all aircraft. Non-magnetic direction indicators already approved by the Administrator may continue to be installed in aircraft:

(a) For which an application for original type certificate is made prior to the effective date of this order.

(b) The prototype of which is flown within one year after the effective date of this order, and

(c) The prototype of which is not flown within one year after the effective date of this order if due to causes beyond the applicant's control.

(ii) If an alteration involving a change in type or model of non-magnetic direction indicator is made within nine months after the effective date of this order, previously approved types of non-magnetic direction indicators may be installed. However, in any such change made after the nine month period, new types of non-

magnetic direction indicators installed in aircraft used in instrument flight shall meet the specifications contained herein.

(c) *Specific instructions.*—(1) *Marking.* In addition to the identification information required in the referenced specification, each non-magnetic direction indicator shall be permanently marked with the Technical Standard Order designation, CAA-TSO-C5b, to identify the non-magnetic direction indicator as meeting the requirements of this order in accordance with the manufacturers' statement of conformance outlined in subparagraph (5) of this paragraph. This identification will be accepted by the Civil Aeronautics Administration as evidence that the established minimum safety requirements for non-magnetic direction indicators have been met.

(2) *Data requirements.* None.

(3) *Effective date.* After May 1, 1949, specifications contained in this order will constitute the basis for Civil Aeronautics Administration approval of non-magnetic direction indicators for use in certificated aircraft used in instrument flight.

(4) *Deviations.* Requests for deviation from, or waiver of, the requirements of this order, which affect the basic airworthiness of the component, should be submitted for approval by the Chief, Aircraft Service, Office of Aviation Safety, Civil Aeronautics Administration. These requests should be addressed to the nearest Regional Office of the Civil Aeronautics Administration, Attention: Superintendent, Aircraft Branch.

(5) *Conformance.* (i) The manufacturer shall furnish to the Civil Aeronautics Administration, Aircraft Service, Attention: A-298, Washington 25, D. C., a written statement of conformance signed by a responsible official of his company, setting forth that the non-magnetic direction indicator to be produced by him meets the minimum safety requirements established in this order. Immediately thereafter distribution of the non-magnetic direction indicator conforming with the terms of this order may be started and continued.

(ii) The prescribed identification on the non-magnetic direction indicator does not relieve the aircraft manufacturer or owner of responsibility for the proper application of the non-magnetic direction indicator in his aircraft, nor waive any of the requirements concerning type certification of the aircraft in accordance with existing Civil Air Regulations.

(iii) If complaints of nonconformance with the requirements of this order are brought to the attention of the Civil Aeronautics Administration, and investigation indicates that such complaints are justified, the Administrator will take appropriate action to restrict the use of the product involved.

(iv) Copies of this Technical Standard Order and other Technical Standard Orders may be obtained from the Civil Aeronautics Administration, Aviation Information Staff, Washington 25, D. C.

[Supp. 6, 14 F. R. 3463]

§ 4b.691-5 *Technical Standard Order TSO-C6b: "Direction Indicator, Magnetic (Stabilized Type) (Stabilized Mag-*

netic Compass)" (CAA rules which apply to § 4b.691—(a) *Introduction*. Under section 601 of the Civil Aeronautics Act of 1938, as amended, and §§ 4a.31 and 4a.550 of this chapter, and §§ 4b.41 and 4b.691, the Administrator of Civil Aeronautics is authorized to adopt standards for stabilized magnetic direction indicators intended for use in civil aircraft. In adopting these standards, consideration has been given to existing Government and industry standards for stabilized magnetic direction indicators.

(b) *Directive*—(1) *Provision*. The performance requirements for stabilized magnetic direction indicators, as set forth in sections 6 and 7 of SAE Specification AS-399, Direction Indicator, Magnetic (Stabilized Type) dated August 1, 1947,¹ stated below, with the exceptions hereinafter noted, are hereby established as minimum safety performance standards for stabilized magnetic direction indicators intended for use in civil aircraft:

1. *Purpose*. To specify minimum requirements for gyroscopically stabilized (or integrated) magnetic direction indicators for use in aircraft, the operation of which may subject the instrument to the environmental conditions specified in section 3.4.

2. *Scope*. This specification covers minimum requirements for gyroscopically stabilized (or integrated) magnetic direction indicators for use in aircraft.

3. *General requirements*.

3.1. *Material and workmanship*.

3.1.1. *Materials*. Materials shall be of a quality which experience and/or tests have demonstrated to be suitable and dependable for use in aircraft instruments.

3.1.2. *Workmanship*. Workmanship shall be consistent with high-grade aircraft instrument manufacturing practice.

3.2. *Radio interference*. The instrument shall not be the source of objectionable interference, under operating conditions at any frequencies used on aircraft, either by radiation or feed-back, in radio sets installed in the same aircraft as the instrument.

3.3. *Identification*. The following information shall be legibly and permanently marked on each unit or attached thereto:

- (a) Name of instrument.
- (b) S. A. E. Spec. AS 399.
- (c) Rating (electrical, vacuum, etc.).
- (d) Manufacturer's part number.
- (e) Manufacturer's serial number or date of manufacture.
- (f) Manufacturer's name and/or trademark.

3.4. *Environmental conditions*. The following conditions have been established as design criteria only. Tests shall be conducted as specified in sections 5, 6 and 7.

3.4.1. *Temperature*. When installed in accordance with the instrument manufacturer's instructions the unit shall function over the range of ambient temperatures shown in column A below and shall not be adversely affected by exposure to the temperatures shown in column B below:

Instrument location	A	B
Heated areas (temperature controlled).....	-30° to 50° C.	-65° to 70° C.
Unheated areas (temperature uncontrolled).....	-55° to 70° C.	-65° to 70° C.

3.4.2. *Humidity*. The instrument shall function and not be adversely affected when exposed to a relative humidity up to and in-

cluding 95% at a temperature of approximately 32° C.

3.4.3. *Altitude*. The instrument shall function and not be adversely affected when subjected to a pressure and temperature range equivalent to -1,000 to +40,000 feet standard altitude, except as limited by application of section 3.4.1.

3.4.4. *Vibration*. When installed in accordance with the instrument manufacturer's instructions, the units shall function and shall not be adversely affected when subject to the following vibrations:

Type of instrument mounting	Cycles per minute ¹	Amplitude ¹	Maximum acceleration
Shock mounted panel instruments.....	500-3000	Inch 0.005	0.8 g
Unshock mounted panel instruments.....	500-3000	.010	1.3 g
Structure mounted instruments.....	500-3000	.030	3.8 g

¹ It is understood that the unit shall withstand vibration at higher frequencies, but the acceleration values need not exceed those shown above.

When specified by the purchaser for use in rotary wing aircraft, the frequency range shall be 150-3,000 cycles per minute.

4. *Detail requirements*.

4.1. *Indicating method*. One of the following methods of indication shall be employed:

Method I. Horizontal drum dial with fixed lubber's line. The graduations shall move to the right for right turns.

Method II. Rotating vertical dial with fixed lubber's line. Dial shall rotate counterclockwise for right turns.

Method III. Rotating pointer with fixed graduated dial. Pointer shall rotate clockwise for right turns. Dial position may be settable.

4.2. *Operating limits*. The instrument shall indicate magnetic heading throughout the 360 degree scale range, during dives, climbs or banks up to at least 60 degrees displacement from level flight.

4.3. *Dial markings*.

4.3.1. *Increments*. The indicators shall be provided with degree graduations at intervals not to exceed 5 degrees, with major graduations every 10 degrees and with numerals at intervals not greater than 30 degrees, except that the 0, 90, 180 and 270 degree positions shall be marked N, E, S and W respectively.

4.3.2. *Visibility*. Index and dial markings shall be visible from any point within the frustum of a cone the side of which makes an angle of 30 degrees with the perpendicular to the dial and the small diameter of which is the aperture of the instrument case. At least two numerals shall be simultaneously visible.

4.3.3. *Finish*. Unless otherwise specified, luminescent (self-activating) material shall be applied to major graduations, numerals and pointers.

4.4. *Power variation*. All units shall properly function with $\pm 15\%$ variation in D. C. voltage and/or $\pm 10\%$ variation in A. C. voltage and frequency, provided the A. C. voltage and frequency vary in the same direction.

4.5. *Compensation provisions*. Means shall, if necessary, be provided for compensating for semi-circular deviation. Compensating effect shall not exceed 30 degrees in each direction for each axis when adjusted for maximum effect.

4.6. *Gyro caging provisions*. Unless the gyro assembly has unrestricted freedom of operation in the pitch and roll axes, means shall be provided for caging and/or releveling the gyro. Means shall be provided to indicate when the gyro is caged, except when it is not possible to leave the gyro in caged condition.

4.7. *Synchronizing provisions*. Automatic or manual means shall be provided to bring the indicated heading into alignment with the magnetic heading. If manual synchronization is required, an indication of alignment shall be provided.

4.8. *Power indication*. Means shall be provided to permit the operation of a device to indicate whether the instrument is receiving power.

5. *Test conditions*.

5.1. *Atmospheric conditions*. Unless otherwise specified, all tests required by this specification shall be made at an atmospheric pressure of approximately 29.92 inches of mercury and at an ambient temperature of approximately 22° C. When tests are made with the atmospheric pressure or the temperature substantially different from these values, allowance shall be made for the variation from the specified conditions.

5.2. *Vibration (to minimize friction)*. Unless otherwise specified, all tests for performance may be made with the instrument subjected to a vibration of 0.002 to 0.005 inch amplitude at a frequency of 1,500 to 2,000 cycles per minute. The term amplitude as used herein indicates the total displacement from positive maximum to negative maximum.

5.3. *Power*. Unless otherwise specified, all tests for performance shall be conducted at a power rating recommended by the manufacturer.

5.4. *Magnetic field strength*. Unless otherwise specified, all tests required by this specification shall be made with a horizontal field strength of approximately 0.18 gauss and a vertical field strength of approximately 0.54 gauss, in the direction normal in the northern hemisphere. When tests are made with field strength values substantially different from these values, allowance shall be made for variations from the specified tolerances.

5.5. *Position*. Unless otherwise specified, all tests shall be made with indicators and transmitters in normal level position.

5.6. *Compensators*. Unless otherwise specified, all tests shall be made with magnetic compensators removed or adjusted to neutral position.

5.7. *Vibration stand*. For vibration tests a stand shall be used which will vibrate at any desired frequency between 500 and 3,000 cycles per minute and shall subject the instrument to vibration such that a point on the instrument case will describe, in a plane inclined 45 degrees to the horizontal plane, a circle, the diameter of which is equal to the amplitude specified herein.

6. *Individual performance requirements*. All instruments, or components of such, shall be subjected to whatever tests the manufacturer deems necessary to demonstrate specific compliance with this specification, including the following requirements where applicable.

6.1. *Starting*.

6.1.1. *Potential*. The gyro shall start to rotate and continue to run on application of 50 percent of rated suction for air operated instruments and 80 of rated voltage for electrically operated instruments.

6.1.2. *Operation interval*. Rated performance shall be obtained within 3 minutes after the application of rated power.

6.2. *Scale error*. When the magnetic-sensitive unit is placed on magnetic headings at 30 degree intervals, starting from North, the indicated headings shall correspond to actual magnetic headings within 4 degrees.

6.3. *Heeling*. When the instrument is tilted 10 degrees about the roll or pitch axis and rotated 360 degrees in azimuth in 30 degree increments, the indicated headings shall not differ from the indicated headings with the instrument in normal level position by more than 4 degrees. The instrument shall remain at each heading for 5 minutes before reading.

6.4. *Compensation*. With the instrument on N heading and the magnetic compensator

¹ Copies may be obtained from the Society of Automotive Engineers, 29 West 39th St., New York, N. Y.

adjusted for minimum effect, the scale error with compensator shall not differ from the scale error without compensator by more than 2 degrees. The range of adjustable compensation effect shall not exceed 30 degrees in each direction for each axis.

When the instrument is placed on any cardinal heading and the opposite axis compensator adjusted for maximum effect, the indicated heading shall not change more than 2 degrees.

6.5. *Dielectric.* The insulation shall be subjected to a dielectric test with an R. M. S. voltage at a commercial frequency applied for a period of five seconds equivalent to five times normal circuit operating voltage except where circuits include components for which such a test would be inappropriate the test voltage shall be 1.25 times normal circuit operating voltage. The insulation resistance shall not be less than 20 megohms at that voltage.

7. *Qualification tests.* As many instruments as deemed necessary to demonstrate that all instruments will comply with the requirements of this section shall be tested in accordance with the manufacturer's recommendations.

7.1. *Low temperature.* The instrument, or components, shall be subjected to the temperatures indicated in the following table in accordance with their location in the aircraft. After exposure to these temperatures for 5 hours, rated performance shall be obtained in 15 minutes after application of rated power using the magnetic field strength specified in section 5.4 except the field strength tolerance shall be $\pm 20\%$.

Instrument location:	Temperature
Heated area (temperature controlled)	-30° C.
Unheated area (temperature uncontrolled)	-55° C.

7.2. *High temperature.* The requirements of section 7.1 shall apply except that the exposure temperatures shall be 50° C. for heated areas and 70° C. for unheated areas and rated performance shall be obtained in 3 minutes after application of rated power.

7.3. *Extreme temperature exposure.* The instrument, or components, shall, after alternate exposures to ambient temperatures of -65° C. and 70° C. for periods of 24 hours each and a delay of 3 hours at room temperature following completion of the exposure, meet the requirements of sections 6.1 and 6.2. There shall be no evidence of damage as a result of exposure to the extreme temperatures specified herein.

7.4. *Magnetic effect.* The magnetic effect of the indicator shall be determined in terms of the deflection of a free magnet, approximately 1½ inches long, in a magnetic field with a horizontal intensity of 0.18 (± 0.01) gauss when the indicator is held in various positions on an east-west line with its nearest part 12 inches from the center of the magnet. This test shall first be made with the indicator not operating and then shall be repeated with the indicator in normal operation. The maximum deflection of the free magnet shall not exceed 5 degrees for any pointer or dial position.

7.5. *Humidity.* The instrument shall be operated under the extreme condition specified in section 3.4.2 for a period of 10 hours after which it shall meet the requirements of sections 6.1 and 6.2.

7.6. *Vibration.* The instrument(s) shall be subjected, while in normal operation, to vibration with an amplitude of 0.010 inch at frequencies from 1,000 to 3,000 cycles per minute in order to determine whether the natural frequency of the instrument(s) is in this frequency range. While the instrument is being vibrated, the maximum range of the indicator dial (or pointer) oscillation shall not exceed 2 degrees and the maximum difference in mean indicated heading with and without vibration shall not exceed 2 degrees. After 3 hours exposure to vibration ampli-

tudes as specified in section 3.4.4 and at the natural frequency of between 1,000 and 3,000 c. p. m., otherwise at 2,000 c. p. m., the instrument(s) shall meet the requirements of section 6.1, 6.2 and 6.3. Those components normally intended for shock mounting shall be subjected to a vibration having only 0.005 inch amplitude. No damage shall be evident after this test.

7.7. *Field strength variation.* With transmitter at a total field of 0.57 ± 0.02 gauss at a dip angle of 72 degrees ± 1 degree and the compass at a null, the null shall not vary more than ± 2 degrees when the dip angle is changed to 80 degrees ± 1 degree.

7.8. *Turn error.* The scale error resulting from a coordinated turn of 180 degrees in one minute at a true air speed of 180 miles per hour shall be within 2 degrees 2 minutes after resumption of straight and level flight. The error shall have been obtained from a turn which was begun from an easterly heading.

(1) *Exceptions.* (a) Section 6.5 Dielectric Test. Last sentence: "The breakdown resistance shall not be less than 5 megohms at that voltage (A. C. or D. C. as applicable)."

(2) *Application.* (i) Stabilized magnetic direction indicators complying with the specifications appearing in this order are hereby approved for all aircraft. Stabilized magnetic direction indicators already approved by the Administrator may continue to be installed in aircraft:

(a) For which an application for original type certificate is made prior to the effective date of this order,

(b) The prototype of which is flown within one year after the effective date of this order, and

(c) The prototype of which is not flown within one year after the effective date of this order if due to causes beyond the applicant's control.

(ii) If an alteration involving a change in type or model of stabilized magnetic direction indicator is made within nine months after the effective date of this order, previously approved types of stabilized magnetic direction indicators may be installed. However, in any such change made after the nine month period, new types of stabilized magnetic direction indicators installed in aircraft used in instrument flight shall meet the specifications contained herein.

(c) *Specific instructions.*—(1) *Marking.* In addition to the identification information required in the referenced specification, each stabilized magnetic direction indicator shall be permanently marked with the Technical Standard Order designation, CAA-TSO-C6b, to identify the stabilized magnetic direction indicator as meeting the requirements of this order in accordance with the manufacturers' statement of conformance outlined in subparagraph (5) of this paragraph. This identification will be accepted by the Civil Aeronautics Administration as evidence that the established minimum safety requirements for stabilized magnetic direction indicators have been met.

(2) *Data requirements.* None.

(3) *Effective date.* After May 1, 1949, specifications contained in this order will constitute the basis for Civil Aeronautics Administration approval of stabilized magnetic direction indicators for use in certificated aircraft used in instrument flight.

(4) *Deviations.* Requests for deviation from, or waiver of, the requirements of this order, which affect the basic airworthiness of the component, should be submitted for approval by the Chief, Aircraft Service, Office of Aviation Safety, Civil Aeronautics Administration. These requests should be addressed to the nearest Regional Office of the Civil Aeronautics Administration, Attention: Superintendent, Aircraft Branch.

(5) *Conformance.* (1) The manufacturer shall furnish to the Civil Aeronautics Administration, Aircraft Service, Attention: A-298, Washington 25, D. C., a written statement of conformance signed by a responsible official of his company, setting forth that the stabilized magnetic direction indicator to be produced by him meets the minimum safety requirements established in this order. Immediately thereafter distribution of the stabilized magnetic direction indicator conforming with the terms of this order may be started and continued.

(ii) The prescribed identification on the stabilized magnetic direction indicator does not relieve the aircraft manufacturer or owner of responsibility for the proper application of the stabilized magnetic direction indicator in his aircraft, nor waive any of the requirements concerning type certification of the aircraft in accordance with existing Civil Air Regulations.

(iii) If complaints of nonconformance with the requirements of this order are brought to the attention of the Civil Aeronautics Administration, and investigation indicates that such complaints are justified, the Administrator will take appropriate action to restrict the use of the product involved.

(iv) Copies of this Technical Standard Order and other Technical Standard Orders may be obtained from the Civil Aeronautics Administration, Aviation Information Staff, Washington 25, D. C. [Supp. 6, 14 F. R. 3464]

§ 4b.691-6 *Technical Standard Order TSO-C7a: "Direction Indicator, Magnetic, Nonstabilized Type (Magnetic Compass)"* (CAA rules which apply to § 4b.691)—(a) *Introduction* (1) Nonstabilized magnetic direction indicators are in the class of aircraft components which the Administrator of Civil Aeronautics is authorized to approve in accordance with Parts 4a and 4b of this subchapter.

(2) This Technical Standard Order is intended to serve as a criterion by which the product manufacturer can obtain Civil Aeronautics Administration approval of his nonstabilized magnetic direction indicator.

(3) In the establishment of this Technical Standard Order, consideration has been given to existing Government and industry standards for nonstabilized magnetic direction indicators for the purpose of adopting the performance requirements of one of the recognized aeronautical standards as the minimum safety requirements for nonstabilized magnetic direction indicators which are intended for use in civil aircraft. The specification of the Society of Automotive Engineers for nonstabilized magnetic direction indicators contains such requirements.

(b) Directive.

(1) *Provision.* Pursuant to §§3.31, 3.655, 4a.31, 4a.535, 4b.41, and 4b.691 of this subchapter, which authorize the Administrator to approve aircraft equipment, the performance requirements for nonstabilized magnetic direction indicators as set forth in SAE Specification AS-398, Direction Indicator, Magnetic, Nonstabilized Type, dated July 1, 1947,¹ stated below, are hereby established as minimum safety requirements for nonstabilized magnetic direction indicators which are intended for use in civil aircraft:

1. *Purpose.* To specify minimum requirements for non-stabilized magnetic direction indicators for use in aircraft, the operation of which may subject the instrument to the environmental conditions specified in section 3.4.

2. *Scope.* This specification covers two basic types as follows:

Type I. Direct reading.

Type II. Remote indicating.

3. *General requirements.*3.1. *Material and workmanship.*

3.1.1. *Materials.* Materials shall be of a quality which experience and/or tests have demonstrated to be suitable and dependable for use in aircraft instruments.

3.1.2. *Workmanship.* Workmanship shall be consistent with high-grade aircraft instrument manufacturing practice.

3.2. *Radio interference.* The instrument shall not be the source of objectionable interference, under operating conditions at any frequencies used on aircraft, either by radiation or feed-back, in radio sets installed in the same aircraft as the instrument.

3.3. *Identification.* The following information shall be legible and permanently marked on each unit or attached thereto:

- (a) Name of instrument.
- (b) SAE specification AS 398.
- (c) Rating (electrical, vacuum, etc.).
- (d) Manufacturer's part number.
- (e) Manufacturer's serial number or date of manufacture.
- (f) Manufacturer's name and/or trademark.

3.4. *Environmental conditions.* The following conditions have been established as design criteria only. Tests shall be conducted as specified in sections 5, 6 and 7.

3.4.1. *Temperature.* When installed in accordance with the instrument manufacturer's instructions, the instrument shall function over the range of ambient temperature indicated below and shall not be adversely affected by exposure to temperature in the range -65° C. to +70° C.

Type I indicator----- -30° C. to +50° C.
Type II indicator----- -30° C. to +50° C.
Type II transmitter----- -55° C. to +70° C.

3.4.2. *Humidity.* The instrument shall function and not be adversely affected when exposed to a relative humidity up to and including 95% at a temperature of approximately 32° C.

3.4.3. *Altitude.* The instrument shall function and not be adversely affected when subjected to a pressure range equivalent to -1,000 to +40,000 feet standard altitude.

3.4.4. *Vibration.* When installed in accordance with the instrument manufacturer's instructions, the instrument shall function and shall not be adversely affected when subjected to the following vibration:

Unit	Cycles per minute	Amplitude	Maximum acceleration
Type I indicator-----	500-3000	Inch 0.010	1.3 g
Type II indicator-----	500-3000	.010	1.3 g
Type II transmitter-----	500-3000	.030	3.8 g

NOTE: It is understood that the instrument shall withstand vibration at higher frequencies, but the acceleration values need not exceed those shown above.

When specified by the purchaser for use in rotary wing aircraft the frequency range shall be 150-3,000 cycles per minute.

4. *Detail requirements.*

4.1. *Indicating method.* One of the following methods of indication shall be employed:

Method I. Horizontal drum dial with fixed lubber's line. Graduations move to the right for right turns.

Method II. Rotating vertical dial with fixed lubber's line. Dial rotates counterclockwise for right turns.

Method III. Rotating pointer with fixed graduated dial. Pointer rotates clockwise for right turns. Dial position may be settable.

4.2. *Operating limits.* During straight flight the instrument shall indicate magnetic headings, throughout the 360 degree scale range, during dives, climbs or banks up to at least 20 degrees displacement from level flight.

4.3. *Dial markings.*

4.3.1. *Increments.* The indicators shall be provided with degree graduations at intervals not to exceed 5 degrees, with major graduations every 10 degrees and with numerical markings at intervals not greater than 30 degrees, except that the 0, 90, 180, and 270 degree positions shall be marked N, E, S, and W respectively.

4.3.2. *Visibility.* Index and dial markings shall be visible from any point within the frustum of a cone the side of which makes an angle of 30 degrees with the perpendicular to the dial and the small diameter of which is the aperture of the instrument case. At least two numerals shall be simultaneously visible.

4.3.3. *Finish.* Unless otherwise specified, luminescent material (self activating) shall be applied to major graduations, numerals and pointers.

4.4. *Power variations.* All units shall properly function with $\pm 15\%$ variation in D. C. voltage and/or $\pm 10\%$ variation in A. C. voltage and frequency, provided the A. C. voltage and frequency vary in the same direction.

4.5. *Compensation provisions.* Means shall be provided for compensating for semi-circular deviation. Compensating effect shall be between 15 and 30 degrees in each direction for each axis when adjusted for maximum effect.

5. *Test conditions.*

5.1. *Atmospheric conditions.* Unless otherwise specified, all tests required by this specification shall be made at an atmospheric pressure of approximately 29.92 inches of mercury and at an ambient temperature of approximately 22° C. When tests are made with the atmospheric pressure or the temperature substantially different from these values, allowance shall be made for the variation from the specified conditions.

5.2. *Vibration (to minimize friction).* Unless otherwise specified all test for performance may be made with the instrument subjected to a vibration of 0.002 to 0.005 inch amplitude at a frequency of 1,500 to 2,000 cycles per minute. The term amplitude as used herein indicates the total displacement from positive maximum to negative maximum.

5.3. *Power.* Unless otherwise specified, all tests for performance shall be conducted at

the power rating recommended by the manufacturer.

5.4. *Magnetic field strength.* Unless otherwise specified all tests required by this specification shall be made with a horizontal field strength of approximately 0.18 gauss and a vertical field strength of approximately 0.54 gauss, in the direction normal in the northern hemisphere. When tests are made with field strength values substantially different from these values, allowances shall be made for variations from the specified tolerances.

5.5. *Position.* Unless otherwise specified all tests shall be made with indicators and transmitters in normal level position.

5.6. *Compensators.* Unless otherwise specified all tests shall be made with compensators removed or adjusted to neutral position.

5.7. *Vibration stand.* For vibration tests a stand shall be used which will vibrate at any desired frequency between 500 and 3,000 cycles per minute and shall subject the instrument to vibration such that a point on the instrument case will describe, in a plane inclined 45 degrees to the horizontal plane, a circle, the diameter of which is equal to the amplitude specified herein.

6. *Individual performance requirements.* All instruments, or components of such, shall be subjected to whatever tests the manufacturer thereof deems necessary to demonstrate specific compliance with this specification including the following requirements where applicable.

6.1. *Leakage.* Liquid-filled indicators or transmitters shall not show evidence of leakage after having been placed in a bell jar and subjected to a pressure equivalent to 40,000 feet standard altitude for a period of 1 hour.

6.2. *Scale error.* When the magnetic-sensitive unit is placed on magnetic headings at 30 degree intervals starting from North the indicated headings shall correspond to actual magnetic headings within 4 degrees.

6.3. *Friction.* When the magnetic element has been deflected 5 degrees first to right and then to left, from its equilibrium position and then allowed to come to rest, the difference between the two indicator readings at rest shall not exceed 1 degree.

6.4. *Damping.* When the magnetic element has been deflected 30 degrees, first to the right and to the left, from its equilibrium position, the time required for the indicator dial (or pointer) to pass through the 25 degree angle toward the original indicated heading shall not exceed 5.0 seconds or be less than 1.0 second. The maximum overswing past the original indicated heading shall not exceed 15 degrees.

6.5. *Heeling error.* When the magnetic-sensitive unit is tilted 20 degrees from the normal level position and magnetic element shall be free to rotate through 360 degrees. When the unit is tilted 10 degrees the indicated heading shall not differ from the indicated heading with the magnetic-sensitive unit in normal level position by more than 4 degrees. The indicator dial (or pointer) shall still be visible as specified in section 4.3.2.

6.6. *Swirl.* When the magnetic-sensitive unit is tilted 20 degrees from normal and rotated in azimuth, at a rate of 30 degrees per second, through 360 degrees, stopping at N, S, E, and W indication, the overswing of the indicator dial (or pointer) at each of these points shall not exceed 6 degrees.

6.7. *Compensation.* With the magnetic-sensitive unit on N heading and the compensator adjusted for minimum effect, the scale error with the compensator shall not differ from the scale error without compensator by more than 2 degrees. The range of adjustable compensation effect shall be between 15 and 30 degrees in each direction for each axis.

When the magnetic-sensitive unit is placed on any cardinal heading and the opposite

¹ Copies may be obtained from the Society of Automotive Engineers, 29 West 39th St., New York, N. Y.

axis compensator adjusted for maximum effect the indicated heading shall not change more than 2 degrees.

6.8. *Dielectric.* The insulation shall be subjected to a dielectric test with an R. M. S. voltage at a commercial frequency applied for a period of five seconds equivalent to five times normal circuit operating voltage except where circuits include components for which such a test would be inappropriate the test voltage shall be 1.25 times normal circuit operating voltage. The insulation resistance shall not be less than 20 megohms at that voltage.

7. *Qualification tests.* As many instruments as deemed necessary to demonstrate that all instruments will comply with the requirements of this section shall be tested in accordance with the manufacturer's recommendations.

7.1. *Low temperature.* The instruments, or components, shall be subjected to the temperatures indicated in the following table in accordance with their location in the aircraft. After exposure to these temperatures for 5 hours, rated performance shall be obtained in 15 minutes after application of rated power using the magnetic field strength specified in section 5.4 except the field strength tolerance shall be $\pm 20\%$.

Instrument location:	Temperature
Heated area (temperature controlled)	-30° C.
Unheated area (temperature uncontrolled)	-55° C.

7.2. *High temperature.* The requirements of section 7.1 shall apply except that the exposure temperatures shall be 50° C. for heated areas and 70° C. for unheated areas and rated performance shall be obtained in 3 minutes after application of rated power.

7.3. *Extreme temperature exposure.* The instrument, or components, shall, after alternate exposures to ambient temperatures of -65° C. and 70° C. for periods of 24 hours each and a delay of 3 hours at room temperature following completion of the exposure, meet the requirements of section 6.1 and 6.2. There shall be no evidence of damage as a result of exposure to the extreme temperatures specified herein.

7.4. *Magnetic effect.* The magnetic effect of the Type II indicator shall be determined in terms of the deflection of a free magnet, approximately 1½ inches long, in a magnetic field with a horizontal intensity of 0.18 (± 0.01) gauss when the indicator is held in various positions on an east-west line with its nearest part 5 inches from the center of the magnet. This test shall first be made with the indicator not operating and then shall be repeated with the indicator in normal operation. The maximum deflection of the free magnet shall not exceed 2 degrees for any pointer or dial position.

7.5. *Humidity.* The instrument shall be operated under the extreme conditions specified in section 3.4.2 for a period of 10 hours after which it shall meet the requirements of sections 6.2 and 6.3.

7.6. *Vibration.* The instrument(s) shall be subjected, while in normal operation to vibration with an amplitude of 0.010 inch at frequencies from 1,000 to 3,000 cycles per minute in order to determine whether the natural frequency of the instrument(s) is in this frequency range. While the instrument is being vibrated, the maximum range of the indicator dial (or pointer) oscillation shall not exceed 3 degrees, and the maximum difference in mean indicated heading with and without vibration, shall not exceed 3 degrees. After 3 hours exposure to vibration amplitudes as specified in section 3.4.4 and at the natural frequency if between 1,000 and 3,000 c. p. m., otherwise at 2,000 c. p. m., the instrument(s) shall meet the requirements of section 6.1, 6.2 and 6.3. Those components normally intended for shock mounting shall be subjected to a vibra-

tion having only 0.005 inch amplitude. No damage shall be evident after this test.

(2) *Application.* (i) Nonstabilized magnetic direction indicators complying with the specifications appearing in this Technical Standard Order are hereby approved for all aircraft. Nonstabilized magnetic direction indicators already approved by the Administrator may continue to be installed in aircraft:

(a) For which an application for original type certificate is made prior to the effective date of this order.

(b) The prototype of which is flown within 1 year after the effective date of this order, and

(c) The prototype of which is not flown within 1 year after the effective date of this order if due to causes beyond the applicant's control.

(ii) If a major change is made in the installation within 9 months after the effective date of this order involving a change in type or model of nonstabilized magnetic direction indicator, previously approved types of nonstabilized magnetic direction indicators may be installed. However, in any such change made after the 9-month period, new types of nonstabilized magnetic direction indicators installed in aircraft used in instrument flight shall meet the specifications contained herein.

(c) *Specific instructions.*

(1) *Marking.* In addition to the identification information required in the referenced specification, each nonstabilized magnetic direction indicator shall be permanently marked with the Technical Standard Order designation "CAA-TSO-C7" to identify nonstabilized magnetic direction indicator as meeting the requirements of this order in accordance with the manufacturers' statement of conformance outlined below. This identification will be accepted by the Civil Aeronautics Administration as evidence that the established minimum safe requirements for nonstabilized magnetic direction indicator have been met.

(2) *Data requirements.* None.

(3) *Effective date.* After July 1, 1948, specifications contained in the Technical Standard Order will constitute the basis for Civil Aeronautics Administration approval of nonstabilized magnetic direction indicators for use in certificated aircraft used in instrument flight.

(4) *Deviations.* Requests for deviation from, or waiver of, the requirements of this order, which affect the basic airworthiness of the component, should be submitted for approval by the Director, Aircraft and Components Service, Office of Safety Regulation, Civil Aeronautics Administration. These requests should be addressed to the nearest regional office of the Civil Aeronautics Administration, Attn: Superintendent, Aircraft and Components Branch.

(5) *Conformance.* (i) The manufacturer shall furnish to the CAA, Aircraft and Components Service, A-298, Washington 25, D. C., a written statement of conformance signed by a responsible official of his company, setting forth that the nonstabilized magnetic direction indicator to be produced by him meets the minimum safety requirements established in this order. Immediately thereafter distribution of the nonstabilized

magnetic direction indicator conforming with the terms of this order may be started and continued.

(ii) The prescribed identification on the nonstabilized magnetic direction indicator does not relieve the aircraft manufacturer or owner of responsibility for the proper application of the nonstabilized magnetic direction indicator in his aircraft, nor waive any of the requirements concerning type certification of the aircraft in accordance with existing Civil Air Regulations.

(iii) If complaints of nonconformance with the requirements of this order are brought to the attention of the Civil Aeronautics Administration, and investigation indicates that such complaints are justified, the Administrator will take appropriate action to restrict the use of the product involved.

(iv) Copies of this Technical Standard Order and other Technical Standard Orders may be obtained from the Civil Aeronautics Administration, Aviation Information Staff, Washington 25, D. C.

[13 F. R. 3852, 7731]

§ 4b.691-7 *Technical Standard Order TSO-C8a: "Climb Indicator, Pressure Actuated (Vertical Speed Indicator)" (CAA rules which apply to § 4b.691)*

(a) *Introduction.* (1) Climb indicators are in the class of aircraft components which the Administrator of Civil Aeronautics is authorized to approve in accordance with Parts 4a and 4b of this subchapter.

(2) This Technical Standard Order is intended to serve as a criterion by which the product manufacturer can obtain Civil Aeronautics Administration approval of his climb indicator.

(3) In the establishment of this Technical Standard Order, consideration has been given to existing Government and industry standards for climb indicators for the purpose of adopting the performance requirements of one of the recognized aeronautical standards as the minimum safety requirements for climb indicators which are intended for use in civil aircraft. The specification of the Society of Automotive Engineers for climb indicators contains such requirements.

(b) *Directive.*

(1) *Provision.* Pursuant to §§ 4a.31, 4a.535, 4a.550, 4b.41, and 4b.691 of this subchapter, which authorize the Administrator to approve aircraft equipment, the performance requirements for climb indicators as set forth in SAE Specification AS-394, Climb Indicator, dated August 1, 1947,¹ stated below, are hereby established as minimum safety requirements for climb indicators which are intended for use in civil aircraft:

1. *Purpose.* To specify minimum requirements for pressure actuated climb indicators for use in aircraft, the operation of which may subject the instrument to environmental conditions specified in section 3.4.

2. *Scope.* This specification covers three types as follows:

Type I. Range 0-2,000 feet per minute climb and descent.

Type II. Range 0-4,000 feet per minute climb and descent.

¹ Copies may be obtained from the Society of Automotive Engineers, 29 West 39th St., New York, N. Y.

Type III. Range 0-6,000 feet per minute climb and descent.

3. General requirements.

3.1. Materials and workmanship.

3.1.1. *Materials.* Materials shall be of a quality which experience or tests have demonstrated to be suitable and dependable for use in aircraft instruments.

3.1.2. *Workmanship.* Workmanship shall be consistent with high-grade aircraft instrument manufacturing practice.

3.2. *Identification.* The following information shall be legibly and permanently marked on the units or attached thereto:

- (a) Name of instrument.
- (b) SAE Spec. 394.
- (c) Manufacturer's part number.
- (d) Manufacturer's serial number or date of manufacture.
- (e) Manufacturer's name and/or trademark.

3.3. *Environmental conditions.* The following conditions have been established as design criteria only. Tests shall be conducted as specified in sections 5, 6, and 7.

3.3.1. *Temperature.* When the instruments are mounted in accordance with manufacturer's instructions, they shall function over the range of ambient temperatures of -30° C. to 50° C. and shall not be adversely affected by exposure to temperatures of -65° C. to 70° C.

3.3.2. *Humidity.* The units shall function and not be adversely affected when exposed to a relative humidity up to and including 95 percent at approximately 32° C.

3.3.3. *Vibration.* When the instruments are mounted in accordance with manufacturer's instructions, they shall function and shall not be adversely affected when subjected to the following vibration.

Frequency: 500-3,000 cycles per minute.

Amplitude: 0.010 inch.

Maximum acceleration 0.8 g.

Note: It is understood that the units shall withstand vibration at higher frequencies but the acceleration values need not exceed that shown above.

When specified by the purchaser for use in rotary wing aircraft, the frequency range shall be 150-3,000 cycles per minute.

3.3.4. *Altitude.* The units shall function and not be adversely affected when subjected to a pressure and temperature range equivalent to an altitude range of -1,000 feet to +50,000 feet except that the instrument temperature shall not be lower than -30° C.

4. General requirements.

4.1. *Indicating method.* Ascent shall be indicated by a clockwise rotation of the pointer from the zero at the 9 o'clock position. Descent shall be indicated by a counterclockwise rotation. Stops shall be incorporated to limit the pointer movement to not more than 178 degrees in each direction from zero.

4.2. Dial markings.

4.2.1. *Increments.* Markings may be provided as follows:

Type I. Markings at 100 ft/min intervals with major graduations at 500 ft/min intervals.

Types II and III. Markings at 100 ft/min intervals up to 2,000 ft/min with major graduations at 500 ft/min intervals.

4.2.2. *Finish.* Unless otherwise specified, luminescent material (self-activating) shall be applied to the pointer, major graduations and numerals.

4.2.3. *Name.* Instrument name or function it measures may be legibly indicated in the same finish as applied to the major graduations and numerals.

4.2.4. *Visibility.* Pointer and dial markings shall be visible from any point within the frustum of a cone, the side of which makes an angle of 30 degrees with the perpendicular to the dial and the small diameter of which is the aperture of the instrument case. The distance between the dial and the cover glass shall be a practical mini-

mum and shall not exceed 0.187 of an inch.

4.3. *Zero setting system.* If means for manually setting the pointer at zero is provided, it shall not be accessible in flight.

5. Test conditions.

5.1. *Atmospheric conditions.* Unless otherwise specified, all tests required by this specification shall be made at an atmospheric pressure of approximately 29.92 inches of mercury and at a temperature of approximately 22° C. When tests are made with the atmospheric pressure or the temperature substantially different from these values, allowance shall be made for the variation from the specified condition.

5.2. *Vibration (to minimize friction).* Unless otherwise specified, all tests for performance may be made with the instrument subjected to a vibration of 0.002 to 0.005 inch amplitude at a frequency of 1,500 to 2,000 cycles per minute. The term amplitude as used herein indicates the total displacement from positive maximum to negative maximum.

5.3. *Vibration stand.* A vibration stand shall be used which will vibrate at any desired frequency between 500 and 3,000 cycles per minute and shall subject the instrument to vibration such that a point on the instrument case will describe, in a plane inclined 45 degrees to the horizontal, a circle, the diameter of which is equal to the amplitude specified herein.

6. *Individual performance requirements.* All instruments shall be subjected to whatever tests the manufacturer deems necessary to demonstrate specific compliance with this specification including the following requirements where applicable.

6.1. *Zero setting range.* The range of movement of the pointer by means of the zero adjustment shall not be less than 400 feet per minute for the "Up" and "Down" position.

6.2. *Calibration.* When subjected to the rates of change of pressure indicated in Table I for the altitude intervals shown, the errors shall not exceed the tolerances specified.

6.3. *Leak.* A suction of 15 inches of mercury and a pressure of 10 inches of mercury shall not change by more than 0.1 inch of mercury in 10 seconds at each condition.

6.4. *Position error.* The change in pointer indication with change in instrument position shall not exceed 50 feet per minute.

7. *Qualification tests.* As many instruments as deemed necessary, to demonstrate that all instruments will comply with the requirements of this section, shall be tested in accordance with the manufacturers' recommendations.

7.1. *Low temperature.* The instrument shall be exposed to a temperature of -30° C. for 3 hours and while at this temperature shall be subjected to the rates of change of pressure indicated in Table II for the altitude intervals shown. The errors shall not exceed the tolerances specified in Table II.

7.2. *Extreme temperature exposure.* The instrument shall, after alternate exposures to ambient temperatures of -65° C. and +70° C. for periods of 24 hours each and delay of 3 hours at room temperature following completion of the exposure, meet the requirements of sections 6.2 and 6.3. There shall be no evidence of damage as a result of exposure to the extreme temperatures specified herein.

7.3. *Vibration.* The instrument shall be vibrated at 500 cycles per minute so that a point on the case will describe a circle of 0.003-0.005 inch diameter. The frequency shall be slowly increased to 3,000 cycles per minute and then slowly decreased to 500 cycles per minute, to determine whether the natural frequency of the instrument is in this range. The drift of the pointer shall not exceed 50 feet per minute and it shall not oscillate more than 50 feet per minute. After three hours exposure to the vibration amplitude specified in section 3.3.3 and at the natural frequency (if between 500 and

3,000 cycles per minute) or at 2,000 cycles per minute the instrument shall meet the requirements of section 6. No damage shall be evident after this test.

7.4. *Lag.* The natural lag of the instrument when checked between the following points shall be between 6 and 15 seconds.

Type I. 1,800-200 feet per minute.

Types II and III. 2,000-200 feet per minute.

7.5. *Overpressure.* After subjecting the instrument to rates of 20,000 feet per minute climb and 30,000 feet per minute descent, the pointer shall return to its original indication within 100 feet per minute.

7.6. *Magnetic effect.* The magnetic effect of the instrument shall be determined in terms of the deflection of a free magnet, ap-

TABLE I—CALIBRATION (REFERENCE SECTION 6)

TYPE I (RANGE 0-2,000 FEET PER MINUTE)

Standard altitude test interval (feet)	Test point ascent and descent (feet per minute)	Tolerance (feet per minute)

Standard altitude test interval (feet)	Test point ascent and descent (feet per minute)	Tolerance (feet per minute)
Between 2,000 and 4,000....	1,500	200
Between 28,000 and 30,000..	1,500	250

TYPE II-III (RANGE 0-4,000 AND 0-6,000 FEET PER MINUTE)

Between 2,000 and 4,000....	2,000 4,000	300 400
Between 28,000 and 30,000..	2,000 4,000	300 400

² Test point for Type II.

proximately 1½ inches long, in a magnetic field with a horizontal intensity of 0.18 ± 0.01 gauss, when the indicator is held in various positions on an east-west line with its nearest part five inches from the center of the magnet. (An aircraft compass with the compensating magnets removed therefrom may be used as the free magnet for this test.) The maximum deflection of the magnet shall not exceed one degree for any pointer deflection.

7.7. *Humidity.* After being subjected to the extreme conditions of section 3.3.2 for 10 hours, the instrument shall meet the requirements of section 6.

(2) *Application.* (1) Climb indicators complying with the specifications appearing in this Technical Standard Order are hereby approved for all aircraft. Climb indicators already approved by the Administrator may continue to be installed in aircraft:

(a) For which an application for original type certificate is made prior to the effective date of this order.

(b) The prototype of which is flown within 1 year after the effective date of this order, and

(c) The prototype of which is not flown within 1 year after the effective date of this order if due to causes beyond the applicant's control.

(ii) If a major change is made in the installation within 9 months after the effective date of this order involving a change in type or model of climb indicator, previously approved types of climb indicators may be installed. However, in any such change made after the 9-month period, new types of climb indicators installed in aircraft used in instrument flight shall meet the specifications contained herein.

(c) *Specific instructions.*

(1) *Marking.* In addition to the identification information required in the referenced specification, each climb indicator shall be permanently marked with the Technical Standard Order designation "CAA-TSO-C8" to identify the climb indicator as meeting the requirements of this order in accordance with the manufacturer's statement of conformance outlined below. This identification will be accepted by the Civil Aeronautics Administration as evidence that the established minimum safety requirements for climb indicators have been met.

(2) *Data requirements.* None.

(3) *Effective date.* After July 1, 1948, specifications contained in this Technical Standard Order will constitute the basis for Civil Aeronautics Administration approval of climb indicators for use in certificated aircraft used in instrument flight.

(4) *Deviations.* Requests for deviation from or waiver of, the requirements of this order, which affect the basic airworthiness of the component, should be submitted for approval by the Director, Aircraft and Components Service, Office of Safety Regulation, Civil Aeronautics Administration. These requests should be addressed to the nearest regional office of the Civil Aeronautics Administration, Attn: Superintendent, Aircraft and Components Branch.

(5) *Conformance.* (i) The manufacturer shall furnish to the CAA, Aircraft and Components Service, A-298, Washington 25, D. C., a written statement of conformance signed by a responsible official of his company, setting forth that the climb indicator to be produced by him meets the minimum safety requirements established in this order. Immediately thereafter distribution of the climb indicator conforming with the terms of this order may be started and continued.

(ii) The prescribed identification on the climb indicator does not relieve the aircraft manufacturer or owner of responsibility for the proper application of the climb indicator in his aircraft, nor waive any of the requirements concerning type certification of the aircraft in accordance with existing Civil Air Regulations.

(iii) If complaints of nonconformance with the requirements of this order are brought to the attention of the Civil

Aeronautics Administration, and investigation indicates that such complaints are justified, the Administrator will take appropriate action to restrict the use of the product involved.

(iv) Copies of this Technical Standard Order and other Technical Standard Orders may be obtained from the Civil Aeronautics Administration, Aviation Information Staff, Washington 25, D. C.

[13 F. R. 3853]

§ 4b.691-8 *Technical Standard Order TSO-C10a: "Altimeter, Pressure Actuated, Sensitive Type" (CAA rules which apply to § 4b.691)—(a) Introduction.* Under section 601 of the Civil Aeronautics Act of 1938, as amended, and §§ 3.31, 3.655, 4a.31, 4a.535, 4a.550, 4b.41, 4b.691, 6.6, and 6.52 of this chapter, the Administrator of Civil Aeronautics is authorized to adopt standards for sensitive altimeters intended for use in civil aircraft. In adopting these standards, consideration has been given to existing Government and industry standards for sensitive altimeters.

(b) *Directive — (1) Provision.* The performance requirements for sensitive altimeters, as set forth in sections 6 and 7 of SAE Specification AS-392A, Altimeters, Pressure Actuated, Sensitive Type revised February 1, 1949,¹ stated below, are hereby established as minimum safety performance standards for sensitive altimeters intended for use in civil aircraft:

1. *Purpose.* To specify minimum requirements for Pressure Actuated Sensitive Altimeters for use in aircraft, the operation of which may subject the instrument to the environmental conditions specified in section 3.3.

2. *Scope.* This Aeronautical Standard covers two basic types of instruments as follows:

Type I: Range 35,000 feet. Barometric pressure. Scale range at least 28.1-30.99 inches of mercury (946-1,049 millibars). May include markers working in conjunction with the barometric pressure scale to indicate pressure-altitude.

Type II: Range 50,000 feet. Barometric pressure. Scale range at least 28.1-30.99 inches of mercury (946-1,049 millibars). May include markers working in conjunction with the barometric pressure scale to indicate pressure-altitude.

3. *General requirements.*

3.1 *Materials and workmanship.*

3.1.1 *Materials.* Materials shall be of a quality which experience and/or tests have demonstrated to be suitable and dependable for use in aircraft instruments.

3.1.2 *Workmanship.* Workmanship shall be consistent with high-grade aircraft instrument manufacturing practice.

3.2 *Identification.* The following information shall be legibly and permanently marked on the units or attached thereto:

a. Name of instrument (altimeter).

b. SAE Specification AS 392A.

c. Manufacturer's part No.

d. Manufacturer's Serial No. or date of manufacture.

e. Manufacturer's name and/or trade mark.

3.3 *Environmental conditions.* The following conditions have been established as design requirements only. Tests shall be conducted as specified in sections 5, 6, 7.

3.3.1 *Temperature.* When installed in accordance with the instrument manufac-

turer's instructions, the instrument shall function over the range of ambient temperature of -30° C. to 50° C. and shall not be adversely affected by exposure to temperatures of -65° C. to 50° C.

3.3.2 *Humidity.* The units shall function and shall not be adversely affected when exposed to any relative humidity in the range from 0 to 95 percent at a temperature of approximately 32° C.

3.3.3 *Vibration.* When installed in accordance with the manufacturer's instructions, the units shall function and shall not be adversely affected when subjected to the following vibration.

Frequency: 500-3,000 cycles per minute.
Amplitude: 0.010 inch.

Maximum acceleration: 0.8 g.

NOTE: It is understood that the unit shall withstand vibration at higher frequencies but the acceleration value need not exceed that shown above.

When specified by the purchaser for use in rotary wing aircraft, the frequency range shall be 150-3,000 cycles per minute.

3.3.4 *Overpressure.* The units shall not be adversely affected by exposure to a pressure of 50 inches of mercury absolute.

3.4 *Magnetic effect.* The magnetic effect of the indicator shall not adversely affect the operation of the instruments installed in the same aircraft.

4. *Detail requirements.*

4.1 *Indicating method.* The following method of indication shall be employed. For indicating an ascent in altitude the sensitive pointer shall move in a clockwise direction completing one revolution (360°) for each 1,000 feet of altitude change. A means shall be provided for showing the multiples of 1,000 feet.

4.2 *Dial markings.*

4.2.1 *Increments.* Markings shall be provided at intervals not exceeding 20 feet of altitude with major increment markings at 100-foot intervals.

4.2.2 *Zero setting system.* A zero setting system shall be provided which will permit the altimeter to be set to show field elevation at any existing ground level barometric pressure. The zero setting system shall show the barometric pressure in inches of mercury or millibars at sea level throughout the range of at least 28.1 to 30.99 inches (946 to 1,049 millibars). A safety feature shall be provided which will prevent incorrect reading of the pressure scale when the zero setting mechanism exceeds its barometric pressure limits.

4.2.3 *Finish.* Unless otherwise specified, luminescent material (self-activating) shall be applied to the pointer(s), major graduations and numerals.

4.2.4 *Name.* The word "altitude" shall be marked on the dial and may be in the same finish as the numerals.

4.3 *Visibility.* Pointers and dial markings shall be visible from any point within the frustum of a cone, the side of which makes an angle of 30° with the perpendicular to the dial and the small diameter of which is the aperture of the instrument case. The distance between the dial and the cover glass shall be a practical minimum and shall not exceed 0.25 of an inch.

5. *Test conditions.*

5.1 *Atmospheric conditions.* Unless otherwise specified, all tests required by this specification shall be conducted at an atmospheric pressure of approximately 29.92 inches of mercury and at a temperature of approximately 22° C. When tests are made with the atmospheric pressure or the temperature substantially different from the values, allowance shall be made for the variation from the specified condition.

5.2 *Vibration (to minimize friction).* Unless otherwise specified, all tests for performance may be made with the instrument

¹ Copies may be obtained from the Society of Automotive Engineers, 29 West 39th St., New York, N. Y.

subjected to a vibration of 0.002 to 0.005 inch amplitude at a frequency of 1,500 to 2,000 cycles per minute. The term amplitude, as used herein, indicates the total displacement from positive maximum to negative maximum.

5.3 Vibration equipment. Vibration equipment shall be used which will vibrate at any desired frequency between 500 and 3,000 cycles per minute and shall subject the instrument to vibration such that a point on the instrument case will describe, in a plane inclined 45° to the horizontal, a circle, the diameter of which is equal to the amplitude specified herein.

5.4 Standard pressures. The standard pressures used in calibrating the altimeters shall be as specified in tables III and IIIa.

6. Individual performance requirements. All instruments shall be subjected to whatever tests the manufacturer deems necessary to demonstrate specific compliance with this specification including the following requirements where applicable.

6.1 Calibration. For a period of not less than 12 hours prior to this test the altimeter shall not have been operated at other than the pressures specified in section 5.1. The barometric pressure scale shall be set at 29.92 inches of mercury and the scale error recorded. Without changing the setting, the altimeter shall be subjected successively to the pressures specified in table I. The reduction in pressure shall be made at a rate of approximately 3,000 feet per minute. The altimeter shall remain at the pressure corresponding to each test point for at least 1 minute but not more than 10 minutes before a reading is taken. The error at all test points shall not exceed the tolerances specified in table I. The movement of the pointers shall be free from backlash and irregular motion when the pressure is changed uniformly.

6.2 Case leak. A pressure equivalent to 18,000 feet within the case shall not result in leakage exceeding the tolerance shown in table II during a period of 10 seconds.

6.3 Position error. The change in pointer indication with change in instrument position shall not exceed the tolerance specified in table II.

6.4 Barometric scale error. With the ambient pressure constant at 29.92 inches of mercury, various settings of the barometric pressure scale within its range shall cause the pointer to indicate the equivalent altitude as shown in table III within a tolerance of 25 feet.

7. Qualification tests. As many instruments as deemed necessary to demonstrate that all instruments will comply with the requirements of this section shall be tested in accordance with the manufacturers' recommendations.

7.1 Low temperature. The instrument shall be exposed to a temperature of -30° C.

for 3 hours and while at this temperature shall meet the requirements of section 6.1 within the tolerances specified in table I.

7.2 Extreme temperature exposure. The instrument shall, after alternate exposures to ambient temperatures of -65° C. and 50° C. for periods of 24 hours each and a delay of 3 hours at room temperature following completion of the exposure, meet the requirements of section 6.1. There shall be no evidence of damage as a result of exposure to the extreme temperatures specified herein.

7.3 Hysteresis. Not more than 15 minutes after the altimeter has been first subjected to the pressure corresponding to the upper limit of the scale in section 6.1 the pressure shall be increased at a rate corresponding to a decrease in altitude of approximately 3,000 feet per minute until the pressure corresponding to 25,000 feet is reached. Within 10 seconds the instrument shall indicate within 100 feet of the test reading. The altimeter shall remain at this pressure for at least 5 minutes but not more than 15 minutes before the test reading is taken. After the reading has been taken, the pressure shall be further increased at the above rate until atmospheric pressure is reached. The reading of the altimeter at either of the two test points shall not differ from the reading of the altimeter for the corresponding altitude in the scale error test by more than the tolerance specified in table II.

7.4 After effect. Not more than 5 minutes after the completion of the hysteresis test, the pointers shall have returned to their original reading, corrected for any change in atmospheric pressure within the tolerance specified in table II.

7.5 Vibration. The instrument shall be vibrated at 500 cycles per minute so that a point on the case will describe a circle of 0.003-0.005 inch diameter. The frequency shall be slowly increased to 3,000 cycles per minute and then slowly decreased to 500 cycles per minute, to determine whether the natural frequency of the instrument is in this range. The drift of the pointer shall not exceed 50 feet and it shall not oscillate more than 20 feet. After three hours exposure to the vibration amplitude specified in section 3.3.3 and at the natural frequency (if between 500 and 3,000 cycles per minute) or at 2,000 cycles per minute the instrument shall meet the requirements of section 6. No damage shall be evident after this test.

7.6 Magnetic effects. The magnetic effect of the altimeter shall be determined in terms of the deflection of a free magnet approximately 1½ inches long in a magnetic field

with a horizontal intensity of 0.18 ± 0.01 gauss, when the indicator is held in various positions on an east-west line with its nearest part 5 inches from the center of the magnet. (An aircraft compass with the compensating magnets removed therefrom may be used as the free magnet for this test.) The maximum deflection of the magnet shall not exceed 1° for any pointer deflection.

7.7 Humidity. The instrument shall function and not be adversely affected when exposed to the extreme condition specified in paragraph 3.3.2 for a period of 10 hours.

7.8 Overpressure. After being subjected momentarily to an absolute pressure of 50 inches of mercury the pointers shall return to their original reading, corrected for any change in atmospheric pressure, within 30 feet. Complete recovery shall have been effected in not more than 30 minutes after the pressure application.

TABLE I—ALTIMETER SCALE ERRORS

Standard altitude	Equivalent pressure mercury		Tolerance, feet plus or minus	
	MM	IN	Room temperature sec. 6.1	Low temperature sec. 7.1
0	760.0	29.92	20	75

(2) *Application.* (1) Sensitive altimeters complying with the specifications appearing in this section are hereby approved for all aircraft. Sensitive altimeters already approved by the Administrator may continue to be installed in aircraft.

(a) For which an application for original type certificate is made prior to the effective date of this section.

(b) The prototype of which is flown within one year after the effective date of this section, and

(c) The prototype of which is not flown within one year after the effective date of this section if due to causes beyond the applicant's control.

(i) If an alteration involving a change in type or model of sensitive altimeters is made within nine months after the effective date of this section, previously approved types of sensitive altimeters may be installed. However, in any such change made after the nine-month period, new types of sensitive altimeters installed in aircraft used in instrument

flight shall meet the specifications contained herein.

(c) *Specific instructions.*—(1) *Marking.* In addition to the identification information required in the referenced specification, each sensitive altimeter shall be permanently marked with the Technical Standard Order designation, CAA-TSO, C10a, to identify the altimeter as meeting the requirements of this section in accordance with the manufacturers' statement of conformance outlined below. This identification will be accepted by the Civil Aeronautics Administration as evidence that the established minimum safety requirements for sensitive altimeters have been met.

(2) *Data requirements.* None.

(3) *Effective date.* After March 1, 1949, specifications contained in this section will constitute the basis for Civil Aeronautics Administration approval of sensitive altimeters for use in certificated aircraft used in instrument flight.

(4) *Deviations.* Requests for deviation from, or waiver of, the requirements

of this section; which affect the basic airworthiness of the component, should be submitted for approval by the Chief, Aircraft Service, Office of Aviation Safety, Civil Aeronautics Administration. These requests should be addressed to the nearest Regional Office of the Civil Aeronautics Administration, Attention: Superintendent, Aircraft Branch.

(5) *Conformance.* (1) The manufacturer shall furnish to the Civil Aeronautics Administration, Aircraft Service, Attention: A-298, Washington 25, D. C., a written statement of conformance signed by a responsible official of his company, setting forth that the sensitive altimeter to be produced by him meets the minimum safety requirements established in this section. Immediately thereafter, distribution of the sensitive altimeter conforming with the terms of this section may be started and continued.

(ii) The prescribed identification on the sensitive altimeter does not relieve the aircraft manufacturer or owner of

responsibility for the proper application of the sensitive altimeter in his aircraft, nor waive any of the requirements concerning type certification of the aircraft in accordance with existing Civil Air Regulations.

(iii) If complaints of nonconformance with the requirements of this section are brought to the attention of the Civil Aeronautics Administration, and investigation indicates that such complaints are justified, the Administrator will take appropriate action to restrict the use of the product involved.

(iv) Copies of this Technical Standard Order and other Technical Standard Orders may be obtained from the Civil Aeronautics Administration, Aviation Information Staff, Washington 25, D. C. [Supp. 5, 14 F. R. 3368]

§ 4b.691-9 *Technical Standard Order TSO-C16: "Air-Speed Tubes (Electrically Heated)"* (CAA rules which apply to § 4b.691) (a) *Introduction.* (1) Electrically heated air-speed tubes are in the class of aircraft components which the Administrator of Civil Aeronautics is authorized to approve in accordance with Parts 4a and 4b of this subchapter.

(2) This Technical Standard Order is intended to serve as a criterion by which the product manufacturer can obtain Civil Aeronautics Administration approval of his electrically heated air-speed tube.

(3) In the establishment of this Technical Standard Order, consideration has been given to existing Government and industry standards for air-speed tubes for the purpose of adopting the performance requirements of one of the recognized aeronautical standards as the minimum safety requirements for air-speed tubes which are intended for use in civil aircraft. The specification of the Society of Automotive Engineers for electrically heated air-speed tubes contains such requirements.

(b) *Directive.*

(1) *Provision.* Pursuant to §§ 4a.31, 4a.550, 4b.41, and 4b.691 of this subchapter, which authorize the Administrator to approve aircraft equipment, the performance requirement for air-speed tubes as set forth in sections 5 and 6 of SAE Specification AS-393, Air-Speed Tubes, Electrically Heated, dated December 1, 1947,¹ stated below, are hereby established as minimum safety requirements for electrically heated air-speed tubes which are intended for use in civil aircraft.

1. *Purpose.* To specify minimum requirements for Electrically Heated Air Speed Tubes for use on aircraft the operation of which may subject the instrument to environmental conditions specified in section 3.4.

2. *Scope.* This specification covers the following basic types:

Type I. Pitot Pressure, Straight and L-shaped, 12 and 24 volt nominal, 2 wire circuit.

Type II. Pitot and Static Pressures, Straight and L-shaped 12 and 24 volt nominal, 2 wire circuit.

3. *General requirements.*

3.1 *Materials and workmanship.*

3.1.1 *Materials.* Materials shall be of a quality which experience and/or tests have

demonstrated to be suitable and dependable for the purpose intended.

3.1.2 *Workmanship.* Workmanship shall be consistent with high grade instrument manufacturing practice.

3.2 *Radio interference.* The instrument shall not be the source of objectionable interference under operating conditions at any frequencies used on aircraft, either by radiation or feedback, in radio sets installed in the same aircraft as the instrument.

3.3 *Identification.* The following information shall be legibly and permanently marked on the units or attached thereto:

a. Name of instrument.

b. SAE Spec. AS 393.

c. Rating (Nominal Voltage).

d. Manufacturer's Part No.

e. Manufacturer's Serial No. or date of manufacture.

f. Manufacturer's name and/or trademark.

3.4 *Environmental conditions.* The following conditions have been established as design criteria only. Tests shall be conducted as specified in sections 5, 6, 7.

3.4.1 *Temperature.* When the instruments are mounted in accordance with manufacturer's instructions, they shall function over the range of ambient temperatures of -65°C to $+70^{\circ}\text{C}$ and shall not be adversely affected by exposure to temperatures of -65°C to $+70^{\circ}\text{C}$.

3.4.2 *Vibration.* When the instruments are mounted in accordance with the manufacturer's instructions, they shall function and shall not be adversely affected when subjected to the following vibration:

Frequency: 500-3,000 cycles per minute.

Amplitude: 0.250 inch.

Maximum Acceleration: 32.5 g.

NOTE: It is understood that the unit shall withstand vibration at higher frequencies but the acceleration value need not exceed that shown above.

When specified by the purchaser for use in rotary wing aircraft, the frequency range shall be 150-3,000 cycles per minute.

4. *Detail requirements.*

4.1 *Drainage.* The tube shall be designed to provide maximum drainage of water, resulting from rain or melting ice, consistent with maintaining the calibration specified in sections 6.3, 6.4 and 6.5.

4.2 *Marking.* Pitot pressure and Static pressure lines shall be identified by the letters P and S, respectively, stamped, etched, engraved or otherwise permanently marked on the lines or fittings. The top of the tube shall be identified.

5. *Individual performance tests.* All instruments shall be subjected to whatever tests the manufacturer deems necessary to demonstrate specific compliance with the specification including the following requirements, where applicable.

5.1 *Leakage.* With a pressure of 10 inches of mercury applied separately to the pitot pressure and/or the static pressure lines, there shall be no evidence of leakage when the corresponding pitot or static pressure openings and drain holes are sealed.

5.2 *Dielectric.* The insulation shall withstand without evidence of damage the application of a sinusoidal voltage at a commercial frequency between the terminals of the heater circuit and the shell (case) for a period of 5 seconds. The R. M. S. value of the sinusoidal voltage applied shall be 500 volts.

5.3 *Heater operation.* When mounted in its normal position, the tube shall be tested for heater operation by applying the minimum rated voltage (12 or 24 volts) for a period of 2 minutes. The power consumption at that time shall be within ± 30 percent of the power consumption at rated voltage.

6. *Qualification tests.* As many instruments as deemed necessary to demonstrate that all instruments will comply with the

requirements of this section shall be tested in accordance with the manufacturer's recommendations, where applicable.

6.1 *Vibration.* The tubes shall be subjected to vibration for three hour periods in each of the three perpendicular reference planes such that a point on the tip of the tubes will oscillate $\frac{1}{4}$ inch. The test shall be conducted such that each period of three hours shall consist of one hour at 1,000, 2,000 and 3,000 cycles per minute. Rated voltage shall be applied to the terminals continuously during this test. Ambient temperature shall be 20° to 30°C . There shall be no failure of any kind.

6.2 *Endurance.* The tubes shall be made to operate continuously in still air at 15 or 30 volts (as applicable) for, at least, five hours. Ambient temperature shall be 70°C . There shall be no damage of any kind except discoloration, which will not affect corrosion resistance.

6.3 *Calibration at zero angle of attack.* The tube shall be mounted in a wind tunnel in line with the airflow and tested separately for pitot pressure and for static pressure at the values for air speeds specified in table I. The test shall be made by comparison with the results obtained under similar conditions with a calibrated tube. The error of the tube expressed in terms of indicated air speed shall not exceed 1 percent of the indication or 1 MPH, whichever is greater, and the static pressure shall be within the tolerances specified in table I.

TABLE I—PERMISSIBLE ERRORS IN STATIC PRESSURE

Indicated air speed m. p. h.:	Tolerance inches of water
50.....	0.10
75.....	.15
100.....	.20
125.....	.25
150.....	.30
175.....	.35
200.....	.40
225.....	.45
250.....	.50

6.4 *Calibration at various angles of attack.* The tube shall be tested as specified for "Error at Zero Angle of Attack" at approximately 125 MPH except that the angle of attack shall be varied by 2-degree intervals from $+16$ to -10 degrees inclusive. The indicated error expressed in terms of indicated air speed shall not differ from the indicated error at zero angle of attack by more than 3 miles per hour, and the error in static pressure shall not differ from the static pressure at zero angle of attack by more than 0.20 inch of water.

6.5 *Calibration at various angles of yaw.* The tube shall be tested as specified in section 6.3 at approximately 125 MPH except that the angle of yaw shall be varied between plus and minus five degrees. The indicated error expressed in terms of indicated air speed shall not differ from the error at zero angle of yaw by more than 3 miles per hour and the error in static pressure shall not differ from the static pressure at zero angle of yaw by more than 0.20 inch of water.

6.6 *Magnetic effect.* The magnetic effect of the tube shall be determined in terms of the deflection of a free magnet approximately $1\frac{1}{2}$ inches long in a magnetic field with a horizontal intensity of 0.18 ± 0.01 gauss, when the tube is held in various positions and with rated voltage applied on an east-west line with its nearest part five inches from the center of the magnet. (An aircraft Compass with the compensating magnets removed therefrom may be used as the free magnet for this test.) The Maximum deflection of the magnet shall not exceed 5 degrees for any pointer deflection.

6.7 *De-icing.* The tube shall be tested in an icing wind tunnel at a temperature of -10° to -20°C , and at an indicated tunnel air speed of 200 miles per hour. When the

¹ Copies may be obtained from the Society of Automotive Engineers, 29 West 39th St., New York, N. Y.

tube is coated with $\frac{1}{4}$ inch of ice at the nose, the minimum rated voltage shall be applied to the terminals. The time required to clear the ice cap shall not be more than 2 minutes after the potential is applied. No re-icing shall occur.

6.3 *Cold resistance.* The tube shall be subjected to a temperature of -65°C . or colder for a minimum period of 48 hours. There shall be no evidence of damage. After this test, the tube shall be capable of successfully passing all tests described heretofore.

(2) *Application.* (i) Air-speed tubes complying with the specifications appearing in this Technical Standard Order are hereby approved for all aircraft. Air-speed tubes already approved by the Administrator may continue to be installed in aircraft:

(a) For which an application for original type certificate is made prior to the effective date of this order.

(b) The prototype of which is flown within 1 year after the effective date of this order, and

(c) The prototype of which is not flown within 1 year after the effective date of this order if due to causes beyond the applicant's control.

(ii) If a major change is made in the installation within 9 months after the effective date of this order involving a change in type or model of air-speed tube, previously approved types of air-speed tubes may be installed. However, in any such change made after the 9-month period, new types of air-speed tubes installed in aircraft used in instrument flight shall meet the specifications contained herein.

(c) *Specific instructions.*

(1) *Marking.* In addition to the identification information required in the referenced specification, each air-speed tube shall be permanently marked with the Technical Standard Order designation "CAA-TSO-C16" to identify the air-speed tube as meeting the requirements of this order in accordance with the manufacturer's statement of conformance outlined below. This identification will be accepted by the Civil Aeronautics Administration as evidence that the established minimum safety requirements for air-speed tubes have been met.

(2) *Data requirements.* None.

(3) *Effective date.* After September 1, 1948, specifications contained in this Technical Standard Order will constitute the basis for Civil Aeronautics Administration approval of air-speed tubes for use in certificated aircraft used in instrument flight.

(4) *Deviations.* Requests for deviation from, or waiver of, the requirements of this order, which affect the basic airworthiness of the component, should be submitted for approval by the Director, Aircraft Service, Office of Aviation Safety, Civil Aeronautics Administration. These requests should be addressed to the nearest regional office of the Civil Aeronautics Administration, Attn: Superintendent, Aircraft Branch.

(5) *Conformance.* (i) The manufacturer shall furnish to the CAA, Aircraft Service, A-298, Washington 25, D. C., a written statement of conformance signed by a responsible official of his company, setting forth that the air-speed tube to be produced by him meets the minimum

safety requirements established in this order. Immediately thereafter distribution of the air-speed tube conforming with the terms of this order may be started and continued.

(ii) The prescribed identification on the air-speed tubes does not relieve the aircraft manufacturer or owner of responsibility for the proper application of the air-speed tube in his aircraft, nor waive any of the requirements concerning type certification of the aircraft in accordance with existing Civil Air Regulations.

(iii) If complaints of nonconformance with the requirements of this order are brought to the attention of the Civil Aeronautics Administration, and investigation indicates that such complaints are justified, the Administrator will take appropriate action to restrict the use of the product involved.

(iv) Copies of this Technical Standard Order and other Technical Standard Orders may be obtained from the Civil Aeronautics Administration, Aviation Information Staff, Washington 25, D. C.

§ 4b.691-10 *Portable water-solution type fire extinguishers* (CAA rules which apply to § 4b.691 (c)). See § 4b.448-4.

[Supp. 4, 14 F. R. 3197]

INSTRUMENTS; INSTALLATION

GENERAL

§ 4b.696 *Arrangement and visibility of instrument installations.* (a) Flight, navigation, and power-plant instruments for use by each pilot shall be easily visible to him from his station with the minimum practicable deviation from his normal position and line of vision when he is looking out and forward along the flight path.

(b) All the required flight instruments shall be conveniently grouped and as nearly as practicable centered about the vertical plane of the pilot's forward vision.

(c) All the required power-plant instruments shall be closely grouped on the instrument panel. Identical power-plant instruments for the several engines shall be so located as to prevent any misleading impression as to the engines to which they relate. Important power-plant instruments shall be easily visible to the appropriate personnel.

§ 4b.697 *Instrument panel vibration characteristics.* The vibration characteristics of the instrument panel shall not be such as to seriously impair the accuracy of the instruments or to damage them.

FLIGHT AND NAVIGATION INSTRUMENTS

§ 4b.701 *Air-speed indicating system.* This system shall be so installed that the air-speed indicator shall indicate true air speed at sea level under standard conditions to within an allowable installation error of not more than plus or minus 3% or 5 miles per hour, whichever is greater, throughout the operating range of the airplane from 1.3 V_s (flaps up and down) to V_e . The calibration shall be made while in flight and the method used shall be subject to the approval of the Administrator.

§ 4b.702 *Air-speed indicator marking.* The air-speed indicator shall be marked as specified in § 4b.887.

§ 4b.703 *Static air vent system.* All instruments provided with static air case connections shall be vented to the outside atmosphere through a suitable piping system. Such vent(s) shall be so located on the airplane that its orifices will be least affected by air flow variation, moisture, or other foreign matter. The installation shall be such that the system will be airtight, except for the vent into the atmosphere.

§ 4b.704 *Magnetic direction indicator.* The magnetic direction indicator shall be so installed that its accuracy shall not be excessively affected by the airplane's vibration or magnetic fields of a permanent or transient nature. After the magnetic direction indicator has been compensated, the calibration shall be such that the deviation in level flight does not exceed plus or minus 10° on any heading. A suitable calibration placard shall be provided as specified in § 4b.888.

§ 4b.705 *Automatic pilot system.* If an automatic pilot system is installed, the following shall be applicable:

(a) The actuating (servo) devices shall be of such design that they can, when necessary, be either positively disengaged from operating the control system or be overpowered by the human pilot so as to enable him to maintain satisfactory control of the airplane.

(b) A satisfactory means shall be provided to readily indicate to the pilot the alignment of the actuating device in relation to the control system to which it operates, except when automatic synchronization is provided.

(c) The manually operated control(s) for the system's operation shall be readily accessible to the pilot.

(d) The automatic pilot system shall be of such design and so adjusted that, within the range of adjustment available to the human pilot, it cannot produce loads in the control system and surfaces greater than those for which they were designed.

§ 4b.705-1 *Technical Standard Order TSO-C9a: "Automatic Pilot" (CAA rules which apply to § 4b.705)*—(a) *Introduction.* (1) Automatic pilots are in the class of aircraft components which the Administrator of Civil Aeronautics is authorized to approve in accordance with Parts 3, 4a, and 4b of this subchapter. (2) This Technical Standard Order is intended to serve as a criterion by which the product manufacturer can obtain Civil Aeronautics Administration approval of his automatic pilot.

(3) In the establishment of this Technical Standard Order, consideration has been given to existing Government and industry standards for automatic pilots for the purpose of adopting the performance requirements of one of the recognized aeronautical standards as the minimum safety requirements for automatic pilots which are intended for use in civil aircraft. The specification of the Society of Automotive Engineers for automatic pilots contains such requirements.

(b) *Directive.*

(1) *Provision.* Pursuant to §§ 3.31, 3.667, 4a.31, 4a.301, 4b.41, and 4b.705 of this subchapter, which authorize the Administrator to approve aircraft equipment, the performance requirements for automatic pilots as set forth in SAE Specification AS-402, Automatic Pilot, dated August 1, 1947,¹ stated below, are hereby established as minimum safety requirements for automatic pilots which are intended for use in civil aircraft:

1. *Purpose.* To specify minimum requirements for automatic pilots for use in aircraft, the operation of which may subject the instruments to the environmental conditions specified in section 3.4.

2. *Scope.* This specification covers all gyroscopic and servo control types of automatic pilots intended for use on aircraft to operate automatically the control surfaces of the aircraft to maintain a stabilized flight attitude with respect to the longitudinal, lateral and vertical axes, and to provide for maneuvering the airplane through servo control.

3. *General requirements.*3.1. *Material and workmanship.*

3.1.1. *Materials.* Materials shall be of a quality which experience and/or tests have demonstrated to be suitable and dependable for aircraft instruments.

3.1.2. *Workmanship.* Workmanship shall be consistent with high grade aircraft instrument manufacturing practice.

3.2. *Radio interference.* The instrument shall not be the source of objectionable interference under operating conditions at any frequencies used on aircraft, either by radiation or feedback, in radio sets installed in the same aircraft as the instrument.

3.3. *Identification.* The following information shall be legibly and permanently marked on each of the major components or attached thereto.

(a) Name of the unit and type of automatic pilot.

(b) SAE Spec. AS 402.

(c) Rating (electrical or vacuum power supply and maximum servo output where applicable).

(d) Manufacturer's part number.

(e) Manufacturer's serial number or date of manufacture.

(f) Manufacturer's name and/or trademark.

3.4. *Environmental conditions.* The following conditions have been established as design criteria only. Tests shall be conducted as specified in sections 5, 6, and 7.

3.4.1. *Temperature.* When located in accordance with the instrument manufacturer's instruction, the units shall function over the range of ambient temperatures as listed in column A below and shall not be adversely affected by exposure to the temperature shown in column B below:

Instrument location	A	B
Power plant accessory compartment...	-30° to 130° C.	-65° to 130° C.
Heated areas (temperature controlled).....	-30° to 50° C.	-65° to 70° C.
Unheated areas (temperature uncontrolled).....	-55° to 70° C.	-65° to 70° C.

3.4.2. *Humidity.* All units shall function and not be adversely affected when exposed to a relative humidity up to and including 95 percent at a temperature of approximately 32° C.

3.4.3. *Altitude.* All units shall function and not be adversely affected when exposed

to a pressure and temperature range equivalent to -1,000 feet to 40,000 feet standard altitude, except as limited by application of section 3.4.1.

3.4.4. *Vibration.* When installed in accordance with instrument manufacturer's instructions, all units shall function and shall not be adversely affected when subjected to vibrations having characteristics likely to be encountered at the locations in the aircraft where the units are to be installed.

4. *Detail requirements.*4.1. *Instrumentation.*

4.1.1. *Direction indication.* If aircraft direction indication is provided it shall be in accordance with AS 397 or AS 399.

4.1.2. *Bank and pitch indication.* If aircraft bank and/or pitch indication is provided it shall be in accordance with AS 396.

4.1.3. *Servo signal indication.* Means shall be provided to clearly indicate the magnitude and direction of servo signal present, except where automatic synchronization is provided. Then, yaw and roll signal need not be indicated. With the automatic pilot engaged, the pitch axis indication shall be representative of control surface load.

4.1.4. *Engagement indication.* Means shall be provided to clearly indicate whether the automatic pilot servos are in the engaged or disengaged position.

4.1.5. *System power indication.* Means shall be provided to permit operation of a device to indicate whether or not the instrument is receiving power.

4.1.6. *Servo power indication.* Means shall be provided to indicate when the servos are engaged but are not energized if such condition is possible.

4.1.7. *Caging indication.* Means shall be provided to indicate when the gyros are caged, except where it is not possible to leave them in a caged condition.

4.1.8. *Interlock indication.* The operation of any protective interlock device which renders any part of the system inoperative shall be indicated.

4.2. *Control range.*

4.2.1. *Corrective control.* The automatic pilot shall give stabilized control about the three axes throughout the following minimum ranges:

(a) Pitch $\pm 50^\circ$.

(b) Roll $\pm 75^\circ$.

(c) Yaw $\pm 20^\circ$.

4.2.2. *Command control.* Means shall be provided to limit maneuvering the airplane, through the automatic pilot controls, to the following maximum ranges:

(a) Pitch $\pm 30^\circ$.

(b) Bank $\pm 45^\circ$.

(c) Turn=unlimited angle to the right or left.

4.3. *On-off control.* Means shall be provided, either electrical or mechanical, to permit the automatic pilot to be put in operation and to remove it from operation.

4.4. *Safety provisions.*

4.4.1. *Servo force.* Means shall be provided to limit the servo force to a safe value as determined in specific applications. The mounting base and housing of the servos shall be designed to withstand a load of 1.5 times the maximum output of the servo applied in a manner similar to that found in actual installation.

4.4.2. *Interlock provisions.* A means shall be provided to prevent the servo system from becoming operative until the automatic pilot is ready for operation.

4.4.3. *Indicator power source.* When the pitch and bank and/or azimuth units furnish an indicating reference, either directly or by repeaters, the automatic pilot shall be so designed that they become operative simultaneously with the turning on of the aircraft power source.

4.4.4. *Special features.* When special features are incorporated in the design of the automatic pilot (either integral or as accessories) they shall provide adequate inter-

locks, electrical and/or mechanical to prevent improper operation. For example:

(a) Coordinated turn control. Bank shall be limited.

(b) Altitude control. Pitch attitude correction shall be limited.

(c) Glide path control. Pitch attitude correction shall be limited.

4.4.5. *Servo disengaging means.* A positive mechanical means, independent of the aircraft power supply, shall be provided to disengage the servos from the aircraft control system. When the servos are disengaged, the manual control of the aircraft shall not be objectionably affected.

4.4.6. *Emergency release.* Means shall be provided for releasing the automatic control. The actuating device shall be suitable for mounting on the control wheel.

4.4.7. *Reliability.* Insofar as practicable, without affecting its normal operation, the automatic pilot design shall be such that should a failure occur in the system, no signal shall occur which would apply hazardous control to the airplane.

4.5. *Stability.* The roll, pitch and yaw signal sources shall establish the three axes about which the airplane is automatically controlled. The automatic pilot shall provide flight attitude stabilization, in smooth air, within 1 degree of selected attitude and heading about the above reference axes.

4.6. *Power variations.* All units shall properly function with a voltage and frequency variation of $\pm 10\%$ of the rated value (provided the A. C. voltage and frequency vary in the same direction), and/or $\pm 30\%$ of the rated vacuum or hydraulic pressure. Power variations beyond these limits shall not cause adverse control.

5. *Test Conditions.*

5.1. *Atmospheric conditions.* Unless otherwise specified, the tests shall be accomplished at atmospheric pressure of approximately 29.92 inches of mercury and at an ambient temperature of approximately 22° C. When tests are made with atmospheric pressure or temperature substantially different from these values, allowance shall be made for the difference from the specified conditions.

5.2. *Vibration (to minimize friction).* Unless otherwise specified, all tests for performance may be made with the instrument subjected to a vibration of 0.002 to 0.005 inch amplitude at a frequency of 1,500 to 2,000 cycles per minute. The term amplitude as used herein indicates the total displacement from positive maximum to negative maximum.

5.3. *Power conditions.* Unless otherwise specified all tests for performance shall be conducted at the power rating recommended by the manufacturer.

5.4. *Vibration stand.* A vibration stand shall be used which will vibrate at any desired frequency between 500 and 3,000 cycles per minute and shall subject the instrument to vibration such that a point on the instrument case will describe in a plane inclined 45 degrees to the horizontal plane, a circle, the diameter of which is equal to the amplitude specified herein.

6. *Individual performance tests.* All of the various units or complete system shall be tested in accordance with the manufacturer's recommendations. The manufacturer shall conduct sufficient tests to prove compliance with this specification, including the following requirements where applicable.

6.1. *Dielectric.* Insulation shall be subjected to a dielectric test with a R. M. S. voltage at a commercial frequency applied for a period of five seconds equivalent to five times normal circuit operating voltage except where circuits include condensers or other components for which such a test would be inappropriate; then the test voltage shall be 1.25 times circuit operating voltage. The insulation resistance shall not be less than 20 megohms at that voltage.

7. *Qualification tests.* As many instruments or components as deemed necessary to

¹ Copies may be obtained from the Society of Automotive Engineers, 29 West 39th St., New York, N. Y.

demonstrate that all instruments will comply with the requirements of this section shall be tested in accordance with the manufacturer's recommendations.

7.1. *Low temperature operation.* Each component, or the complete system, after having been subjected to an ambient temperature of -30°C . or -55°C . as applicable (see par. 3.4.1) for a period of 5 hours, without operating, shall then meet the requirements of section 6 at that temperature.

7.2. *High temperature.* The requirements of section 7.1 shall apply except that the exposure temperature shall be 50°C ., 70°C ., or 130°C . as applicable (see par. 3.4.1).

7.3. *Extreme temperature exposure.* The instrument or components shall, after alternate exposures to ambient temperatures of -65°C . and 70°C . or -65°C . and 130°C . as applicable (see par. 3.4.1) for periods of 24 hours each and a delay of 3 hours following completion of the exposure, meet the requirements of section 6 at room temperature. There shall be no evidence of damage as a result of exposure to the extreme temperature specified herein.

7.4. *Magnetic effect.* Magnetic effect of the controller and all indicators shall be determined in terms of the deflection of a free magnet approximately $1\frac{1}{2}$ inches long, in a magnetic field with a horizontal intensity of 0.18 (± 0.01) gauss when the units are held in various positions on an east-west line 12 inches from the center of the magnet. The maximum deflection of the magnet shall not exceed five degrees. Tests shall be made with instruments in power-on condition.

7.5. *Humidity.* The instrument shall be operated under the extreme condition specified in section 3.4.2 for a period of 10 hours after which it shall meet the requirements of section 6.

7.6. *Vibration.* The components shall be subjected to vibration with amplitudes of 0.005" to 0.063" as specified by the manufacturer at frequencies from 1,000 to 3,000 cycles per minute in order to determine that the natural frequency of the components does not lie in this frequency range. After three hours exposure to a vibration test recommended by the manufacturer, as per section 3.4.4, the instrument shall meet the requirements of section 6.

(c) *Application.* (i) Automatic pilots complying with the specifications appearing in this Technical Standard Order are hereby approved for all aircraft. Automatic pilots already approved by the Administrator may continue to be installed in aircraft:

(a) For which an application for original type certificate is made prior to the effective date of this order.

(b) The prototype of which is flown within 1 year after the effective date of this order, and

(c) The prototype of which is not flown within 1 year after the effective date of this order if due to causes beyond the applicant's control.

(ii) If a major change is made in the installation within 9 months after the effective date of this order involving a change in type or model of automatic pilot, previously approved types of automatic pilots may be installed. However, in any such change made after the 9-month period new type of automatic pilots installed in aircraft used in instrument flight shall meet the specifications contained herein.

(c) *Specific instructions.*

(1) *Marking.* In addition to the identification information required in the referenced specification, each automatic pilot shall be permanently marked with

the Technical Standard Order designation "CAA-TSO-C9" to identify the automatic pilot as meeting the requirements of this order in accordance with the manufacturer's statement of conformance outlined below. This identification will be accepted by the Civil Aeronautics Administration as evidence that the established minimum safety requirements for automatic pilots have been met.

(2) *Data requirements.* None.

(3) *Effective date.* After July 1, 1948, specifications contained in this Technical Standard Order will constitute the basis for Civil Aeronautics Administration approval of automatic pilots for use in certificated aircraft used in instrument flight.

(4) *Deviations.* Requests for deviation from, or waiver of, the requirements of this order, which affect the basic airworthiness of the component, should be submitted for approval by the Director, Aircraft and Components Service, Office of Safety Regulation, Civil Aeronautics Administration. These requests should be addressed to the nearest regional office of the Civil Aeronautics Administration, Attn: Superintendent, Aircraft and Components Branch.

(5) *Conformance.* (i) The manufacturer shall furnish to the CAA, Aircraft and Components Service, A-298, Washington 25, D. C., a written statement of conformance signed by a responsible official of his company, setting forth that the automatic pilot to be produced by him meets the minimum safety requirements established in this order. Immediately thereafter distribution of the automatic pilot conforming with the terms of this order may be started and continued.

(ii) The prescribed identification on the automatic pilot does not relieve the aircraft manufacturer or owner of responsibility for the proper application of the automatic pilot in his aircraft, nor waive any of the requirements concerning type certification of the aircraft in accordance with existing Civil Air Regulations.

(iii) If complaints of nonconformance with the requirements of this order are brought to the attention of the Civil Aeronautics Administration, and investigation indicates that such complaints are justified, the Administrator will take appropriate action to restrict the use of the product involved.

(iv) Copies of this Technical Standard Order and other Technical Standard Orders may be obtained from the Civil Aeronautics Administration, Aviation Information Staff, Washington 25, D. C.

[13 F. R. 3855, 7734]

§ 4b.706 *Gyroscopic indicators (air-driven type).* All air-driven gyroscopic instruments installed shall derive their energy from a suction air pump driven either by an engine or an auxiliary power unit. The following detail requirements shall be applicable:

(a) Two suction air pumps actuated by separate power means shall be provided, either one of which shall be of sufficient capacity to operate, at the service ceiling of the airplane in normal cruising condition, all of the air-driven

gyroscopic instruments with which the airplane is equipped.

(b) A suitable means shall be provided in the attendant installation, where the pump lines connect into a common line, to select either suction air pump for the proper functioning of the instruments, should failure of one source or a breakage of one pump line occur. When an automatic means to permit simultaneous air flow is provided in the system, a suitable method for indicating any interrupted air flow in the pump lines shall be incorporated in the system. In order to indicate which source of energy has failed, a visual means shall be provided to indicate this condition to the flight crew.

(c) A suction gauge shall be provided and so installed as to indicate readily to the flight crew while in flight, the suction in inches of mercury which is being applied to the air-driven types of gyroscopic instruments. Such gauge(s) shall be connected to the instruments by a suitable system.

POWER-PLANT INSTRUMENTS

§ 4b.711 *Operational markings.* Instruments shall be marked as specified in § 4b.889.

§ 4b.712 *Instrument lines.* Power-plant instrument lines shall comply with the provisions of § 4b.516. In addition, instrument lines carrying inflammable fluids or gases under pressure shall be provided with restricted orifices or equivalent safety devices at the source of the pressure to prevent escape of excessive fluid or gas in case of line failure. (For fire-resistant power-plant instrument lines see §§ 4b.654 and 4b.655.)

§ 4b.713 *Fuel quantity indicator.* Means shall be provided to indicate to the flight personnel the quantity in gallons or equivalent units of usable fuel in each tank during flight. Tanks whose outlets and air spaces are interconnected may be considered as one tank and need not be provided with separate indicators. Exposed sight gauges shall be so installed and guarded as to prevent breakage or damage. Fuel quantity indicators shall be calibrated to read zero during level flight when the quantity of fuel remaining in the tank is equal to the unusable fuel supply as defined by § 4b.494. (See § 4b.891.)

§ 4b.714 *Fuel flowmeter system.* When a fuel flowmeter system is installed in the fuel line(s), the metering component shall be of such design as to include a suitable means for bypassing the fuel supply in the event that malfunctioning of the metering component offers a severe restriction to fuel flow.

§ 4b.715 *Oil quantity indicator.* Ground means, such as a stick gauge, shall be provided to indicate the quantity of oil in each tank. (See § 4b.890.) If an oil transfer system or a reserve oil supply system is installed, means shall be provided to indicate to the flight personnel the quantity of oil in each tank during flight.

§ 4b.716 *Cylinder head temperature indicating system for air-cooled engines.* A cylinder head temperature indicator

shall be provided for each engine on airplanes equipped with cowl flaps. In the case of airplanes which do not have cowl flaps, an indicator shall be provided if compliance with the provisions of §§ 4b.571-4b.595 is demonstrated at a speed in excess of the speed of best rate of climb.

ELECTRICAL SYSTEMS AND EQUIPMENT

§ 4b.721 *Installation.* (a) Electrical systems and equipment shall:

(1) Be free from hazards in themselves, in their method of operation, and in their effects on other parts of the airplane;

(2) Be installed in such a manner that they are suitably protected from fuel, oil, water, other detrimental substances, and mechanical damage.

(b) In addition to the requirements specified, all electrical equipment shall be of a type and design adequate for the use intended. For substantiation of the electrical system the data required under § 4b.16 is considered to include:

(1) Wiring diagrams, including a schematic power supply diagram.

(2) Installation data which includes the manufacturer's name and type of all electrical items and reference to pertinent specifications.

(3) A load analysis.

(c) Items of electrical equipment for specific types of airplane operations are listed in Part 41 entitled "Certification and Operation Rules for Scheduled Operations Outside the Continental Limits of the United States" and Part 61 entitled "Scheduled Air Carrier Rules," of this subchapter.

BATTERIES

§ 4b.726 *Capacity.* The capacity shall be that determined necessary from an electrical load analysis.

§ 4b.727 *Protection against acid.* Means shall be provided to prevent corrosive battery substance from coming in contact with other parts of the airplane during servicing or flight.

§ 4b.728 *Battery containers.* Batteries shall be completely enclosed in a container or compartment and shall be easily accessible for servicing and inspection on the ground.

§ 4b.729 *Battery vents.* The battery container or compartment shall be vented in such a manner that gases released by the battery are carried outside the airplane.

§ 4b.730 *Battery cooling.* Battery cooling shall be provided, if necessary, to keep the battery temperature within the limits specified by the battery manufacturer.

GENERATORS

§ 4b.736 *Capacity.* The capacity necessary shall be determined initially from an electrical load analysis and its adequacy shall be demonstrated during flight test. A switch shall be provided for each generator to permit its output to be interrupted.

§ 4b.737 *Generator rating.* Individual generators shall be capable of delivering their continuous rated power.

§ 4b.738 *Generator controls.* Generator voltage control equipment shall be capable of dependably regulating the generator output within rated limits.

§ 4b.739 *Reverse current cut-out.* A generator reverse current cut-out shall disconnect the generator from the battery and other generators when the generator is developing a voltage of such value that current sufficient to cause malfunctioning can flow into the generator.

MASTER SWITCH

§ 4b.741 *Arrangement.* A master switch arrangement shall be provided which will disconnect all sources of electrical power from the main distribution system at a point adjacent to the power sources.

§ 4b.742 *Installation.* The master switch or its controls shall be so installed that it is easily discernible and accessible to a member of the crew in flight.

PROTECTIVE DEVICES

§ 4b.746 *Fuses or circuit breakers.* Protective devices (fuses or circuit breakers) shall be installed in the circuits to all electrical equipment except that such items need not be installed in the main circuits of starter motors or in other circuits where no hazard is presented by their omission.

§ 4b.747 *Protective devices installation.* Protective devices in circuits used in flight shall be so located and identified that fuses may be replaced or circuit breakers reset readily in flight.

§ 4b.748 *Spare fuses.* If fuses are used, one spare of each rating or 50% spare fuses of each rating, whichever is greater, shall be provided.

ELECTRIC CABLES

§ 4b.751 *Electric cables.* The electrical cable used shall be in accordance with approved standards for aircraft electric cable of a slow burning type and shall have adequate current carrying capacity to deliver the necessary power to the items of equipment to which it is connected.

SWITCHES

§ 4b.756 *Capacity.* Switches shall be capable of carrying their rated current.

§ 4b.757 *Installation.* Switches shall be so installed as to be readily accessible to a member of the crew and shall be suitably labeled as to operation and the circuit controlled.

INSTRUMENT LIGHTS

§ 4b.761 *Intensity.* Instrument lights shall provide sufficient illumination to make all instruments, switches, etc., easily readable and discernible.

§ 4b.762 *Installation.* Instrument lights shall be installed in such a manner that their direct rays are shielded from the pilot's eyes and that no objectional reflections are visible to him.

§ 4b.763 *Light dimming.* A suitable means of controlling the intensity of illumination shall be provided unless it can be shown that nondimmed instrument lights are satisfactory.

LANDING LIGHTS

§ 4b.766 *Type.* Landing lights shall be of a type acceptable to the Administrator.

§ 4b.767 *Landing light installation.* Landing lights shall be so installed that there is no objectionable glare visible to the pilot and also that the pilot is not seriously affected by halation. They shall be installed at such a location that they provide adequate illumination for night landing.

§ 4b.768 *Landing light switch.* A switch for each light shall be provided, except that where multiple lights are installed at one location, a single switch for the multiple lights is satisfactory.

POSITION LIGHTS

§ 4b.771 *Type.* Forward and rear position lights shall be of a type certificated in accordance with Part 15 of this chapter.

§ 4b.772 *Forward position light installation.* Forward position lights shall be so installed that, with the airplane in normal flying position, the red light is displayed on the left side and the green light on the right side, each showing unbroken light between two vertical planes whose dihedral angle is 110 degrees when measured to the left and right, respectively, of the airplane from dead ahead. The lights shall be spaced laterally as far apart as practicable.

§ 4b.773 *Rear position light installation.* The red and white position lights shall be mounted as far aft as practicable and so installed that unbroken light is directed symmetrically aft from each light in such a manner that the axis of the maximum cone of illumination is parallel to the flight path. In addition, the intersection of the two planes forming dihedral angle A given in Part 15 of this subchapter shall be vertical. If separate red and white lights are used, they shall be located as close together as practicable.

§ 4b.774 *Top and bottom fuselage lights.* The top and bottom fuselage lights shall each furnish illumination of an intensity equivalent to that of a 32-candlepower lamp installed in a reflector of relatively high reflective properties and shall have a clear cover glass. They shall show light through approximately a hemisphere.

§ 4b.775 *Top and bottom fuselage lights; installation.* The top fuselage light shall be installed in the top of the fuselage approximately in line with the forward position lights. The bottom fuselage light on landplanes shall be installed in the bottom of the fuselage approximately in line with the forward position lights. In the case of seaplanes the location of the bottom light will be subject to specific approval on each model airplane.

§ 4b.776 *Position light flasher.* The position light flasher shall incorporate two flashing circuits which are energized alternately to provide flashing of the position and fuselage lights in the manner indicated below. The flasher shall

be of a type acceptable to the Administrator.

§ 4b.776-1 *Technical Standard Order TSO-C18: "Position Light Flashers"* (CAA rules which apply to § 4b.776)—

(a) *Introduction.* Under section 601 of the Civil Aeronautics Act of 1938, as amended, and §§ 4a.31, 4a.578, 4b.41, and 4b.776 of this chapter, the Administrator of Civil Aeronautics is authorized to adopt standards for position light flashers intended for use on civil aircraft. In adopting these standards, consideration has been given to existing Government and industry standards for position light flashers.

(b) *Directive—(1) Provision.* (i) The performance requirements for position light flashers, as set forth in sections 3.3, 3.4 (except 3.4.2) 4 (except 4.4 and 4.5) and 5 of SAE Specification AS-211, "Flasher, Position Light" dated November 1, 1948, stated below, are hereby established as minimum safety performance standards for position light flashers intended for use on civil aircraft:

1. *Purpose.* To specify minimum requirements for aircraft position light flashers, the operation of which may subject the flasher to the environmental conditions specified in section 3.3.

2. *Scope.* This specification covers two types of position light flashers:

Type I: For nominal 24 volt d. c. systems.
Type II: For nominal 12 volt d. c. systems.

3. *General requirements.*

3.1 *Materials and workmanship.*

3.1.1 *Materials.* Materials shall be of a quality which experience and/or tests have demonstrated to be suitable and dependable for the purpose intended.

3.1.2 *Choice of materials.* Choice and treatment of materials shall be such as to eliminate or minimize:

1. Corrosion.
2. Fire hazard.
3. Fungus growth.

3.1.3 *Workmanship.* Workmanship shall be consistent with high-grade aircraft electrical equipment practice.

3.2 *Identification.*

3.2.1 *Nameplate.* The following information shall be legibly and permanently marked on the unit or attached thereto:

- a. Name of unit (position light flasher).
- b. SAE specification AS211.
- c. Voltage.
- d. Normal motor current—amps.
- e. Flasher contact capacity—amps.
- f. Manufacturer's part number.
- g. Manufacturer's serial number—(date of manufacture, optional).
- h. Manufacturer's name and/or trademark.

3.2.2 *Wiring diagram.* A diagram of the internal wiring of the flasher shall be legibly marked on the unit or attached thereto.

3.3 *Environmental conditions.* The complete unit shall operate under the following environmental conditions and shall meet the following performance requirements:

3.3.1 *Temperature.* When mounted in accordance with the manufacturer's recommendations, the unit shall function over the range of ambient temperature from -35°C to $+55^{\circ}\text{C}$. It shall not be adversely affected by exposure to temperatures in the range of -65°C to $+70^{\circ}\text{C}$.

3.3.2 *Humidity.* The unit shall function and shall not be adversely affected by exposure to a relative humidity in the range of 5% to 90% throughout a temperature range of -35°C to $+55^{\circ}\text{C}$.

¹ Copies may be obtained from the Society of Automotive Engineers, 29 West 39th St., New York, N. Y.

3.3.3 *Altitude.* The unit shall function and shall not be adversely affected when subjected to a pressure and temperature range equivalent to -1000 feet to $+25,000$ feet standard altitude.

3.3.4 *Vibration.* The unit shall function and shall not be adversely affected when subjected to vibration of 0.060 inch double amplitude at from 600 to 3300 cycles per minute when tested complete with its bracket and/or shock mounts and with the direction of vibration perpendicular to its normal mounting surface.

3.3.5 *Dust.* The instrument shall function and shall not be adversely affected when subjected to severe sand and dust conditions.

3.3.6 *Salt spray.* The instrument shall function and shall not be adversely affected when subjected to a salt spray for a period of 100 hours.

3.4 *Radio interference.*

3.4.1 *Radio interference.* The flasher motor shall not be the source of objectionable interference under operating conditions, at any frequencies used on the aircraft, either by radiation or feed back, in radio sets installed in the same aircraft as the flasher. The flasher case shall be electrically continuous and shall be grounded to the aircraft structure.

3.4.2 *Interference suppression.* The motor circuit shall be provided with the necessary radio interference suppression features to suppress its radio interference to the limits set forth herein for conducted and radiated radio interference. In particular, these features shall include adequate filters and inclosing case construction which will prevent interference leakage through it or through joints, seams, and mating surfaces. The volume and weight of filtering equipment required shall be minimized by the application of proper electrical and mechanical design and construction.

3.4.3 *Conducted radio interference limits.* The conducted radio interference voltage produced by operation of the equipment on wiring connected to or associated with the equipment, when measured between each terminal and the ground plane, shall not exceed 200 microvolts over the frequency range of 0.15 to 0.2 of a megacycle and 50 microvolts over the frequency range of 0.2 to 20 megacycles.

3.4.4 *Radiated radio interference.* The radio interference field produced by operation of the equipment when measured with the rod or dipole antenna of the measuring instrument placed in various positions one foot from the equipment and interconnecting cable assemblies, shall not exceed the microvolt values shown in the following table:

Frequency band Mcs.:	Microvolts
0.15-65.0.....	2.5
65.0-100.0.....	5.0
100.0-150.0.....	10.0

4. *Detail requirements.*

4.1 *Input voltage.* The flasher shall perform under all conditions outlined herein, over these input voltages:

- Type I: 22 to 28.5 volts d. c.
- Type II: 11 to 14.5 volts d. c.

4.2 *Flashing cycle and accuracy.* The flashing cycle shall be repeated 40 ± 4 times per minute. Each cycle shall be as follows:

Wing tip and white tail light "ON"-----	130°
Dark-----	50°
Top and bottom fuselage lights and red tail light "ON"-----	130°
Dark-----	50°

A maximum deviation of 5° from these periods is permissible.

4.3 *Current carrying capacity.* Flashing light circuits shall be capable of operating lamp loads having total values as follows:

- Type I flasher: 3.0 amps.
- Type II flasher: 6.0 amps.

They shall satisfactorily handle the inrush currents of the position lights they are to flash.

4.4 *Motor power consumption.* Normal Power Consumption of the motor circuit shall be no more than 10 watts.

4.5 *Life.* The flasher shall operate 500 hours with no adjustment or replacement of parts and shall operate 1,000 hours with no repair other than the replacement of the contacts in the light circuits.

5. *Individual performance requirements.*

5.1 *Individual performance test.* Each flasher unit, before shipment shall be operated at room ambient conditions to assure that it meets the requirements of 4.2 above over the whole range of input voltages specified in 4.1. It shall also be subjected to an insulation resistance test before any internal circuits to ground are completed to assure its freedom from shorts, grounds, etc. Resistance shall not be less than 10 megohms.

(ii) For the purposes of this order, the terms "motor" and "the flasher motor" contained in sections 3.2.1 and 3.4.1 of AS-211, shall be interpreted to mean any type of actuating mechanism.

(2) *Application.* (i) Position light flashers complying with the specifications appearing in this order are hereby approved for all aircraft. Position light flashers already approved by the Administrator may continue to be installed in aircraft:

(a) For which an application for original type certificate is made prior to the effective date of this order.

(b) The prototype of which is flown within one year after the effective date of this order, and

(c) The prototype of which is not flown within one year after the effective date of this order if due to causes beyond the applicant's control.

(ii) If an alteration involving a change in type or model of position light flasher is made within nine months after the effective date of this order, previously approved types of position light flashers may be installed. However, in any such change made after the nine-month period, new types of position light flashers installed on aircraft used in scheduled air carrier operation shall meet the specifications contained herein.

(c) *Specific instructions—(1) Marking.* In addition to the identification information required in the referenced specification, each position light flasher shall be permanently marked with the Technical Standard Order designation, CAA-TSO-C18 to identify the position light flasher as meeting the requirements of this order in accordance with the manufacturers' statement of conformance outlined below. This identification will be accepted by the Civil Aeronautics Administration as evidence that the established minimum safety requirements for position light flasher have been met.

(2) *Data requirements.* Ten copies of installation, operating, and maintenance recommendations or instructions shall be submitted by the manufacturer of the position light flasher with his statement of conformance to the Civil Aeronautics Administration, Aircraft Service, Attn: A-298, Washington 25, D. C.

(3) *Effective date.* After May 1, 1949, specifications contained in this order will constitute the basis for Civil Aeronautics Administration approval of position light flashers for use on certificated aircraft used in scheduled air carrier operation.

(4) *Deviations.* Requests for deviation from, or waiver of, the requirements

of this order, which affect the basic airworthiness of the component, should be submitted for approval by the Director, Aircraft Service, Office of Aviation Safety, Civil Aeronautics Administration. These requests should be addressed to the nearest Regional Office of the Civil Aeronautics Administration, Attn: Superintendent, Aircraft Branch.

(5) *Conformance.* (1) The manufacturer shall furnish to the CAA, Aircraft Service, A-298, Washington 25, D. C., a written statement of conformance signed by a responsible official of his company, setting forth that the position light flasher to be produced by him meets the minimum safety requirements established in this order. Immediately thereafter distribution of the position light flasher conforming with the terms of this order may be started and continued.

(ii) The prescribed identification of the position light flasher does not relieve the aircraft manufacturer or owner of responsibility for the proper application of the position light flasher on his aircraft, nor waive any of the requirements concerning type certification of the aircraft in accordance with existing Civil Air Regulations.

(iii) If complaints of nonconformance with the requirements of this order are brought to the attention of the Civil Aeronautics Administration, and investigation indicates that such complaints are justified, the Administrator will take appropriate action to restrict the use of the product involved.

(iv) Copies of this Technical Standard Order and other Technical Standard Orders may be obtained from the Civil Aeronautics Administration, Aviation Information Staff, Washington 25, D. C.

[Supp. 4, 14 F. R. 3197]

§ 4b.777 *Flashing light sequence.* The forward position lights and the rear white position light shall be on one of the flasher circuits, and the top and bottom fuselage lights and the rear red position light shall be on the other. The flashing sequence shall be repeated automatically when the position light switch is in the "flash" position.

§ 4b.778 *Flashing light cut-out switch.* A switch shall be provided to eliminate the flasher from the position light circuit so that continuous light may be provided by the forward position lights and the rear white position light. The top and bottom fuselage lights shall not be lighted under this condition.

RIDING LIGHT

§ 4b.781 *Standards.* When a riding light is required, seaplanes, flying boats, and amphibians shall have at least one riding (anchor) light, which is capable of showing a white light for at least two miles at night under clear atmospheric conditions.

§ 4b.782 *Installation.* The riding light shall be so installed that it shows the maximum unbroken light practicable when the airplane is moored or drifting on the water. Externally hung light(s) are permitted.

SAFETY EQUIPMENT; INSTALLATION

§ 4b.791 *Marking.* Safety equipment controls which the crew is expected to operate at the time of an emergency such as flares, automatic life raft releases, etc., shall be readily accessible and plainly marked as to the method of operation. When fire extinguishing, life enduring, and signaling equipment is carried in lockers, compartments, etc., such storage places shall be marked for the benefit of passengers and crew.

DE-ICERS

§ 4b.796 *Installation.* When pneumatic de-icers are installed, the installation shall be in accordance with approved data. Positive means shall be provided for the deflation of the pneumatic boots.

FIRE EXTINGUISHERS

§ 4b.799 *Number and installation.* (a) The approved hand-type fire extinguisher required in § 4b.691 (c) shall be installed primarily for the use of the pilot and copilot. The installation of the additional fire extinguishing equipment required in Parts 41 and 61 of this subchapter will depend upon the size and type of the aircraft and the disposition and size of the crew and passengers and location of such fire extinguishers used will be subject to the approval of the Administrator.

(b) An approved fire extinguisher is one approved by the Underwriters' Laboratories or by any other agency deemed qualified by the Administrator.

FLARES

§ 4b.801 *Flare requirements.* When parachute flares are required, they shall be of a type certificated in accordance with Part 15 of this subchapter.

§ 4b.802 *Flare installation.* Parachute flares shall be releasable from the pilot compartment and so installed that danger from accidental discharge is reduced to a minimum. It shall be demonstrated in flight that the installation in each model of airplane is such that ejection is accomplished without any hazard to the airplane or its occupants. If the flares are ejected so that recoil loads are involved, structural provision for such loads shall be made.

SAFETY BELTS AND SIGNAL

§ 4b.806 *Type.* Safety belts shall be of a type certificated in accordance with Part 15 of this subchapter. They shall be so attached that no part of the attachment will fail at a lower load than that specified in § 4b.443 (b).

§ 4b.807 *Safety belt signal.* When a means is provided to indicate to the passengers when the seat belt should be fastened, the device shall be so installed that it can be operated from the seat of either pilot or copilot.

EMERGENCY FLOTATION AND SIGNALING EQUIPMENT

§ 4b.811 *General.* When required by Parts 40, 41, and 61 of this subchapter, an approved life raft or approved life preserver is one approved by either the Administrator, the Bureau of Marine In-

spection and Navigation, the U. S. Army Air Forces, or the Bureau of Aeronautics, Navy Department.

§ 4b.811-1 *Technical Standard Order TSO-C12: "Life Rafts" (CAA rules which apply to § 4b.811)*—(a) *Introduction.* (1) Life rafts are in the class of aircraft components which the Administrator of Civil Aeronautics is authorized to approve in accordance with Parts 3, 4a, and 4b of this subchapter.

(2) This Technical Standard Order is intended to serve as a criterion by which the product manufacturer can obtain Civil Aeronautics Administration approval of his life raft.

(3) In the establishment of this Technical Standard Order, consideration has been given to existing Government and industry standards for life rafts for the purpose of adopting the performance requirements of one of the recognized aeronautical standards as the minimum safety requirements for life rafts which are intended for use in civil aircraft. The specification of the National Aircraft Standards Committee for life rafts contains such requirements.

(b) *Directive.*

Provision. Pursuant to §§ 3.31, 3.716, 4a.31, 4a.525, 4a.537, 4b.41, and 4b.811 of this subchapter, which authorize the Administrator to approve aircraft equipment, including life rafts, the performance requirements for life rafts as set forth in National Aircraft Standards Specification NAS 800, *Airline Life Rafts*, dated November 19, 1947,¹ stated below, are hereby established as minimum safety requirements for life rafts which are intended for use in civil aircraft:

1. *Applicable specifications.*

1.1 The following specifications shall by references hereinafter noted form a part of this specification.

1.1.1 *U. S. Army Specifications.* U. S. Army Spec. 94-40420A Raft, Pneumatic Type A-3A.

2. *Type and grade.*

2.1 This specification covers minimum performance and safety requirements for all types of airline life rafts suitable for commercial transoceanic use.

3. *Materials and workmanship.*

3.1 *Fabric material.* Rubberized fabric used in the construction of the air tubes shall have the following physical characteristics:

Tensile strength (Grab Test) Warp 190 lbs. per inch (Min.). Filler 190 lbs. per inch (Min.).

Tear (Trapezoidal Method): 12 x 12 lbs. per inch (Min.).

Permeability: 10 liters/24 hrs. (Max.).

The ply or coat adhesion of the fabric shall not be less than 3.5 lbs. per square inch. Fabrics used in bottoms, canopy, spray shield, etc., shall be suitable for the purpose intended.

3.2 *Protection.* All metal parts shall be corrosion resistant or suitably protected against corrosion. All cotton material, ropes and twine shall be mildew proofed.

4. *Detail requirement.*

4.1 *Design and construction.*

4.1.1 *Shape.* The raft shall be circular in shape.

4.1.2 *Size.* The following dimensions shall determine the size of raft:

10 man—Inside diameter of raft: 6 ft. 6 in.

¹ Copies may be obtained from the American Aeronautical Forum, 506 Washington Loan and Trust Building, Washington 4, D. C.

15 man—Inside diameter of raft: 8 ft.
20 man—Inside diameter of raft: 10 ft.

4.1.3 *Number of tubes.* The raft shall have two identical air tubes, one superimposed on the other.

4.1.4 *Floor.* The raft shall have a center type floor (suspended from between tubes), with manually inflated blister on each side in the center.

4.1.5 *Buoyancy.* The minimum buoyancy per person shall be 250 pounds, based on the two tubes only (disregarding the buoyancy derived from the floor or the inflatable floor support). Minimum free-board shall be 12 inches for all rafts herein considered, utilizing buoyancy of the complete raft allowing 165 pounds per person. Not less than 85% of each tube should be CO₂ inflated (boarding station tubes are manually inflated with air).

4.1.6 *Inflation.* Both tubes inflated by CO₂ equipment to a pressure of not less than 1 psi and not more than 1½ psi at a corrected temperature of 70° F. and at corrected standard atmospheric pressure. Inflation equipment shall be located on outside periphery of raft. The CO₂ release mechanism shall be suitably identified and protected by a conspicuous warning flap or tab which must be unfastened to permit actuation of the release device. Arrangement shall be such that failure of one tube or manifold will not allow loss of gas in second tube. Any manifold system shall permit equal distribution of gas to the individual tubes. No sealing material which will harden or obstruct the gas passage shall be used.

4.1.7 *Bulkheads.* None required except at boarding stations.

4.1.8 *Boarding stations.* One boarding station shall be provided in each tube and shall consist of a section of tube (minimum length of 30") to be manually inflated from either side of raft. Locations of boarding stations shall not impair rigidity of raft.

4.1.9 *Boarding handles.* Boarding handles shall be suitably located at each boarding station to best assist persons entering the raft from the water. They shall be designed to withstand a pull of 250 lbs. per handle.

4.1.10 *Life line.* A life line of webbing, ¼ inch cotton rope (or equivalent), shall encircle the raft on the outside periphery. It shall be usable with the raft floating either side up. It shall be attached to the raft at intervals by means of knots at the webbing loops (or equivalent).

4.1.11 *Manual inflation valves.* Shall be located so as to permit pump inflation of both tubes from either side. Must not interfere with occupant comfort.

4.1.12 *Color.* All exposed surfaces shall be yellow, conforming to Shade No. 120 of Supplement to Specification #3-1 (U. S. Army Spec. Ref. Sect. E-2 of Spec. #94-40420A) or superior high visibility color.

4.2 Accessory equipment.

4.2.1 *Raft lanyard.* A suitable lanyard of not less than 5/16" diameter cotton rope (or equivalent) with a minimum length of 20 feet shall be provided. One end shall be attached to the raft at tube intersection with the rest of the line held coiled (or looped) at that point. Provision shall be made for attaching the loose end of the lanyard to the outside of the carrying case or container so that the lanyard may be secured to the plane when the raft is put overboard.

4.2.2 *Sea anchor.* A 16" diameter sea anchor shall be provided suitably attached to 25 feet of 5/16" cotton braided line (or equivalent). A point of attachment of suitable strength (not less than 250 lbs.) for the attachment of a sea anchor shall be provided on the tube intersection line diametrically opposite the point of attachment of the raft lanyard.

4.2.3 *Heaving line.* One heaving line (British type or equivalent) shall be located on the outside periphery of the raft so as to be accessible from either side. It shall be mounted near one of the boarding stations. The heaving line and ring shall be designed so as to float on the surface of the water.

4.2.4 *Canopy.* An overall cover shall be provided leaving provisions for opening for two-way cross-ventilation. It shall be easily detachable from periphery of raft. It shall be attached to the periphery of the raft in such a manner as to be usable from either side. Provisions shall be made for supporting the canopy above the heads of the occupants. Material should be light weight, waterproof, non-odorous, and of same color as raft. A closable outlet shall be provided at the center of the canopy to permit controlled trapping of rain water by raft occupants if desired.

4.2.5 *Paddles.* Two paddles, each in two sections, and each 4 feet long (when assembled) shall be provided. The paddles shall be in accordance with or equal to the latest revision of applicable Army or Navy Specifications for Oars; Sectional (Aircraft Use) insofar as materials, strength, general design and finish are concerned. The paddles shall be attached to the raft with suitable rope to prevent loss and stowed to permit easy access and compact raft packing.

4.2.6 *Inflation pump.* The pump shall be in accordance with or equal to the latest revision of the applicable Army-Navy specification for Pumps; Hand Air, insofar as materials, strength, general design and finish are concerned. One pump shall be provided, tied with suitable rope to raft to prevent loss. Stowage shall permit easy access and compact raft packing.

4.2.7 *Accessory case tie-downs.* Provisions shall be made on each side of the floor at center of raft for tie-downs to hold the accessory case. Each tie-down shall be capable of withstanding a pull of 250 pounds.

4.3 Marking instructions.

4.3.1 *Raft identification.* Each raft shall be legibly and permanently marked with the following information:

- Manufacturer's Name.
- Manufacturer's Model and Serial Number.
- National Aircraft Standard Number (NAS 800).

4.3.2 *Placarding instructions.* Suitable placarding in waterproof black ink (or equivalent) shall denote use and location of raft equipment. Placarding shall take into account possible occupancy of either side of raft as well as persons boarding raft from water.

4.4 Tests.

4.4.1 *Pressure test.* Rafts shall withstand an inflation pressure of 6 psi for not more than 10 minutes when new. This test is a check on workmanship, design and seam construction and shall be applied at the manufacturers' plant to occasional rafts selected at random or as otherwise directed by the purchaser.

4.4.2 *Leakage test.* All rafts shall be inflated through the manifold to 2 psi and left for 24 hours. The pressure shall not drop below 1 psi at the end of 24 hours with suitable correction for temperature changes. This test is to be made at the manufacturer's plant.

5. Notes.

5.1 The requirements of this specification are based upon Air Transport Association (ATA) Life Raft Recommendation 1-B.

(c) *Application.* (i) Life rafts complying with the specifications appearing in this Technical Standard Order are hereby approved for all aircraft. Life rafts already approved by the Administrator may continue to be installed in aircraft;

(a) For which an application for original type certificate is made prior to the effective date of this order.

(b) The prototype of which is flown within 1 year after the effective date of this order, and

(c) The prototype of which is not flown within 1 year after the effective date of this order if due to causes beyond the applicant's control.

(ii) If a major change is made in the installation within 9 months after the effective date of this order involving a change in type or model of life raft, previously approved types of life rafts may be installed. However, in any such change made after the 9-month period, new types of life rafts installed in aircraft engaged in over-water operations shall meet the specifications contained herein.

(c) Specific instructions.

(1) *Marking.* In addition to the identification information required in the referenced specification, each life raft shall be permanently marked with the Technical Standard Order designation, "CAA-TSO-C12," to identify the life raft as meeting the requirements of this order in accordance with the manufacturer's statement of conformance outlined below. This identification will be accepted by the Civil Aeronautics Administration as evidence that the established minimum safety requirements for life rafts have been met.

(2) *Data requirements.* None.

(3) *Effective date.* After August 1, 1948, specifications contained in this order will constitute the basis for Civil Aeronautics Administration approval of life rafts for use in certificated aircraft engaged in over-water operations.

(4) *Deviations.* Requests for deviation from, or waiver of, the requirements of this order, which affect the basic airworthiness of the component, should be submitted for approval by the Director, Aircraft Service, Office of Aviation Safety, Civil Aeronautics Administration. These requests should be addressed to the nearest regional office of the Civil Aeronautics Administration, Attn: Superintendent, Aircraft Branch.

(5) *Conformance.* (i) The manufacturer shall furnish to the Civil Aeronautics Administration, Aircraft Service, Attn: A-298, Washington 25, D. C., a written statement of conformance signed by a responsible official of his company, setting forth that the life rafts to be produced by him meet the minimum safety requirements established in this order. The statement of conformance should specify which size life rafts are being produced. Immediately thereafter distribution of the life raft conforming with the terms of this order may be started and continued.

(ii) The prescribed identification on the life raft does not relieve the aircraft manufacturer or owner of responsibility for the proper application of the life raft in his aircraft, nor waive any of the requirements concerning type certification of the aircraft in accordance with existing Civil Air Regulations.

(iii) If complaints of nonconformance with the requirements of this order are brought to the attention of the Civil Aeronautics Administration, and investi-

gation indicates that such complaints are justified, the Administrator will take appropriate action to restrict the use of the product involved.

(iv) Copies of this Technical Standard Order and other Technical Standard Orders may be obtained from the Civil Aeronautics Administration, Aviation Information Staff, Washington 25, D. C. [13 F. R. 7734]

§ 4b.811-2 *Technical Standard Order TSO-C13: "Life Preservers"* (CAA rules which apply to § 4b.811)—(a) *Introduction.* (1) Life preservers are in the class of aircraft components which the Administrator of Civil Aeronautics is authorized to approve in accordance with Parts 3, 4a, and 4b of this subchapter.

(2) This Technical Standard Order is intended to service as a criterion by which the product manufacturer can obtain Civil Aeronautics Administration approval of his life preserver.

(3) In the establishment of this Technical Standard Order, consideration has been given to existing Government and industry standards for life preservers for the purpose of adopting the performance requirements of one of the recognized aeronautical standards as the minimum safety requirements for life preservers which are intended for use in civil aircraft. The specification of the National Aircraft Standards Committee for life preservers contains such requirements.

(b) *Directive.*

Provision. Pursuant to §§ 3.31, 3.716, 4a.31, 4a.525, 4a.537, 4b.41, and 4b.811, of the Civil Air Regulations, which authorize the Administrator to approve aircraft equipment, including life preservers, the performance requirements for life preservers as set forth in National Aircraft Standards Specification NAS 801, *Airline Life Vests*, dated November 19, 1947,¹ stated below, are hereby established as minimum safety requirements for life preservers which are intended for use in civil aircraft:

1. *Applicable specifications.*

1.1 *None.*

2. *Type and grade.*

2.1 This specification covers minimum performance and safety requirements for all types of airline life vests suitable for commercial transoceanic use.

3. *Materials and workmanship.*

3.1 *Finished fabric.* The finished fabric shall have physical characteristics as follows: Tensile str. (Grab test)—200×180 #/in. (Min.).

Permeability—10 liters/sq. m./24 hrs. (Max.).

3.2 *Life.* Rubberized fabrics used shall be reasonably soft for long life storage in folded condition when stored under dark, cool, and dry conditions with temperature variations not to exceed 120° F. max. and minus 10° F. min. for a maximum of 1000 hours and an average of 80° F. for a total life storage of two years.

3.3 *Protection.* All metal parts shall be corrosion resistant or suitably protected against corrosion. All cotton material, ropes and twine shall be mildew proofed.

4. *Detail requirements.*

4.1 *Design and construction.*

4.1.1 *Compartmentation.* The life vest shall have a minimum of two airtight compartments and shall be designed in such a way that any of these compartments when

properly inflated will support the wearer in the proper flotation attitude.

4.1.2 *Inflation.* At least two compartments shall be separately inflated by a CO₂ cartridge contained in a suitable puncture type device. Each compartment shall have an oral inflation valve, unless the vest is designed in such a manner that oral inflation in one compartment completely supplements the buoyancy of the other compartments in which event only the oral inflation compartment need have an oral inflation valve. The oral inflation valve must be so placed as to be in an easily accessible position.

4.1.3 *Buoyancy.* The design of the life vest should be such that the buoyancy with CO₂ inflation be a minimum of 20 pounds and the additional buoyancy developed by topping up with air should provide a total buoyancy of the vest of 25 pounds.

4.1.4 *Flotation attitude.* Vest shall support wearer in a reasonably upright position, face up (not more than a 45° angle from vertical). It shall be impossible to stay in a face down position. The vest shall be self-righting.

4.1.5 *Donning vest.* Vest shall be easily donned and comfortably worn. It shall be capable of being donned by the wearer alone. Inflated vest shall be proof against slipping off the wearer but it shall not have straps which pass between the wearer's legs. It shall not chafe the wearer's neck unduly, nor shall it choke him uncomfortably when inflated.

4.1.6 *Fastening or attachment.* The means of attachment of the vest by straps or fasteners shall be conveniently located and easily operated by the wearer. Consideration shall be given to operation of fastening means under conditions of darkness and low temperature.

4.1.7 *Color.* Color shall be high visibility yellow.

4.2 *Marking and instructions.*

4.2.1 *Vest identification.* Each vest shall be legibly and permanently marked with the following information:

- a) Manufacturer's Name.
- b) Manufacturer's Model and Serial No.
- c) National Aircraft Standard No. (NAS 801).

4.2.2 *Placarding instructions.* The vest shall be suitably marked with the words "TOP—FRONT" placed in the proper location to identify the correct wearing position. Instructions shall also be placed on each vest to identify inflation devices and their means of operation.

4.3 *Tests.*

4.3.1 *Pressure test.* Each compartment must withstand without failure a pressure of 10 lbs./sq. in. for 5 minutes when new.

4.3.2 *Leakage test.* No loss of rigidity shall be noted after each compartment of the vest has been inflated to 2 p. s. i. and hung on a rack for 12 hours. Each compartment shall be tested for leakage.

(c) *Application.* (i) Life preservers complying with the specifications appearing in this Technical Standard Order are hereby approved for all aircraft. Life preservers already approved by the Administrator may continue to be installed in aircraft:

(a) For which an application for original type certificate is made prior to the effective date of this order.

(b) The prototype of which is flown within 1 year after the effective date of this order, and

(c) The prototype of which is not flown within 1 year after the effective date of this order if due to causes beyond the applicant's control.

(ii) If a major change is made in the installation within 9 months after the effective date of this order involving a change in type or model of life preserver,

previously approved types of life preservers may be installed. However, in any such change made after the 9-month period, new types of life preservers installed in aircraft engaged in overwater operations shall meet the specifications contained herein.

(d) *Specific instructions.*

(1) *Marking.* In addition to the identification information required in the referenced specification, each life preserver shall be permanently marked with the Technical Standard Order designation "CAA-TSO-C13" to identify the life preserver as meeting the requirements of this order in accordance with the manufacturer's statement of conformance outlined below. This identification will be accepted by the Civil Aeronautics Administration as evidence that the established minimum safety requirements for life preservers have been met.

(2) *Data requirements.* None.

(3) *Effective date.* After August 1, 1948, specifications contained in this order will constitute the basis for Civil Aeronautics Administration approval of life preservers for use in certificated aircraft engaged in overwater operations.

(4) *Deviations.* Requests for deviation from, or waiver of, the requirements of this order, which affect the basic airworthiness of the component, should be submitted for approval by the Director, Aircraft Service, Office of Aviation Safety, Civil Aeronautics Administration. These requests should be addressed to the nearest regional office of the Civil Aeronautics Administration, Attn: Superintendent, Aircraft Branch.

(5) *Conformance.* (i) The manufacturer shall furnish to the Civil Aeronautics Administration, Aircraft Service, Attn: A-298, Washington 25, D. C., a written statement of conformance signed by a responsible official of his company, setting forth that the life preserver to be produced by him meets the minimum safety requirements established in this order. Immediately thereafter distribution of the life preserver conforming with the terms of this order may be started and continued.

(ii) The prescribed identification on the life preserver does not relieve the aircraft manufacturer or owner of responsibility for the proper application of the life preserver in his aircraft, nor waive any of the requirements concerning type certification of the aircraft in accordance with existing Civil Air Regulations.

(iii) If the complaints of nonconformance with the requirements of this order are brought to the attention of the Civil Aeronautics Administration, and investigation indicates that such complaints are justified, the Administrator will take appropriate action to restrict the use of the product involved.

(iv) Copies of this Technical Standard Order and other Technical Standard Orders may be obtained from the Civil Aeronautics Administration, Aviation Information Staff, Washington 25, D. C. [13 F. R. 7736]

§ 4b.812 *Installation of rafts and life preservers.* When such emergency equipment is required, it shall be so installed as to be readily available to the crew and passengers. Rafts released automatically or by the pilot shall be at-

¹ Copies may be obtained from the American Aeronautical Forum, 506 Washington Loan and Trust Building, Washington 4, D. C.

tached to the airplane by means of a line to keep them adjacent to the airplane.

§ 4b.813 *Signaling device.* Signaling devices, when required by Parts 40, 41, and 61 of this subchapter, shall be accessible, shall function satisfactorily, and be free from any hazard in their operation.

§ 4b.814 *First-aid equipment.* The amount of first-aid equipment will vary with the number and distribution of passengers and the type of operation involved and the location(s) of such equipment shall be subject to the approval of the Administrator.

RADIO EQUIPMENT; INSTALLATION

§ 4b.816 *General.* Radio equipment installations in the airplane shall be free from hazards in themselves, in their method of operation, and in their effects on other components of the airplane.

MISCELLANEOUS EQUIPMENT; INSTALLATION

ACCESSORIES

§ 4b.821 *Accessories.* Engine-driven accessories essential to the safe operation of the airplane shall be distributed among two or more engines.

HYDRAULIC SYSTEMS

§ 4b.826 *General.* Hydraulic systems and elements shall be so designed as to withstand, without exceeding the yield point, any structural loads which may be imposed in addition to the hydraulic loads.

§ 4b.827 *Tests.* Hydraulic systems shall be substantiated by proof pressure tests. When proof tested, no part of the hydraulic systems shall fail, malfunction, or experience a permanent set. The proof load of any system shall be 1.5 times the maximum operating pressure of that system.

§ 4b.828 *Lines.* Hydraulic lines and fittings in all designated fire zones (see § 4b.651) shall comply with the provisions of § 4b.654.

[Amdt. 04-1, 11 F. R. 11351]

§ 4b.829 *Reservoirs and accumulators.* Location of hydraulic reservoirs and accumulators shall comply with the provisions of § 4b.652, except when they are an integral part of the engine or propeller.

[Amdt 04-1, 11 F. R. 11351]

OXYGEN SYSTEM

§ 4b.831 *Oxygen system.* When oxygen is provided to comply with the requirements of Parts 41 and 61 of this subchapter, the oxygen system installation shall be free from hazards in itself, in its method of operation, and in its effects on other components of the airplane. The oxygen equipment shall be of a type and design which experience or conclusive tests have shown to be adequate for the use intended. The minimum amount of supplemental oxygen required per person for continuous operation is indicated in Figure 4b-19.

SUBPART G—OPERATING LIMITATIONS INFORMATION

§ 4b.841 *Information.* Means shall be provided by which the pilot and other appropriate crew members are adequately informed of all operating limitations

upon which the type design is based. Any other information concerning the airplane found by the Administrator to be necessary for safety during its operation shall also be made available to the crew.

LIMITATIONS

§ 4b.846 *Limitations.* The operating limitations specified in §§ 4b.849-4b.876 and any similar limitations shall be established for any airplane and made available to the operator as further described in §§ 4b.881-4b.926, unless its design is such that they are unnecessary.

AIR SPEED

§ 4b.849 *Air speed.* The air-speed limitations set forth in §§ 4b.850-4b.854 shall be established.

§ 4b.850 *Never-exceed speed.* (a) This speed shall not exceed the lesser of the following:

(1) 0.9 V_a chosen in accordance with § 4b.189, or

(2) 0.9 times the maximum speed demonstrated in accordance with § 4b.171, but shall not be less than 0.9 times the minimum value of V_a permitted by § 4b.189.

(b) The 0.9 factor may be suitably modified to take into account the increase of drag coefficient at high Mach numbers. The factor used shall be substantiated by flight tests.

§ 4b.851 *Maximum structural cruising speed.* (a) This operating limitation shall be:

(1) Not greater than V_c chosen in accordance with § 4b.189.

(2) Not greater than 0.89 times the never-exceed speed established under § 4b.850.

(3) Not less than the minimum V_c permitted in § 4b.189.

(b) The 0.89 factor may be suitably modified to take into account the increase in drag coefficient at high Mach numbers. The factor used shall be substantiated by flight tests.

§ 4b.852 *Maneuvering speed.* See § 4b.189.

§ 4b.853 *Flaps extended speed.* This speed shall not exceed the lesser of the following:

(a) The design flap speed, V_f , chosen in accordance with § 4b.189 or

Altitude—thousands of feet.
(Actual altitude for non-pressurized cabin).
(Equivalent altitude for pressurized cabin).

FIGURE 4b-19.—MINIMUM FLOW OF SUPPLEMENTAL OXYGEN FOR CONTINUOUS OPERATION AT VARIOUS ALTITUDES.

(b) The flap design speed chosen in accordance with § 4b.221, but shall not be less than the minimum value of flap design speed permitted in §§ 4b.189 and 4b.221.

§ 4b.854 *Minimum control speed.* See § 4b.129.

POWER PLANT

§ 4b.861 *General.* The power plant limitations set forth in §§ 4b.862 to 4b.864 shall be established and shall not exceed the corresponding limits established as a part of the type certification of the engine and propeller installed in the airplane.

§ 4b.862 *Take-off operation.* (a) Maximum rotational speed (revolutions per minute).

(b) Maximum permissible manifold pressure.

(c) The time limit upon the use of the corresponding power.

(d) Where the time limit of paragraph (c) of this section exceeds 2 minutes, the maximum allowable cylinder head, or coolant outlet and oil temperatures.

§ 4b.863 *Maximum continuous operation.* (a) Maximum rotational speed (revolutions per minute).

(b) Maximum permissible manifold pressure.

(c) Maximum allowable cylinder head, or coolant outlet and oil temperatures.

§ 4b.864 *Fuel octane rating.* The minimum octane rating of fuel required for satisfactory operation of the power plant at the limits of §§ 4b.862 and 4b.863.

AIRPLANE WEIGHT

§ 4b.866 *Airplane weight.* The airplane weight and center of gravity limitations are those required to be determined by §§ 4b.81-4b.86.

FLIGHT CREW

§ 4b.871 *Minimum flight crew.* The minimum flight crew shall be established by the Administrator as that number of persons which he finds necessary for safety in the operations authorized under § 4b.876. This finding shall be based upon the work load imposed upon individual crew members with due consideration given to the accessibility and the ease of operation of all necessary controls by the appropriate crew members.

[Amtd. 046-9, 13 F. R. 2158]

TYPES OF OPERATION

§ 4b.876 *Types of operation.* The types of operation to which the airplane is limited shall be established by the category in which it has been found eligible for certification and by the equipment installed. (See Parts 41 and 61 of this chapter.)

MARKINGS AND PLACARDS

§ 4b.881 *Markings and placards.* The markings and placards specified are required for all airplanes. Placards shall be displayed in a conspicuous place and both shall be such that they may not be easily erased, disfigured, or obscured. Additional information, placards, and

instrument markings having a direct and important bearing on safe operation may be required when unusual design, operating or handling characteristics so warrant.

INSTRUMENT MARKINGS

§ 4b.886 *General.* The instruments listed in §§ 4b.887-4b.891 shall have the following limitations marked thereon. When these markings are placed on the cover glass of the instrument, adequate provisions shall be made to maintain the correct alignment of the glass cover with the face dial. All arcs and lines shall be of sufficient width and so located as to be clearly and easily visible to the pilot.

§ 4b.887 *Air-speed indicator.* (a) True indicated air speed shall be used:

(1) The never-exceed speed, V_{ne} —a radial red line (see § 4b.850).

(2) The caution range—a yellow arc extending from the red line in subparagraph (1) of this paragraph to the upper limit of the green arc specified in subparagraph (3) of this paragraph.

(3) The normal operating range—a green arc with the lower limit at V_s , as determined in § 4b.93 with maximum take-off weight, landing gear and wing flaps retracted, and the upper limit at the maximum structural cruising speed established in § 4b.851.

(4) The flap operating range—a white arc with the lower limit at V_{fo} as determined in § 4b.93 at the maximum landing weight, and the upper limit at the flaps extended speed in § 4b.853.

(b) When the never-exceed speed and maximum structural cruising speed vary with altitude, means shall be provided which will indicate the appropriate limitation to the pilot throughout the operating altitude range.

§ 4b.888 *Magnetic direction indicator.* A placard shall be installed on or in close proximity to the magnetic direction indicator which contains the calibration of the instrument in a level flight attitude with engine(s) operating and radio receiver(s) on or off (which shall be stated). The calibration readings shall be those to known magnetic headings in not less than 45° increments.

§ 4b.889 *Power-plant instruments.* All required power-plant instruments shall be marked with a red radial line at the maximum, and minimum (if applicable) indications for safe operation. The normal operating ranges shall be marked with a green arc which shall not extend beyond the maximum and minimum limits for continuous operation. Take-off and precautionary ranges shall be marked with a yellow arc.

§ 4b.890 *Oil quantity indicators.* Indicators shall be suitably marked in sufficient increments so that they will readily and accurately indicate the quantity of oil.

§ 4b.891 *Fuel quantity indicator.* When the unusable fuel supply for any tank exceeds 1 gallon or 5% of the tank capacity, whichever is greater, a red band shall be placed on the indicator which extends from the calibrated zero reading to the lowest reading obtainable in the level flight attitude, and a suitable notation in the airplane operating

manual shall be provided to indicate to the flight personnel that the fuel remaining in the tank when the quantity indicator reaches zero cannot be used safely in flight. (See § 4b.713.)

CONTROL MARKINGS

§ 4b.896 *General.* All cockpit controls, with the exception of the primary flight controls, shall be plainly marked and/or identified as to their function and method of operation.

§ 4b.897 *Aerodynamic controls.* The secondary controls shall be suitably marked to comply with §§ 4b.353 and 4b.354.

§ 4b.898 *Power-plant fuel controls.* (a) Controls for fuel tank selector valves shall be marked to indicate the position corresponding to each tank and any cross-feed positions that may exist.

(b) When more than one fuel tank is provided, and if safe operation depends upon the use of tanks in a specific sequence, the fuel tank selector controls shall be marked adjacent to or on the control to indicate to the flight personnel the order in which the tanks should be used.

(c) Controls for engine selector valves shall be marked to indicate the position corresponding to each engine.

§ 4b.899 *Accessory and auxiliary controls.* (a) When a retractable landing gear is used, the visual indicator required in § 4b.384 shall be marked in such a manner that the pilot, at all times, can ascertain when the wheels are secured in either extreme position.

(b) Emergency controls shall be colored red and clearly marked as to their method of operation.

MISCELLANEOUS MARKINGS AND PLACARDS

§ 4b.901 *Baggage compartments and ballast location.* Each baggage or cargo compartment and ballast location shall bear a placard which states the maximum allowable weight of contents and, if applicable, any special limitation of contents due to loading requirements, etc.

§ 4b.902 *Fuel, oil, and coolant filler openings.* The following information shall be marked on or adjacent to the filler cover in each case:

(a) The word "fuel", the minimum permissible fuel octane number for the engines installed, and the usable fuel tank capacity. (See § 4b.494.)

(b) The word "oil" and the oil tank capacity.

(c) The name of the proper coolant fluid and the capacity of the coolant system.

§ 4b.903 *Emergency exit placards.* Emergency exits shall be clearly marked as such in letters not less than 3/4 inch high with luminous paint, such markings to be located either on or immediately adjacent to the pertinent exit and readily visible to passengers. Location and method of operation of the handles shall be marked with luminous paint. (See § 4b.434.)

§ 4b.904 *Operating limitation placard.* A placard shall be provided in front of and in clear view of the pilot(s)

stating: "This airplane must be operated in compliance with the operating limitations specified in CAA approved airplane operating manual."

AIRPLANE OPERATING MANUAL

§ 4b.911 *Airplane operating manual.* An airplane operating manual shall be furnished with each airplane. (See Parts 41 and 61 of this subchapter.) The portions of the manual listed in §§ 4b.912-4b.926 shall be verified and approved by the Administrator. Additional items of information having a direct and important bearing on safe operation may be required when unusual design, operating or handling characteristics so warrant. The manual shall contain, as a minimum, the provisions of §§ 4b.916-4b.926.

§ 4b.911-1 *Airplane Flight Manual (CAA policies which apply to § 4b.911).*

(a) *Purpose.* The purpose of this statement of policy is to outline an acceptable arrangement for the Airplane Flight Manual as required by § 4b.911 effective November 9, 1945. Although this material is intended to apply to Part 4b of this subchapter, it may also be used as a guide for the manual required by 4a.760-T. This policy does not affect the status of manuals which already have final or tentative approval. However, whenever such manuals are revised for other reasons, it is recommended that the terminology of this policy be incorporated wherever it will increase clarity and uniformity. It should be noted that not all the items outlined below for inclusion in the document will be necessary for a given airplane, and the Civil Aeronautics Administration is desirous of holding the document to the smallest practicable amount of material. Only the material (listed below) required by 4b should be included in the Civil Aeronautics Administration approved portion of the manual. However, if desired, the manufacturer or operator may add other data in a distinctly separate section in the same cover. The portion of the material (outlined below) that is to be approved by the Civil Aeronautics Administration must be so marked, and clearly separated from any other material so that no one could easily err in regard to the part that is approved.

(b) *Form.* The page size for the Airplane Flight Manual will be left to the decision of the manufacturer. A cover should be provided and it should indicate the nature of the contents with the following title: "Airplane Flight Manual." Each page of the approved portion should bear the notation "CAA Approved" and the date of issuance. The material should be bound in a semi-permanent fashion so that the pages will not be lost easily, yet should be so bound that revised pages can be inserted. The aircraft specification will identify the manual, and when different types of the

airplane (skiplanes, seaplanes, etc.) are covered in separate manuals, each will be listed. Also, the latest approved revisions will be shown on the specification when these changes are considered of major importance to airworthiness.

(c) *Content.* The Airplane Flight Manual should contain as much of the following as is applicable to the individual model. It is suggested that the document be divided into sections as indicated. The sequence of sections and of items within sections should follow the outline below insofar as practicable. This will facilitate revising the document when an airplane is altered in the field.

(a) *Introduction.*—(1) *Title page.* This page should include the manufacturer's name, airplane model, registration or serial number, date of approval and space for the signature of the Director, Aircraft Service. In addition the following note should be included: "This airplane must be operated in compliance with the Operating Limitations contained herein."

(2) *Table of contents.*

(3) *Log of revisions.* Should provide spaces in which to record revised pages and the date inserted.

(b) *Operating limitations.*—(1) *Weight limits.* In addition to the maximum weights and any relative information, a statement to the effect that the airplane must be loaded in accordance with the approved loading schedule should be included. (See paragraph (e), Weight and Balance Data.) The following is a typical example:

(i) Maximum take-off weight at sea level is 92,000 pounds.

(ii) Maximum landing weight at sea level is 73,000 pounds.

NOTE: This airplane is to be operated in accordance with the approved loading schedule (paragraph (e)).

For maximum permissible weights at various altitudes, see paragraph (d), Performance Information. In scheduled passenger operations, operating weights are limited in accordance with Parts 41 or 61 of this subchapter.

(iii) All weight in excess of the maximum permissible landing weight must consist of disposable fuel.

(iv) All weight in excess of 68,000 pounds must consist of fuel for structural reasons.

(v) All fuel weight must be distributed equally on both sides of the airplane. All main tanks must be filled (equally) first, alternates second, and then auxiliaries. Fuel must be used in reverse order from fuel loading except for take-off, climb and landing, at which time the main tanks should be used.

(2) *Center of gravity limits.* All center of gravity limits should be given in inches from the datum, which should be identified, and in percent of the mean aerodynamic chord, with the landing gear extended.

(3) *Power plant.* The following should be listed:

(i) Engine:

(a) Manufacturer.

(b) Model.

(c) Propeller drive gear ratio.

(d) Fuel, minimum octane.

(e) Temperatures—maximum permissible cylinder head and oil inlet.

(f) Power limits—those given by the engine specification; i. e., excluding the effect of ram on critical altitude.

(g) Any limitations, such as r. p. m. ranges in which operation is prohibited due to engine or propeller vibration.

(ii) An explanation of the instrument markings should be included. A typical example follows:

(a) General: Red radial line—maximum and minimum limits. Yellow arc—take-off and precautionary ranges. Green arc—normal operating ranges. Red arc—ranges in which operation is prohibited.

(b) Fuel quantity indicator (when applicable—reference § 4b.891 of this subchapter). Red arc—fuel which cannot be used safely in flight.

(iii) Propellers:

(a) Manufacturer.

(b) Model designation.

(4) *Speed limitations.* (i) Current Regulations (§ 4b.887 of this subchapter) require that air-speed indicator markings be in terms of "true indicated" (calibrated) air speed. However, the "indicated" air speed may also be included parenthetically in addition to the "calibrated" air speed if desired. This offers the advantage that the pilot may read the correct limitation directly from the instrument.

(ii) The following speeds and explanations of their significance should be included:

(a) Never-exceed speed, V_{ne} (previously known as "glide or dive speed") with and without de-icer boots, if applicable, plus a statement to the effect that speeds in excess of this value may result in structural, flutter, or control hazards. The effects of altitude (i. e. Mach number) on this speed should be given if applicable unless the airplane is equipped with a Machmeter, in which case the "never-exceed" Mach number should also be quoted.

(b) Normal operating limit speed, V_{no} (previously known as "level flight or climb speed" or "maximum structural cruising speed"), with and without de-icer boots if applicable, plus statements to the effect that:

(1) Speeds in excess of this value may result in excessive gust loads, whereas speeds below this value will reduce the structural loads produced by severe gusts. The "maneuvering speed" is generally considered the optimum speed to avoid excessive loads as well as inadvertent stalling or loss of control in turbulent air.

(2) This speed should not be deliberately exceeded, even during descents, because of the possibility of unexpected gusts.

(3) The speed range between V_{no} and V_{ne} is to provide for inadvertent speed increases.

(4) When this speed is reduced at altitude because of Mach number effects, the purpose of such reduction is to maintain the margin between V_{no} and V_{ne} for inadvertent speed increases.

(c) Maneuvering speed, V_p , plus a statement of its significance, of which the following is an example: "Maximum use" of the primary flight controls should be confined to speeds below this value. For this purpose, "maximum use" is defined as the lesser of the following:

Rudder—full throw, or ---- pounds force.
Elevator—full throw, or ---- pounds force.
Aileron—full throw or ---- pounds force with each hand.

(d) Flaps extended speed, V_{fe} at least the speed determined in accordance with § 4b.853 of this subchapter must be given. However when desired, speeds for various combinations of flap settings and power conditions may be given. The following is an example:

Flap setting	Max. speed (m. p. h.)	Max. power
Take-off	-----	Take-off.
Approach	-----	Continuous.
	-----	Take-off.
Landing	-----	Throttled.
	-----	Take-off.

(A note should be added to indicate which of the values is to be marked on the air-speed indicator.)

(e) Landing gear operating speed, V_{lo} , plus a statement that this is the maximum speed at which the landing gear may be lowered or raised.

¹ The term "Airplane Flight Manual" has been agreed upon internationally to distinguish the airplane manual from the "operations manuals" issued by air lines and covering the general field of operating practices. Recommendations have been made to the CAB to revise the title of § 4b.911 and the air-speed limitation terminology in accordance with this policy.

(f) Landing gear extended speed, V_{le} , plus a statement that this is the maximum speed with landing gear extended and locked.

(iii) When a speed limitation (e. g., never exceed speed) results from compressibility effects, the manual should include a statement to this effect and information concerning warning symptoms, probable behavior of the airplane and suggested recovery procedure.

(iv) An explanation of the air-speed indicator markings should be included. A typical example follows:

Air-speed indicator markings

(See definitions of speeds above)

Red radial line—never-exceed speed, V_{ne} .
Yellow arc—caution range, extending from V_{no} to V_{ne} .

White arc—flaps extended range, extending from stalling speed (V_{so}) with flaps in landing position at maximum landing weight to the flaps-extended speed (§ 4b.853 of this subchapter).

Green arc—normal operating range: i. e., from stalling speed with flaps retracted at maximum take-off weight to V_{no} .

(5) *Critical cross wind.* Plus a statement that this is the maximum cross component of wind velocity at which it has been demonstrated to be safe to take-off or land. If the value established during the tests is considered the maximum up to which it is considered safe to operate the airplane on the ground, including take-offs and landings, it should be entered under this item; i. e., as a limitation. However, if the value established is not considered limiting it should be included as Performance Information (paragraph (d)). Instead of a limitation. In the case of flying boat an additional maximum cross component of wind velocity for taxiing may be appropriate material.

(6) *Flight load acceleration limits.*

Flaps up— (At take-off weight).
Flaps down— (At landing weight).

(7) *Type of airplane operation.* A typical example would be as follows:

(i) Transport category,
(ii) Instrument night flying (when required equipment is installed).

(iii) Atmospheric icing conditions—should stipulate "none, trace, light, moderate or heavy".

(iv) Propeller reversing to be used for taxiing only.

(8) *Minimum crew.* Should be given for day contact flight and any additional conditions if desired or considered pertinent.

(9) *Miscellaneous.* Should include any information not given above that is restrictive and considered necessary for the safe operation of the airplane. Some typical examples are as follows:

(i) The wing and tail anti-icing heaters should not be operated in flight when the outside air is above 50° F.

(ii) Pressurized cabin differential pressure limits, etc.

If any of the above limitations are repeated necessarily in some other section of the manual; e. g., Operating Procedures (paragraph (c)), it is considered desirable that the limitation be referenced to the pertinent portion of the manual where it is repeated.

(c) *Operating procedures—(1) Normal.* This section should contain information and instructions regarding peculiarities of: Starting and warming engines, taxiing, operation of wing flaps, landing gear, etc. Also included in this section should be instructions for the operation of any equipment that is considered new in the aeronautical field or comparatively complicated.

(i) A typical example of the former would be: Wing flaps should be exercised through three complete cycles prior to all initial take-offs. This operation accomplishes the auto-

matic bleeding and the equalization of pressure to the eight separate hydraulic flap actuating cylinders.

(ii) Typical examples of the latter are:

(a) Recommended operating procedures for thermal ice prevention system.

(b) Recommended operating procedures for reversible pitch propellers.

(c) Cabin pressurization.

(2) *Emergency procedures.* The following should be included:

(i) The procedure to be used in the event of an engine failure, including recommended minimum speeds, trim, operation of remaining engine(s), etc. A typical example would be as follows:

Engine failure on take-off. The minimum speed (V_1) at which the airplane can be controlled directionally on the runway with an outboard engine inoperative and its propeller windmilling, and with take-off power on the remaining engines, is 60 miles per hour TIAS.

The minimum speed at which the airplane is controllable in flight with the sudden failure of an outboard engine, with take-off power on the remaining engines, is 96 miles per hour TIAS.

If an engine fails during the ground roll below speed V_1 , cut the throttles on all engines and apply brakes. If ground contact has already been broken, land straight ahead if sufficient runway remains. If not, retract landing gear, maintain full power on live engines, and continue take-off. Feather the dead engine as outlined in item (ii) below. Use minimum cowl flap setting on live engines to maintain cylinder temperature within limits. Retrim airplane as necessary. Speed for best climb under these conditions is 115 miles per hour TIAS.

See paragraph (d) (pages 9 and 12) for criterion and V_1 speeds used in determining the runway lengths.

(ii) Propeller feathering. This section of the manual should outline the procedure to be followed in stopping the rotation of propellers in flight.

A typical procedure is outlined below:

(a) Throttle—"Closed."

(b) Push feathering switch button. When propeller blades are fully feathered the button will kick out automatically.

(c) Mixture control—"Idle cut-off."

(d) Cowl flaps—"Closed."

(e) Fuel booster pump—"Off."

(f) Tank selector for engine being feathered—"Off." (Do not shut tank selector "Off" if cross feed is being used.)

(g) Ignition for dead engine—"Off."

(h) Propeller pitch control—"Full decrease revolutions per minute."

(iii) Any emergency procedures that are considered unusual or in which a specific sequence of events are required to accomplish the operation satisfactorily. Some typical examples are as follows:

(a) All-engine go-around when it is recommending practice to retract the flap prior to retracting the gear resulting from a design condition in which the flap creates more drag than the gear.

(b) Fire control procedures.

(c) Emergency cabin depressurization.

(d) Emergency landing gear extension.

(e) Emergency brake operation.

(f) Fuel dumping.

(g) Electrical—including operation of circuit breakers. The manual should specify the circuits in which overriding breakers, if any, are used and contain instructions concerning operation of both overriding and nonoverriding types. The following is a typical example:

All circuit breakers are of the nonoverriding type except the fuel booster pumps and propeller feathering circuits. In an emergency, the breakers in these two circuits may be held closed with the possible risk of fire hazard due to short circuits, etc. Discretion should also be used in repeatedly resetting

nonoverriding breakers due to the fact that resetting may reestablish an arc and increase the fire hazard.

(3) *Other special operating procedures (if any).*

(d) *Performance information—(1) Introductory information.* This should include any general information or any pertinent descriptions of the conditions under which the performance data were determined. The following examples are considered typical and appropriate:

(i) All climb data are for standard atmospheric conditions.

(ii) The minimum effective take-off runway lengths given in this section are defined as the longer of the "accelerate-stop distance" and the distance required to take-off and clear a 50-foot obstacle with one engine becoming inoperative at speed V_1 .

(a) The accelerate-stop distance is the distance required to accelerate the airplane from a standing start to the speed, V_1 , and assuming an engine to fail at this point, to stop.

(b) The take-off distance is defined as the sum of the following:

(1) Distance to accelerate to speed V_1 with all engines operating.

(2) Distance to accelerate from speed V_1 to speed V_2 with one engine in operative and propeller windmilling in low pitch. It is assumed that gear retraction is initiated at the end of this segment.

(3) The horizontal distance traveled in climbing to a height of 50 feet at speed V_2 with one engine inoperative. It is assumed that propeller feathering is not commenced prior to the end of this segment.

(i) Speed V_1 is defined as the critical engine failure speed and is a speed at which the controllability has been demonstrated to be adequate to permit proceeding safely with the take-off when the critical engine is suddenly made inoperative. The minimum V_1 speed for this airplane is 60 miles per hour TIAS; however, as explained below, speeds in excess of this value were used in determining the runway lengths.

(ii) Speed V_2 is defined as the minimum take-off climb speed and is the greater of the following: 1.15 times the power-off stalling speed with the flaps in the take-off position (assuming a four-engine airplane); 1.10 times the minimum control speed, V_{mc} .

The minimum control speed, V_{mc} , is defined as the minimum speed at which the airplane is controllable in flight with the sudden failure of an outboard engine with take-off power on the remaining engines.

(c) All runway lengths given in this manual are based upon optimum V_1 speeds; i. e., the speed selected for V_1 is such that the accelerate and stop distance is equal to the distance to clear a 50-foot obstacle with one engine becoming inoperative at this speed. Consequently, V_1 varies with weight, altitude, wind, gradient, etc. Values for V_1 for the various conditions are given on page 11.

(d) All take-off and landing distances given are for dry, concrete runways.

(e) If the maximum cross component of wind velocity in which landings and take-offs were demonstrated was not considered limiting, it should be included in this section of the manual. A typical example would be as follows:

The maximum crosswind component in which this airplane has been tested is 20 miles per hour measured at a height of 50 feet above the ground. Consequently, in determining the effective take-off and landing runway lengths, a crosswind component greater than this value may not be used.

(2) *Performance data.* These data may be given in either graphical or tabular form and should cover the weight range and all airport and terrain altitudes at which the airplane is intended to be operated. The scale of the charts should permit accurate reading within approximately 0.25 of 1 percent.

Following is a list of data that should be included:

- (i) Air speed calibration—normal and alternate static source.
- (ii) Altimeter calibration—normal and alternate static source.
- (iii) True indicated stalling speeds at all appropriate flap positions.
- (vi) Summary of permissible operating, landing and take-off gross weights as limited by the climb of structural requirements.
- (v) Minimum take-off runway length. Unless optimum values of V_1 are selected, establishing equal distances to accelerate to speed V_1 and stop or to make a take-off over a 50-foot obstacle with the critical engine becoming inoperative at speed V_1 , inclusion of both the accelerate and stop distance and runway length required to take-off and clear a 50-foot obstacle will be necessary. It is recommended that these data be given a range of temperatures and runway gradients sufficient to permit proper dispatching under the rules of § 61.213 of this subchapter in addition to the required standard day temperature data.
- (vi) Take-off flight paths through the final climb segment, flight path slope or data slope or data supplementary to the above subdivision (v) that may be used for dispatching purposes should be included. These should be for the same range of temperatures and runway gradients as subdivision (v).
- ¹ (vii) Minimum take-off climb speed, V_{20} , for the range of weights, altitudes and conditions covered in subdivisions (v) and (vi).
- ² (viii) Critical-engine-failure speed, V_1 or speeds V_1 , for the range of weights, altitudes and conditions covered in subdivision (v) and (vi) (if applicable).
- (ix) Minimum runway length required for landing. With respect to this item, the following data would be considered appropriate:
 - (a) Landing distance from height of 50 feet.
 - (b) Minimum effective landing runway length—scheduled stops.
 - (c) Minimum effective landing runway length—alternate stops.
- (x) If it is desired to take advantage of wind in determining landing and take-off distances all data should be based upon wind velocities reported at a height of 50 feet above the runway; i. e., the runway length would be calculated for one-half of the reported head wind velocity, or twice the reported tail wind velocity, measured at a height of 50 feet corrected to the height of the center of aerodynamic drag of the airplane. A note clearly stating the above stipulations should be included in the manual.
- (xi) The rates of climb and climbing speeds for the desired range of weights and altitudes, together with the corresponding airplane configuration (flap position, gear position, etc.), should be given for the following when applicable:
 - (a) First segment take-off climb (§ 4b.103 (a)).
 - (b) Second segment take-off climb (§ 4b.103 (a)).
 - (c) Third segment take-off climb (§ 4b.97 (d)).
 - (d) Final segment take-off climb (§ 4b.97 (e)).
 - (e) One-engine-inoperative en route climb (§ 4b.103 (b)).
 - (f) All-engine en route climb (§ 4b.102 (a)).
 - (g) Two-engines-inoperative en route climb (§ 4b.104).
 - (h) Approach climb (§ 4b.103 (c)).
 - (i) Landing climb (§ 4b.102 (b)).
 - (xii) Engine power curve.

¹ The distance to accelerate to these speeds should also be included to provide data necessary for gradient problems involving runways with variable gradients of sufficient magnitude that average gradients cannot be assumed.

(xiii) Any instructions or examples for use of the performance charts.

(e) *Weight and balance data.* (1) Inasmuch as it is desired to eliminate the necessity of submitting revisions of the Airplane Flight Manual to the CAA for approval whenever an item of equipment is altered or added, this section of the manual will not be included in the formally approved portion of the document. However, a note to the effect that the airplane should be operated in accordance with the approved loading schedule should be included in the Limitations Section. (See paragraph (b) (1)—Weight Limits.)

(2) It is the intention of the Civil Aeronautics Administration to place the responsibility for the control of weight and balance with the manufacturer and operator. The manufacturer will furnish a weight and balance report for each new airplane which may be included in the manual but not in the approved portion. The Civil Aeronautics Administration's representative will not approve each individual report but will make only occasional spot checks to ascertain that the manufacturer's weight control procedure is adequate. The manufacturer will be expected to furnish complete information with the airplane, not only regarding its actual weight and balance, but also to include sketches, samples and other data that will assist the operator in checking the balance after alterations.

(3) The following material is believed to be complete and adequate for a conventional airplane.

- (i) Weight limits. Should list and explain (where necessary) the various weight limits.
- (ii) Center of gravity limits. Approved operating center of gravity range.
- (iii) Empty weight and empty weight center of gravity location.
- (iv) Equipment list. All equipment included in the empty weight.
- (v) Weight computations. The computations necessary to determine the empty weight center of gravity location, including identification of balance datum.
- (vi) Loading schedule.
- (vii) Loading schedule instructions. Complete instructions in the use of the loading schedule.

In the case of unconventional airplane or airplanes with special features, the foregoing should be modified or amplified as necessary to cover the case.

(d) *Submittal.* Three copies of the above material, less the Weight and Balance Data Section, should be submitted to the appropriate Civil Aeronautics Administration regional office by the applicant for an original approval. The three copies will be signed by the Director, Aircraft Service; one copy will be returned to the applicant, one will be retained by the Washington office and the other by the regional office. A single copy of the title page to be used for the Director's signature may be substituted for the manufacturer's copy if desired. Revisions to the manual will be approved in the regional office. In cases where the revisions are of primary importance to safety in flight, the pertinent Aircraft Specification will contain a description of the change to insure that all manuals are revised. A revision of this type would probably be the subject of an Airworthiness Directive note. One copy of the Weight and Balance Data Section should be included in the manual by the manufacturer for each airplane at the time of certification.

[13 F. R. 4182. Correction noted at 14 F. R. 37]

OPERATING LIMITATIONS AND PROCEDURES

§ 4b.916 *Operating limitations.* This part of the manual shall contain the operating limitation information listed below:

(a) *Air-speed limitation.* Sufficient information shall be included in this section of the manual to permit proper marking of the air-speed limitations on the indicator as required in § 4b.887. It shall also include the design maneuvering speed and the maximum safe air speed at which the landing gear can be safely lowered. In addition to the above information, the manual shall explain the significance of the air-speed limitations, and the color coding used. The explanation of the maneuvering speed shall include a statement to the effect that maneuvers involving an approach to a stall, or full application of rudder or aileron controls, should be confined to speeds below this value.

(b) *Power plant limitations.* Sufficient information shall be included in this section of the manual to outline and explain all power-plant limitations (see §§ 4b.861–4b.864) and to permit marking the instruments as required in § 4b.889.

(c) *Weight and loading distribution.* The airplane weights and center of gravity limits required to be determined by §§ 4b.81–4b.86, together with the items of equipment on which the weight empty is based, shall be entered in this section of the manual. Where the variety of possible loadings warrants, instructions adequate to insure observance of those limitations shall be included in this section of the manual. (See also § 4b.82 (b).)

(d) *Flight load acceleration limits.* The positive limit load factors made good by the airplane structure shall be described here in the manual in terms of accelerations.

(e) *Flight crew.* The number and functions of the minimum flight crew required to operate the airplane safely, which has been determined by the requirements of § 4b.871, shall be entered in this section of the manual.

(f) *Type of airplane operation.* This section of the manual shall state the type(s) of operation(s) for which the airplane and its necessary equipment installations have been certificated.

[Amdt. 04-0, 11 F. R. 71, as amended by Amdt. 04b-5, 12 F. R. 3933]

§ 4b.921 *Operating procedures.* This part of the manual shall contain information indicated in paragraphs (a), (b), and (c) of this section which is peculiar to the airplane, and which concerns the normal and emergency procedures necessary to their safe performance by the crew.

(a) *Normal.* This section shall contain information and instructions regarding peculiarities of: Starting and warming engines, taxiing, operation of wing flaps, landing gear, automatic pilot, etc.

(b) *One-engine-inoperative.* This section of the manual shall outline the procedure to be used in the event of engine failure, including recommended minimum speeds, trim, operation of remaining engine(s), etc.

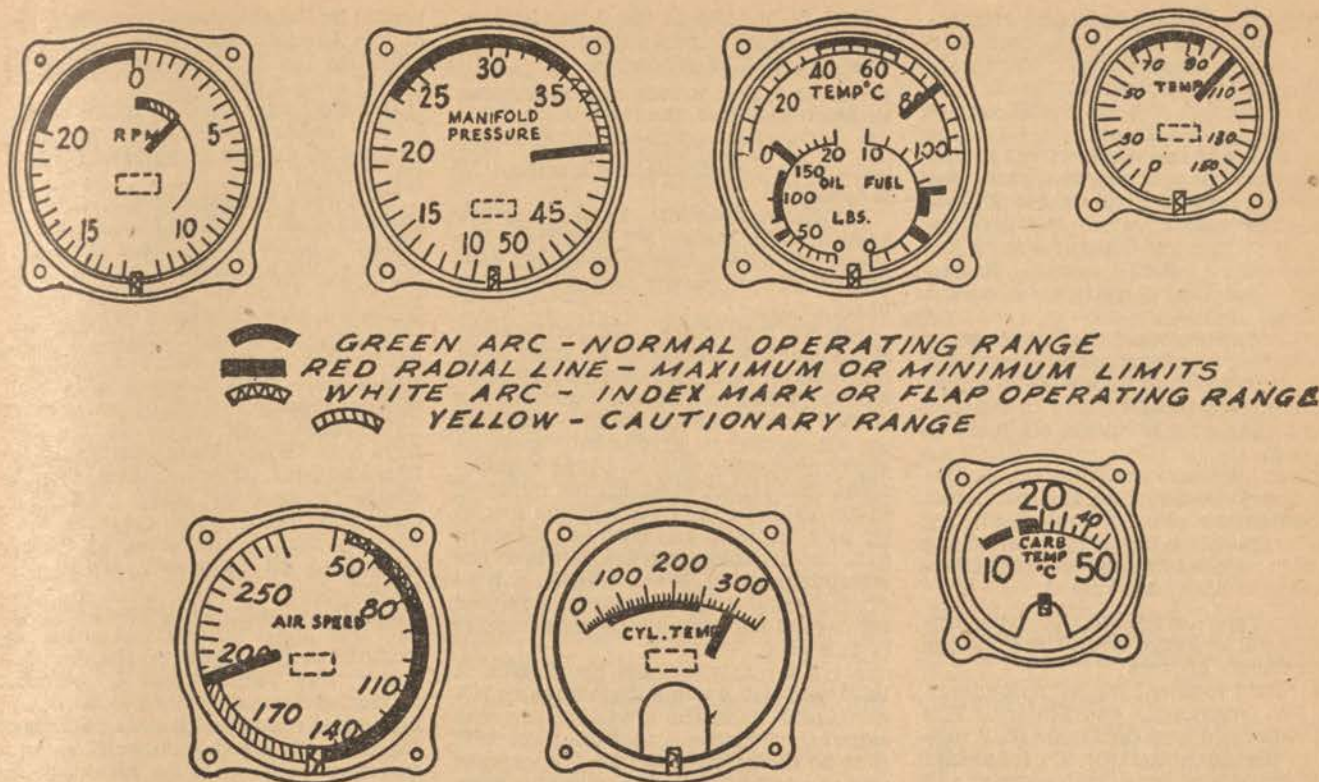

FIGURE 4b-20.—REPRESENTATIVE INSTRUMENT MARKINGS.

(c) *Propeller feathering.* The desirable procedure to be followed in stopping the rotation of propellers in flight shall be included in this section of the manual.

PERFORMANCE

§ 4b.926 *Performance information.* This part of the manual shall contain the performance information listed below:

(a) *Performance data.* A summary of all performance data secured in accordance with §§ 4b.91-4b.114 Performance requirements, as well as all data derived therefrom, required for the application of the operating rules of §§ 61.213-61.222 of this subchapter. Also, any pertinent descriptions of the conditions, air speeds, etc., under which the above data were determined.

(b) *Flap controls.* Adequate instructions for the use and adjustment of the flap controls necessary to obtain the desired performance.

(c) *Air speeds.* The indicated air speeds corresponding to those determined in §§ 4b.94-4b.97 Take-off, together with pertinent discussion of procedures to be followed if the critical engine becomes inoperative during take-off.

(d) *Miscellaneous.* Include a discussion of any significant or unusual flying or ground handling characteristics, knowledge of which would be useful to a pilot who has not previously flown the airplane and which would thereby enable him more readily to obtain maximum performance.

SUBPART H—AIRPLANE IDENTIFICATION DATA

§ 4b.931 *Name plate.* A name plate shall be securely attached and shall contain:

- The manufacturer's name and address,
- Model and serial numbers,
- Date of manufacture,
- Type certification number.

§ 4b.932 *Airworthiness certificate number.* The identifying symbols and registration numbers shall be permanently affixed to the airplane structure in compliance with § 43.10 (c) and (d) of this subchapter.

AUTHORITY: §§ 6.1 to 6.61 issued under sec. 205 (a), 52 Stat. 984; 49 U. S. C. 425 (a). Interpret or apply sec. 601, 52 Stat. 1007; 49 U. S. C. 551.

SOURCE: §§ 6.1 to 6.61 contained in Amendment 06-0, Civil Air Regulations, 11 F. R. 6963, except as noted following sections affected. Redesignated by SR-327, 13 F. R. 5488.

GENERAL

§ 6.1 *Scope.* In order to become eligible for type and airworthiness certificates, a rotorcraft shall be shown to

comply with the airworthiness requirements set forth in this part and shall have no characteristic which, according to the findings of the Administrator, renders the rotorcraft unairworthy: *Provided, That:*

(a) If any of the requirements in this part become inapplicable to a particular rotorcraft because of increased knowledge of aeronautics or of the development of unforeseen design features, the Administrator shall accept designs shown to provide an equivalent standard of safety.

(b) Requirements of the U. S. Army or Navy, with respect to airworthiness found by the Administrator to provide an equivalent standard of safety, may be accepted in lieu of the requirements set forth in this part.

Unless otherwise specified, compliance with any amendment to this part shall be mandatory only for rotorcraft for which application for a type certificate has been received subsequent to the effective date of such amendment.

§ 6.2 Type certificate. A type certificate will be issued when the following requirements are met:

(a) *Data required for NC (standard) and NR (restricted) certification.* The applicant for a type certificate shall submit to the Administrator the following: Such descriptive data, test reports, and computations as are necessary to demonstrate that the rotorcraft complies with the airworthiness requirements. The descriptive data shall be known as the type design and shall consist of drawings and specifications disclosing the configuration of the rotorcraft and all design features covered in the airworthiness requirements as well as sufficient information on dimensions, materials, and processes to define the strength of the structure. The type design shall describe the rotorcraft in sufficient detail to permit the airworthiness of subsequent rotorcraft of the same type to be determined by comparison with the type design.

(b) *Inspection and tests for NC and NR certification.* The authorized representatives of the Administrator shall have access to the rotorcraft and may witness or conduct such inspections and tests as are necessary to determine compliance with the airworthiness requirements.

(1) *Inspection.* Inspections and tests shall include all those found necessary by the Administrator to insure that the airplane conforms with the following:

(i) All materials and products are in accordance with the specification given in the type design.

(ii) All parts of the rotorcraft are constructed in accordance with the drawings contained in the type design.

(iii) All manufacturing processes, construction, and assembly are such that the design, strength, and safety contemplated by the type design will be realized in service.

(2) *Flight tests.* Upon satisfactory completion of all necessary inspection and testing on the ground, and upon receipt from the applicant of a report of flight tests conducted by him, and satisfactory proof of the conformity of the rotorcraft with the type design, such

official flight tests as the Administrator finds necessary to prove compliance with this part shall be conducted.

[Amdt. 06-0, 11 F. R. 6963, 7565, as amended by Amdt. 06-2, 13 F. R. 2966]

§ 6.3 Airworthiness certificates. Airworthiness certificates are classified as follows:

(a) *NC certificates.* In order to become eligible for an NC certificate the rotorcraft shall be shown to comply with all of the requirements contained in this part.

(b) *NR certificates.* NR certification is applicable to rotorcraft intended to be operated for restricted purposes not logically encompassed by the requirements of this part. In order to be eligible for an NR certificate, a rotorcraft must be shown to comply with all of the requirements of this part which are not rendered inapplicable by the nature of the special purpose involved, and shall be subject to suitable operating restrictions which the Administrator finds will provide a level of safety equivalent to that contemplated for normal purposes by the requirements of this part.

(c) *NX (experimental) certificates.* A rotorcraft will become eligible for an NX certificate when the applicant presents satisfactory evidence that the rotorcraft is to be flown for experimental purposes and the Administrator finds that it may, with appropriate restrictions, be operated for that purpose in a manner which does not endanger the general public. Rotorcraft used in racing and exhibition flying may be issued NX certificates under the terms of this section. The applicant shall submit sufficient data such as photographs to identify the rotorcraft satisfactorily and upon inspection of the rotorcraft, any pertinent information found necessary by the Administrator to safeguard the general public.

A rotorcraft manufactured in accordance with a type certificate (see § 6.2) and conforming with the type design will become eligible for an NC airworthiness certificate when, upon inspection of the rotorcraft, the Administrator finds it so to conform and in a condition for safe operation. For each newly manufactured rotorcraft this finding shall include a flight check by the applicant.

For rotorcraft manufactured by holders of a production certificate the issuance of an NC airworthiness certificate shall be dependent upon the provisions of Part 2 of this subchapter.

[Amdt. 06-0, 11 F. R. 6963, as amended by Amdt. 06-2, 13 F. R. 2966]

§ 6.4 Changes. Changes shall be substantiated to demonstrate compliance of the rotorcraft with the appropriate airworthiness requirements in effect when the particular rotorcraft was certificated as a type unless the applicant chooses to show compliance with the currently effective requirements subject to the approval of the Administrator, or unless the Administrator finds it necessary to require compliance with current airworthiness requirements.

(a) *Minor changes.* Minor changes to certificated rotorcraft which obviously do not impair the condition of the airplane for safe operation shall be ap-

proved by the authorized representatives of the Administrator prior to the submission to the Administrator of any required revised drawings.

(b) *Major changes.* A major change is any change not covered by minor changes as defined in paragraph (a) of this section.

(c) *Service experience changes.* When the Administrator finds that service experience indicates the need for design changes, the applicant shall submit for the approval of the Administrator engineering data describing and substantiating the necessary changes. The Administrator may in such cases withhold issuance of airworthiness certificates for additional rotorcraft of the type involved until satisfactory corrective measures have been taken. Upon approval by the Administrator, these changes shall be considered as a part of the type design, and descriptive data covering these changes shall be furnished by the applicant to all rotorcraft owners concerned.

(1) In the case of rotorcraft approved as a type under the terms of earlier airworthiness requirements, the Administrator may require that a rotorcraft submitted for an original airworthiness certificate comply with such portions of the currently effective airworthiness requirements as may be necessary for safety.

§ 6.5 Definitions. The following definitions apply to the terms as used in this part:

(a) *Rotorcraft.* Any aircraft deriving its principal lift from one or more rotors.

(b) *Helicopter.* A rotorcraft which depends entirely for its support and motion in the air upon the lift generated by one or more power-driven rotors.

(c) *Gyroplane.* A rotorcraft which depends principally for its support upon the lift generated by one or more rotors which are not power driven, except for initial starting, and which are caused to rotate by the action of the air when the rotorcraft is in motion.

(d) *Main rotor(s).* The main system(s) of rotating airfoils providing sustentation for the rotorcraft.

(e) *Antitorque rotor.* An auxiliary rotor which serves to counteract the effect of the main rotor torque on the rotorcraft.

(f) *Control rotor.* An auxiliary rotor, other than an antitorque rotor, which serves as a device by means of which the rotorcraft can be controlled in flight.

(g) *Plane of rotor disc.* A reference plane at right angles to the mechanical axis of rotation of the rotor.

(h) *Tip speed ratio.* The ratio of the rotorplane flight velocity component in the plane of the rotor disc to the rotational tip speed of the rotor blades.

$$\mu = \frac{V \cos \alpha}{\Omega R}$$

where:

V = air speed of the rotorcraft along flight path (feet per second)

α = angle between flight path and plane of rotor disc

Ω = Angular velocity of rotor (radians per second)

R = rotor radius (feet)

(j) *Load factor, n .* The ratio of any specific load on the rotorcraft to the rotorcraft design weight. When the load in question represents the net external load acting on the aircraft in a given direction, n represents the acceleration in that direction.

(j) *Limit load.* A load which it is assumed, or known, may be experienced but not exceeded in operation. From a design standpoint it is a load which the structure is capable of supporting without detrimental permanent deformations.

(k) *Factor of safety.* A factor by which limit loads are multiplied to obtain ultimate loads.

(l) *Ultimate load.* A load which the structure is capable of carrying without failure (equal to the limit load multiplied by the factor of safety).

(m) *Primary structure.* Those portions of the aircraft the failure of which would seriously endanger the safety of the aircraft.

(n) *Fittings.* Fittings are defined as parts such as end terminals used to connect one structural member to another (see Table 6-1).

[Amdt. 06-0, 11 F. R. 6963, 7565]

§ 6.6 *Approval of materials, parts, processes, and appliances.* Materials, parts, processes, and appliances shall be approved upon a basis and in a manner found necessary by the Administrator to implement the pertinent provisions of this subchapter. The Administrator may adopt and publish such specifications as he finds necessary to administer this section, and shall incorporate therein such portions of the aviation industry, Federal, and military specifications respecting such materials, parts, processes, and appliances as he finds appropriate.

Any material, part, process, or appliance shall be deemed to have met the requirements for approval when it meets the pertinent specifications adopted by the Administrator, and the manufacturer so certifies in a manner prescribed by the Administrator.

[Amdt. 06-1, 12 F. R. 7899]

FLIGHT REQUIREMENTS

§ 6.10 *General.* All rotorcraft shall have such general performance and flight characteristics as to provide reasonable safety during the execution of any maneuver appropriate to, or necessary for, the aircraft and during steady flight at any weight, center of gravity position, speed, and power within the ranges for which the aircraft is certificated. Compliance with all performance requirements shall be demonstrated by suitable flight tests conducted by the applicant and witnessed by a representative of the Administrator of Civil Aeronautics or, at his discretion, conducted by that representative.

§ 6.11 *Landing.* It shall be possible to make a safe landing with all power off.

§ 6.12 *Ground handling.* The rotorcraft shall demonstrate satisfactory ground resonance characteristics.

STRENGTH CRITERIA

§ 6.20 *General.* (a) The primary structure shall be capable of supporting

the ultimate loads without failure and shall be capable of supporting the limit loads for a period of at least 1 minute without detrimental permanent deformations.

(b) *Ultimate loads.* Ultimate loads are those obtained by multiplying the limit loads by the required factor of safety. The factor of safety shall be 1.5, except in cases where an additional (multiplying) factor of safety is specified. In such cases the final factor of safety shall be equal to 1.5 times the additional factor of safety.

(c) *Additional (multiplying) factors of safety.* The additional factors of safety specified in Table 6-1 shall be used where applicable. When more than one additional factor is indicated only the largest need be used.

(d) *Proof of structure.* Structural analyses, load tests, flight tests, dynamic tests, or combinations thereof, shall be made for the purpose of providing proof of compliance with the strength criteria.

(1) *Structural tests.* The following structural tests are required and shall be conducted in such manner as to substantiate clearly compliance with the strength criteria:

(i) Dynamic and endurance tests of rotors and rotor drives, including controls (see § 6.42 (a)),

(ii) Control surface and system tests (limit load and operation tests),

(iii) Vibration surveys (see §§ 6.22 and 6.24 (b)),

(iv) Landing gear drop tests (see § 6.21 (d) (1)),

(v) Such additional tests as may be found necessary by the Administrator to substantiate new and unusual features of the design.

§ 6.21 *Structural loading conditions—*

(a) *General.* The airworthiness rating of a rotorcraft with respect to its strength will be based on the air speeds, rotor speeds, and load factors which can safely be developed in combination. The simultaneous air and rotor speeds which can safely be developed in combination with the specified load factors shall be determined by the applicant and shall serve as a basis for structural loading conditions and, where found necessary by the Administrator, for restricting the operation of the rotorcraft in flight.

(b) *Design limitations.* The following values shall be established by the applicant for purposes of showing compliance with the structural requirements specified in this section:

(1) Maximum design weight, W .

(2) Main rotor maximum tip speed ratio, μ_m (if the tip speed ratio for a helicopter in the autorotation phase exceeds that for power-driven conditions, then the former value shall be used),

(3) Main rotor(s) maximum design revolutions per minute, N .

(4) Auxiliary rotor(s) maximum design revolutions per minute. The limitation selected shall be such as to cover safely all normal operating ranges of the aircraft.

(c) *Flight loading conditions.* The flight load factors specified in subparagraphs (1) and (2) of this paragraph will represent rotor load factors. The net load factor acting at the center

of gravity of the aircraft shall be obtained by proper consideration of balancing loads acting in the specific flight conditions.

(1) *Maneuvering flight conditions.* The rotorcraft structure shall be substantiated for a positive maneuvering limit load factor of 3.5 (resultant force on the rotor(s) equal to 3.5 times the rotorcraft design weight) and a negative maneuvering limit load factor of 1.0, except that lesser values may be used if the manufacturer can prove by analytical study and flight demonstrations that the values selected cannot be exceeded. In no case shall the limit load factors be less than 2.5 positive and 0.5 negative. The resultant force shall be assumed to be applied at the center(s) of the rotor hub(s) and to act in such directions as necessary to represent all critical maneuvering motions of the rotorcraft applicable to the particular type, including flight at the maximum design rotor tip speed ratio under power-on and power-off conditions.

(2) *Gust conditions.* The structure affected shall be substantiated for the loading due to vertical gusts of ± 30 feet per second velocity in conjunction with the critical rotorplane air speeds, including hovering.

(d) *Ground loading conditions.* The structure shall be substantiated for the ground loading conditions specified in the current ANC-2 "Ground Loads Handbook," issued by the Army-Navy-Civil Committee on Aircraft Design Criteria, modified as necessary to suit the type of landing gear employed and character of landing operations undertaken by the rotorcraft. The structure shall be substantiated for a limit load factor not less than two-thirds of the value developed in energy absorption tests specified in subparagraph (1) of this paragraph.

(1) *Energy absorption.* The landing gear shall be capable of absorbing the energy of a free drop from a height of not less than 20 inches measured from the bottom of the tires to the ground, except that a lesser height may be used if the value chosen can be shown to exceed that corresponding to the greatest probable sinking speed at ground contact in power-off landings likely to be made by pilots of average skill. In no case shall the drop height be less than 12 inches. The weight of the rotor blades may be neglected in the drop test. The maximum drop test acceleration developed at the center of gravity shall be determined in the test.

§ 6.22 *Main rotor structure.* The requirements specified in paragraphs (a) to (c) of this section apply to the main rotor assembly(ies) including hub(s) and blades. The structure shall be substantiated for at least the following loading conditions:

(a) The hub(s), blades, blade attachments, and blade controls which are under cyclic flexing or alternating stresses shall be substantiated to demonstrate the airworthiness of these parts under repeated loading conditions associated with normal operation. The vibration stresses of critical metal parts shall be determined in flight and it shall be dem-

onstrated that these stresses do not exceed safe values for continuous operation.

(b) The main rotor structure shall be substantiated for the critical flight condition loads specified in § 6.21 (c). At least the maximum design tip speed ratio condition shall be considered in conjunction with these limit loadings.

(c) The main rotor structure shall be substantiated for the limit loads specified by § 6.21 (c) under conditions of autorotation necessary for normal operation. The rotor r. p. m. used shall be such as to include the effects of altitude.

(d) The rotor blades, hub(s), and flapping hinges shall be substantiated for a loading condition simulating the force of blade impact against its stop during operation on the ground. A limit load acting at the center of gravity of the blade equal to the weight of the blade multiplied by a factor of 2.6" shall be used.

(e) The strength of the rotor assembly shall be substantiated for loadings simulating other critical conditions which may be encountered under normal operation. These shall include "jump-off", rotor "rev-up", and rotor "over-speed" conditions in flight.

§ 6.23 *Fuselage, landing gear, and rotor pylon structure.* The requirements specified hereunder apply to the fuselage, landing gear, and rotor pylon structure. The structure shall be substantiated for at least the following loading conditions:

(a) The structure shall be substantiated for the critical loads specified by § 6.21 (c). The resultant rotor force may be represented as a single force applied at the hub attachment point. Consideration shall be given to the balancing and inertia loads occurring under the accelerated flight conditions. The thrust from auxiliary rotors shall also be considered.

(b) The structure shall be substantiated for the ground loads specified by § 6.21 (d).

(c) The engine mount and adjacent fuselage structure shall be substantiated for loads occurring in the rotorcraft under the accelerated flight and landing conditions, including the effect of engine torque loads. In the case of engines having 5 or more cylinders, the limit torque shall be obtained by multiplying the mean torque by a factor of 1.5. For 4, 3, and 2 cylinder engines the factors shall be 2, 3, and 4, respectively.

§ 6.24 *Controls and control systems.*

(a) The structure of all auxiliary rotors (antitorque and control), fixed or movable stabilizing and control surfaces, and all systems operating any flight controls shall be substantiated in accordance with the provisions of paragraphs (b) to (e) of this section.

(b) *Auxiliary rotor assemblies.* Auxiliary rotor assemblies shall be tested in accordance with the provisions of § 6.42 (a) for rotor drives. In addition, auxiliary rotor assemblies with detachable blades shall be tested for one hour at a speed equal to 1.4 times the speed at which the rotor is driven when the engine is operating at its maximum-except-take-off speed. In the case of auxiliary rotors with metal blades the

vibration stresses shall be determined in flight and it shall be demonstrated that these stresses do not exceed safe values for continuous operation.

(c) *Auxiliary rotor attachment structure.* The attachment structure for the auxiliary rotors shall be substantiated for a limit load equal to the maximum balancing thrust of the rotor acting simultaneously with other loads on the structure occurring under critical maneuvering flight conditions.

The structure shall also be substantiated separately for a limit load equal to the maximum thrust of the rotor or rotors acting simultaneously with the maximum loads in the structure occurring under normal unaccelerated flight and landing conditions.

(d) *Stabilizing and control surfaces.* Stabilizing and control surfaces shall be substantiated for a minimum limit load of 15 pounds per square foot, or for a load due to $C_n = 0.55$ at the maximum design speed, whichever is greater. The load distribution shall closely simulate actual pressure distribution conditions.

(e) *Primary control systems.* From the pilot's compartment to the point of their attachment to the rotor blades (or control areas) manual control systems shall be substantiated for the following minimum limit pilot forces:

(1) Foot type controls: 130 lbs.

(2) Stick type controls: 100 lbs. fore and aft, 67 lbs. laterally (the forces need not be applied simultaneously).

(3) Wheel type controls: 100 lbs. fore and aft, a couple equal to a 53-lb. pilot force applied on opposite sides of the control wheel.

§ 6.25 *Miscellaneous structures.* The strength of all structural items not specifically covered by preceding loading conditions shall be shown to be adequate for their intended purpose. In addition the following specific loading conditions shall be applied:

(a) (1) *Seat loads.* The strength of seats and their attachments to the primary rotorcraft structure shall be substantiated for passenger loads in the accelerated flight and landing conditions based on a standard passenger weight of 170 pounds.

(2) *Safety belt loads.* Structures to which safety belts are attached shall be capable of withstanding an ultimate load of 1,000 lbs. per person applied through the safety belt and directed upward and forward at an angle of 45 degrees with the floor line.

(b) *Local loads.* The primary structure shall be designed to withstand local loads caused by dead weights and by control loads transmitted through attachments. Baggage compartments shall be designed to withstand loads corresponding to the maximum authorized capacity. The substantiation of the adequacy of the structure to withstand dead-weight loads shall include a sufficient number of accelerated flight and landing conditions to insure that the most severe combinations have been investigated.

DETAIL DESIGN AND CONSTRUCTION

§ 6.30 *General.* The primary structure and all mechanisms essential for

the safe operation of the rotorcraft shall not incorporate design details which on the basis of experience the Administrator has found to be unsafe. Certain design features which are essential to the airworthiness of a rotorcraft are hereinafter specified and shall be observed.

(a) *Materials and workmanship.* The primary structure shall be made from materials which experience or conclusive tests have proved to be uniform in quality and strength and to be otherwise suitable for rotorcraft construction. Workmanship shall be of sufficiently high grade as to insure proper functioning of all parts under reasonable service conditions.

(b) *Inspection provisions.* Means shall be provided to permit the examination of such parts of the rotorcraft as require periodic inspection.

(c) *Design of structural parts.* Structural parts shall be designed to avoid stress concentration which may affect adversely the strength of such parts in service, or which may introduce unknown factors into the stress analysis of the structure. Adequate fillets for this purpose shall be provided at all abrupt changes in section. Suitable allowances shall be made in the design for holes and for permissible variations in the location of holes. Joints which are likely to be subjected to appreciable wear shall be designed with replaceable bushings or allowances for oversize bolts or pins.

[Amdt. 06-0, 11 F. R. 6963, 7565]

§ 6.31 *Main rotor blades—(a) Pressure venting and drainage.* Internal pressure venting of the main rotor blades shall be provided. Drain holes shall be provided and, in addition, the blades shall be so designed as to preclude the possibility of water becoming trapped at any section of the blade.

(b) *Stops.* The rotor blades shall be provided with stops, as required for the particular design, to limit the travel of the blades about their various hinges.

NOTE: It is desirable that blades should never hit the droop stops except during starting and stopping the rotor.

(c) *Rotor and blade balance.* Rotors and blades shall be mass balanced to the degree necessary to prevent excessive vibrations and to safeguard against flutter at all speeds up to the maximum forward speed.

NOTE: Based on present design, practice blades should be mass balanced at each spanwise station to such a degree that an increase in blade section angle of attack will produce an increase in pitch reducing moment. (Additional general design information on this subject will be provided as experience with various rotorcraft designs is accumulated.)

§ 6.32 *Stabilizing and control surfaces; dynamic and static balance.* All control surfaces shall be dynamically and statically balanced to the degree necessary to safeguard against flutter at all speeds up to the maximum forward speed.

§ 6.33 *Control systems—(a) Installation.* All control systems shall be designed and installed to provide reasonable ease of operation by the crew and to preclude the probability of inadvertent

operation, jamming, and interference by loose objects and passengers. All pulleys shall be provided with guards.

(b) *Stops.* All control systems shall be provided with stops which positively limit the range of motion of the pilot's controls. Stops shall be capable of withstanding the loads corresponding to the design conditions for the control system.

(c) *Autorotation control mechanism.* The main rotor blade pitch control mechanism shall be so arranged as to permit rapid entry into the autorotative regime of flight in the event of power failure.

§ 6.34 *Landing gear.* (See § 6.21 (d) (1).)

§ 6.35 *Fuselage and cabins—(a) Location of rotors.* All rotors shall be so located as not to endanger persons using passenger doors.

(b) *Pilot compartment.* The pilot compartment shall be so constructed as to afford adequate vision to the pilot under normal flying conditions. In cabin aircraft the windows shall be so arranged that they may be readily cleaned or easily opened in flight to provide forward and downward vision for the pilot.

(c) *Ventilation.* The ventilating system for the pilot and passenger compartments shall be so designed as to preclude the presence of excessive fuel fumes and carbon monoxide. The concentration of carbon monoxide shall not exceed 1 part in 20,000 parts of air under conditions of forward flight or hovering in zero wind. For other conditions of operation, if the carbon monoxide concentration exceeds this value, suitable operating restrictions shall be provided for the information of the crew.

(d) *Baggage compartments.* Each baggage and cargo compartment shall bear a placard stating the maximum allowable weight of contents, as determined by the structural strength of the compartment. Consideration shall be given to the effects of concentrated weights in the baggage compartments. Suitable means shall be provided to prevent the contents of cargo and baggage compartments from shifting.

POWER-PLANT INSTALLATION

§ 6.40 *General.* (a) The power-plant installation is considered to include all components of the rotorcraft which are necessary for its propulsion, with the exception of the structure of the main and auxiliary rotors.

(b) All components of the power-plant installation shall be constructed and installed in such a manner as to assure safe operation of the rotorcraft and shall be provided with all the controls and accessories necessary to assure such operation. Adequate accessibility shall be provided to permit the inspection and maintenance necessary to assure the continued airworthiness of all components of the power-plant installation. Fuel, oil, cooling, or other fluid systems shall be made of materials which, including their normal or inherent impurities, will not react chemically with any fuels, oils, or liquids that are likely to be placed in them.

§ 6.41 *Engine installation—(a) Engines.* The engine shall be of a type which has been type certificated or otherwise found eligible for use in certi-

ficated aircraft. (See Part 13 of this subchapter.)

(b) *Engine vibration.* The engine shall be installed in a manner to preclude harmful vibration of any engine parts or of components of the rotorcraft. It shall be demonstrated by means of a vibration investigation that the addition of the rotor and rotor drive system to the engine does not result in modification of engine vibration characteristics to the extent that the principal rotating portions of the engine are subjected to excessive vibratory stresses. It shall also be demonstrated that no portion of the rotor drive system is subjected to excessive vibratory stresses.

§ 6.42 *Rotor drive mechanism.* The rotor drive mechanism shall incorporate a unit which will automatically disengage the rotor drive and engine from the main and auxiliary rotors in the event of power failure. The rotor drive mechanism shall be so arranged that all rotors necessary for control of the rotorcraft in autorotative flight will continue to be driven by the main rotor(s) after disengagement of the engine and rotor drive from the main and auxiliary rotors.

(a) *Rotor drive and control mechanism endurance test.* (1) The rotor drive and control mechanism shall be tested for not less than 100 hours. The test shall be conducted on the rotorcraft and the power shall be absorbed by the actual rotors to be installed, except that the use of other ground or flight test facilities with any other suitable method of power absorption will be considered satisfactory provided all conditions of support and vibration closely simulate the conditions that would exist during a test on the actual rotorcraft. The endurance test shall consist of the following:

(i) Sixty hours at not less than maximum continuous engine speed in conjunction with maximum continuous engine power. In this test, the main rotor controls shall be set in the position which will give maximum longitudinal cyclic pitch change to simulate forward flight. The auxiliary rotor controls shall be in the position for normal operation under the conditions of the test.

(ii) Thirty hours at not less than 90 percent of maximum continuous engine speed and 75 percent of maximum continuous engine power. The main and auxiliary rotor controls during this test shall be in the same position as for paragraph (a) of this section.

(iii) Ten hours at not less than take-off engine power and speed. The main and auxiliary rotor controls shall be in the normal position for vertical ascent during this test.

(2) All of the tests described in subparagraphs (1) (i), (ii), and (iii) of this paragraph may be conducted either on the ground or in flight. These tests shall be conducted for intervals of not less than 30 minutes except in the case of subparagraph (1) (iii) of this paragraph. The testing of subparagraph (1) (iii) of this paragraph may be accomplished in intervals of 5 minutes or more if desired.

(3) At intervals of not more than every 5 hours during the endurance tests the engine shall be stopped rapidly enough to allow the engine and rotor

drive to be automatically disengaged from the rotors.

(4) Five hundred complete cycles of lateral control and 500 complete cycles of longitudinal control of the main rotors shall be accomplished under the operating conditions as specified in subparagraph (1) (i) of this paragraph. Five hundred complete cycles of control of all auxiliary rotors shall be accomplished under the operating conditions as specified in subparagraph (1) (i) of this paragraph. A complete control cycle is considered to involve movement of the controls from the neutral position, through both extreme positions, back to neutral position. The control cycling may be accomplished during the testing prescribed in subparagraph (1) (i) of this paragraph, or may be accomplished separately. The remainder of the testing prescribed in subparagraphs (1) (i) and (ii) of this paragraph shall be accomplished with the main rotor controls in the position which will give maximum longitudinal cyclical pitch change to simulate forward flight and with the auxiliary rotor controls in the position for normal operation under the conditions of the test. The part of the endurance test specified in subparagraph (1) (iii) of this paragraph shall be accomplished with the main rotor controls neutral and the auxiliary rotor controls in the position for normal operation in a vertical ascent under the power conditions of this portion of the test. Such additional dynamic, endurance, and operational tests or vibratory investigations shall be conducted as are found necessary by the Administrator to substantiate the airworthiness of the rotor drive mechanism.

(b) *Shafting critical speeds.* An investigation shall be made to determine that the critical speeds of all shafting lie outside the range of permissible engine speeds under idling, power-on, and autorotation conditions. It shall be demonstrated by actual operation that this condition is satisfied with the mechanism installed in the rotorcraft.

[Amtd. 06-0, 11 F. R. 6963, 7565]

§ 6.43 *Fuel systems—(a) Capacity and feed.* The fuel capacity shall be not less than 0.15 gallon per maximum (continuous) horsepower for which the rotorcraft is to be certificated. Air-pressure fuel systems shall not be used. Only gravity feed or mechanical pumping of fuel is permitted. The system shall be so arranged that, insofar as practicable, the entire fuel supply may be utilized in the steepest climb and at the best gliding angle and so that the feed ports will not be uncovered during normal maneuvers involving moderate rolling or sideslipping. The system shall also feed fuel promptly after one tank has run dry and another tank is turned on. If a mechanical pump is used, an emergency pump shall also be installed and shall be available for immediate use in case of a mechanical pump failure. Pumps of adequate capacity may also be used for pumping fuel from an auxiliary tank to a main fuel tank.

(b) *Tank installation.* Fuel tanks shall be separated from the engine compartment by a fire wall. At least one-

half inch clear air space shall be provided between the tank and fire wall. Spaces adjacent to the surfaces of the tank shall be ventilated so that fumes cannot accumulate in the tank compartment in case of leakage. If two or more tanks have their outlets interconnected they shall be considered as one tank. The air spaces in such tanks shall be interconnected to prevent the flow of fuel from one tank to another as the result of a difference in pressure in the respective tank air spaces. Mechanical pump systems shall be so arranged that they cannot feed from more than one tank at a time.

(c) *Tank construction.* Each fuel tank shall incorporate a sump and drain located at the point in the tank which is lowest when the rotorcraft is in its normal ground position. The main fuel supply shall not be drawn from the bottom of this sump. All fuel tank outlets shall be provided with large-mesh finger strainers. Each tank shall be suitably vented from the top portion of the air space. Such air vents shall be arranged to minimize the possibility of stoppage by dirt or ice formation. Tanks of 10 gallons or more capacity shall be provided with internal baffles unless suitable external support is provided to resist surging.

(d) *Tank strength.* Fuel tanks shall be capable of withstanding, without failure or leakage, an internal pressure of either $3\frac{1}{2}$ pounds per square inch, or the pressure developed during the maximum limit acceleration with fuel tanks, whichever is greater. Tanks shall be capable of withstanding, without leakage or failure, all vibration, inertia, and fluid loads to which they may be subjected in normal operation.

(e) *Fuel quantity gauge.* The fuel quantity gauge shall be so installed as to indicate readily to a pilot or a flight mechanic the quantity of fuel in each tank while in flight. When two or more tanks in a gravity feed system are closely interconnected and vented, and it is impossible to feed from each one separately, only one fuel quantity gauge need be installed. If a glass gauge is used, it shall be suitably protected against breakage.

(f) *Lines and fittings.* (1) All fuel lines and fittings shall be of sufficient size so that the fuel flow, with the fuel being supplied to the carburetor at the minimum pressure for proper carburetor operation, is not less than the following:

(i) For gravity feed systems; double the normal flow required to operate the engine at take-off power;

(ii) For pump systems: $1\frac{1}{2}$ times the normal flow required to operate the engine at take-off power.

(2) A test for proof of compliance with the applicable flow requirements shall be conducted.

(3) All fuel lines shall be supported to prevent excessive vibration and should be located so that no structural loads can be applied. Bends of small radius or vertical humps in the lines shall be avoided. Copper fuel lines which have been bent shall be annealed before installation. Lines which are connected to components of the rotorcraft between which relative motion may exist shall in-

corporate provisions for flexibility. Flexible hose and fittings used in fuel line connections shall be of an approved type.

(g) *Strainers.* A strainer incorporating a sediment trap and drain shall be provided in the fuel system between the fuel tanks and the engine and shall be installed in an accessible position. The screen shall be easily removable for cleaning. If an engine-driven fuel pump is provided, the strainer shall be located between the fuel tank and the pump.

(h) *Valves.* A positive and quick-acting valve that will shut off all fuel to each engine individually shall be provided. The control for this valve shall be within easy reach of appropriate flight personnel. In the case of rotorcraft employing more than one source of fuel supply, provision shall be made for independent feeding from each source. The shut-off valve shall not be located closer to the engine than the remote side of the fire wall.

(i) *Drains.* One or more accessible drains shall be provided at the lowest point in the fuel system to drain completely all parts of the system when the rotorcraft is in its normal position on level ground. Such drains shall discharge clear of all parts of the rotorcraft and shall be equipped with suitable safety locks to prevent accidental opening.

(j) *Miscellaneous fuel system requirements—*(1) *Filler openings.* All fuel tank filler openings shall be plainly marked with the capacity, the word "fuel", and the minimum allowable fuel octane number for the engine installed. Provision shall be made to prevent fuel overflow from entering the compartments in which the fuel tanks are located.

(2) *Carburetor de-icing and anti-icing provisions.* Provisions shall be incorporated for preventing the formation and for the elimination of ice in the engine air induction system in accordance with the following:

(i) Rotorcraft employing sea level engines with conventional venturi carburetors shall be equipped with a carburetor air preheater capable of providing a heat rise of not less than 90° F. when the engine is operating at 75 percent of its maximum continuous power in air at a temperature of 30° F.

(ii) Rotorcraft employing altitude engines with conventional venturi carburetors shall be equipped with a carburetor air preheater capable of providing a heat rise of not less than 120° F. when the engine is operating at 75 percent of its maximum continuous power in air at a temperature of 30° F.

(iii) Rotorcraft employing altitude engines with carburetors embodying features which tend to prevent ice formation in the induction system shall be equipped with either one of the following:

(a) A carburetor air preheater capable of providing a heat rise of not less than 100° F. when the engine is operating at 75 percent of its maximum continuous power in air at a temperature of 30° F., or

(b) A carburetor air preheater capable of providing a heat rise of not less than 40° F. when the engine is operating at 75 percent of its maximum contin-

uous power in air at a temperature of 30° F., together with a fluid de-icing system. [Amdt. 06-0, 11 F. R. 8963, 7565]

§ 6.44 *Lubrication systems—*(a) *General.* Each engine shall have an independent oil supply. The oil capacity of the system shall be not less than either 1 gallon for every 25 gallons of fuel or 1 gallon for each 100 maximum (continuous) rated horsepower of the engine or engines, whichever capacity is greater. When suitable provisions are made to transfer oil between engines in flight or when a suitable reserve supply is provided the use of a smaller capacity oil system may be permitted. The suitability of the lubrication system shall be demonstrated in flight tests in which engine temperature measurements are obtained. The system shall provide the engine with an ample quantity of oil at a temperature suitable for satisfactory engine operation.

(b) *Tank installation.* Oil tanks shall be vented and shall be provided with an expansion space which cannot be inadvertently filled with oil. The expansion space shall be at least 10 percent of the total tank volume, except that it shall in no case be less than one-half gallon.

(c) *Tank strength.* Oil tanks shall be capable of withstanding an internal test pressure of 5 pounds per square inch without failure or leakage. Tanks shall be capable of withstanding, without leakage or failure, all vibration, inertia, and fluid loads to which they may be subjected in normal operation.

(d) *Quantity gauge.* A suitable means shall be provided to determine the amount of oil in the oil tanks during the filling operation.

(e) *Piping.* Oil piping shall have an inside diameter not less than the inside diameter of the engine inlet or outlet and shall have no splices between connections. All oil lines shall be so supported as to prevent excessive vibration and should be so located that no structural loads can be applied. Lines which are connected to components of the rotorcraft between which relative motion may exist shall incorporate provisions for flexibility. Flexible hose used in the oil system shall be of an approved type.

(f) *Drains.* One or more accessible drains shall be provided at the lowest point in the lubricating system to drain completely all parts of the system when the rotorcraft is in its normal position on level ground. Such drains shall discharge clear of all parts of the rotorcraft and shall be equipped with suitable safety locks to prevent accidental opening.

(g) *Oil temperature.* A suitable means shall be provided for measuring the oil temperature at the engine inlet during flight.

(h) *Filler openings.* All filler openings in the oil system shall be plainly marked with the capacity and the word "oil".

§ 6.45 *Cooling systems—*(a) *General.* The cooling system shall be capable of maintaining engine temperatures within safe operating limits under all conditions

of flight during a period at least equal to that established by the fuel capacity of the rotorcraft, assuming normal engine power and speeds. Compliance with this requirement shall be demonstrated in flight tests in which engine temperature measurements are obtained under critical flight conditions. Such tests shall be conducted in air at temperatures corresponding to the highest anticipated summer air temperatures as specified in paragraph (b) of this section or, if the flight tests are conducted at temperatures that deviate from these temperatures, the recorded engine temperatures shall be corrected in accordance with the following:

(1) Cylinder head temperatures of air-cooled engines and engine oil inlet temperatures shall be corrected by adding the difference between the highest anticipated summer air temperature and the average temperature of the ambient air at the time of the first occurrence of the maximum cylinder head or oil inlet temperature recorded.

(2) Cylinder barrel temperatures of air-cooled engines shall be corrected by adding seven-tenths of the difference between the highest anticipated summer air temperature and the average temperature of the ambient air at the time of the first occurrence of the maximum cylinder barrel temperature recorded.

(b) *Highest anticipated summer air temperatures.* The temperatures employed in correcting engine temperatures observed in flight tests conducted to show compliance with the requirements of paragraph (a) of this section, shall be 100° F. at sea level and shall decrease from that value at the rate of 3.6° F. per thousand feet above sea level.

(c) *Radiators.* Radiators shall be so mounted as not to induce vibrations and strains causing distortion.

(d) *Piping.* Piping and connections shall conform to accepted standards and by their presence shall not induce vibration to the radiator or to the structure of the rotorcraft.

(e) *Drains.* One or more accessible drains shall be provided at the lowest point in any liquid cooling system to drain completely all parts of the system when the rotorcraft is in its normal position on level ground. Such drains shall discharge clear of all parts of the rotorcraft and shall be equipped with suitable safety locks to prevent accidental opening.

(f) *Filler openings.* All filler openings in the cooling system shall be plainly marked with the capacity of the system and the name of the proper cooling liquid.

§ 6.48 *Power-plant instruments, controls, and accessories—(a) Instruments.* The engine instruments required are specified in § 6.52.

(b) *Controls.* All power-plant controls, including those of the fuel system, shall be plainly marked to show their function and method of operation.

(1) *Throttle controls.* Throttle controls shall be easily accessible to both pilots and shall be so arranged as to afford a positive and immediately responsive means of controlling all engines both separately and simultaneously. Flexible throttle control systems shall be of an approved type. Throttle controls may be

combined with the main pitch control if desired.

(2) *Ignition switches.* Ignition switches shall be easily accessible to both pilots. A positive means for shutting off quickly all ignition of multiengine rotorcraft, by grouping of switches or otherwise, shall be provided.

§ 6.47 *Manifolding, fire wall, and cowlings or engine compartment covering—(a) General.* All manifolds, cowlings, and fire walls shall be so designed and installed as to reduce to a minimum the possibility of fire either during flight or following an accident and shall comply with accepted practice in all details of installation not hereinafter specified.

(b) *Exhaust manifolds.* Exhaust manifolds shall be constructed of suitable materials, shall provide for expansion, and shall be so arranged and cooled that local hot points do not form. Exhaust gases shall be discharged clear of the cowlings, rotorcraft structure, carburetor air intake, and fuel system parts or drains. Exhaust gases shall not discharge in a manner that will impair pilot vision at night due to glare. No exhaust manifolding shall be located immediately adjacent to or under the carburetor or fuel system parts unless such parts are properly protected against possible leakage.

(c) *Air intakes.* Carburetor air intakes shall be provided with suitable drains. Cold air intakes shall open completely outside the cowlings unless the emergence of backfire flames is positively prevented. The air intake drain shall not discharge fuel in the possible path of exhaust flames.

(d) *Fire wall.* (1) The engine compartment shall be isolated from the remainder of the rotorcraft by means of fire-resistant bulkheads unless the engine is located in a nacelle which is remote from the remainder of the rotorcraft structure and contains no fuel tanks. The fire walls shall be constructed of one of the following materials, or of a material of equivalent fire-resistant qualities and strength characteristics:

(i) A single sheet of heat and corrosion-resistant steel not less than 0.012 inch thick;

(ii) A single sheet of nickel-chromium-iron alloy not less than 0.015 inch thick;

(iii) A single sheet of low carbon steel not less than 0.018 inch thick, coated with aluminum or otherwise protected against corrosion;

(iv) A single sheet of monel metal not less than 0.018 inch thick;

(v) A single sheet of terneplate not less than 0.018 inch thick;

(vi) Two sheets of aluminum alloy, each not less than 0.020 inch thick, which are separated by a sheet of asbestos mill-board or asbestos fabric sheet not less than 0.125 inch thick, the entire assembly being adequately fastened together.

(2) The fire wall shall have all necessary openings provided with close-fitting, fire-resistant grommets, bushings, or fire wall fittings. Adjacent inflammable structural members or other inflammable components of the rotorcraft shall be protected by asbestos or other fire-resistant material and provisions shall be made to prevent fuel and oil from permeating the insulation.

(e) *Engine cowlings and engine compartment covering.* All cowlings or engine compartment covering shall be made of noninflammable material and shall be so arranged that any accumulations of dirt, waste, fuel, or oil may be readily observed without complete removal of the cowlings or engine compartment covering. The cowlings or covering shall fit tightly to the fire wall. However, openings may be provided if the surface of the aircraft within 15 inches of all such openings is protected with metal or other suitable fire-resistant material. The cowlings or engine compartment shall be completely drainable in all operating attitudes of the rotorcraft. All drains shall discharge clear of the exhaust manifold, the path of the exhaust gases, and all parts of the rotorcraft.

(f) *Heating systems.* Heating systems involving the passage of cabin air over or in close proximity to engine exhaust manifolds shall not be used unless adequate precautions are incorporated in the design to prevent the introduction of carbon monoxide into the cabin or pilot compartment. Heat exchangers shall be constructed of suitable materials, shall be cooled adequately under all conditions, and shall be susceptible to ready disassembly for inspection.

§ 6.47-1. *Fire-resistant aircraft material (CAA rules which apply to § 6.74 (e)).* See § 4b.448-3 of this subchapter.

[Supp. 1, 13 F. R. 7737]

§ 6.48 *Fire protection—(a) Power-plant installation.* The power-plant installation shall be constructed and installed in such a manner as to preclude the possibility of fire.

(b) *Fire protection of flight controls.* All primary flight controls passing through the engine compartment shall be constructed of fire-resistant material, or shall be enclosed in a suitably ventilated and drained enclosure of 0.012 inch thick stainless steel, or material of equivalent fire-resistant qualities.

EQUIPMENT

§ 6.50 *General.* The equipment required shall be dependent upon the type of operation for which certification is desired. Basic minimum requirements are set forth below.

§ 6.51 *Acceptability.* Equipment items for which certification is required shall be certificated in accordance with the provisions of Part 15 of this subchapter. Other items of equipment shall be of a type and design found by the Administrator to be adequate for the purpose intended.

[Amdt. 06-0, 11 F. R. 6963, 7565]

§ 6.52 *Minimum equipment.* All rotorcraft shall be equipped with at least the following:

(a) An air-speed indicator.

(b) An altimeter.

(c) A tachometer for the main rotor or for each main rotor, the speed of which can vary appreciably with respect to another main rotor. (See § 6.53 (b).)

(d) A tachometer for each engine. (See § 6.52 (b).)

(e) An engine oil-pressure gauge when the engine employs a pressure oil system.

(f) A coolant thermometer for each liquid-cooled engine.

(g) An oil inlet temperature thermometer.

(h) A manifold-pressure gauge for each altitude engine.

(i) A fuel quantity gauge. (See § 6.43 (e) for requirements.)

(j) Certificated safety belts for all passengers and members of the crew. (See Part 15 of this subchapter for belt requirements and § 6.25 (a) (1) for installation strength requirements.)

(k) A device for measuring or indicating the amount of oil in the tanks. (See § 6.44 (d) for requirements.)

§ 6.52-1 *Air-speed indicators and altimeters (CAA rules which apply to § 6.52).* See §§ 4b.691-1 and 4b.691-8 of this subchapter.

[Supp. 1, 13 F. R. 7737]

§ 6.53 *Installation requirements—(a) General.* The required equipment shall be so installed as to function dependably.

(b) *Rotor and engine tachometers.* The tachometers required by § 6.52 (c) and (d) may be combined in a single instrument; however, such an instrument shall indicate rotor rpm during autorotation.

OPERATIONAL DATA

§ 6.60 *Operation limitations and information.* A flight manual shall be provided in the rotorcraft by which the operating personnel are informed of all operation limitations and information necessary for its safe operation. The manual shall include information essential to the proper maintenance of the rotorcraft.

§ 6.61 *Identification plate.* An identification plate shall be permanently affixed in a visible location in the pilot compartment of each rotorcraft. This plate shall contain the manufacturer's name, the model designation of the rotorcraft, its date of manufacture, and the manufacturer's serial number.

TABLE 6-1

[Additional (multiplying) factors of safety. See § 6.20 (c)]

Item	Component	Additional factor of safety	May be covered by item No.
1	Fittings (except control system fittings). ¹	1.15	2, 3, 4, 5, 6, 7.
2	Castings. ²	2.00	3, 4, 5.
3	Rotor hubs and blade attachments.	See § 6.22 (d).	
4	Control system joints (plain bearings). ³	6.67	
5	Control surface hinges (plain bearings). ³	1.50	
6	Torque tubes in direct bearing used as hinges.	1.50	
7	Ball and roller bearings in primary systems.	(4)	

¹ Fittings are defined as parts used to connect one primary member to another and shall include the bearing of those parts on the members thus connected. Continuous joints in metal plating and welded joints between primary structural members are not classified as fittings.

² A lower value than 2 will be acceptable where radiographic inspection is employed in accordance with a process specification approved by the Administrator.

³ For bearing stresses only.

⁴ For ball or roller bearings the manufacturer's non-Brinell rating shall equal or exceed the limit load.

PART 9—AIRCRAFT AIRWORTHINESS; LIMITED CATEGORY

Sec.

9.1 Aircraft category.

9.2 Type certificate; requirements for issuance.

9.3 Airworthiness certificate.

AUTHORITY: §§ 9.1 to 9.3 issued under sec. 205 (a), 52 Stat. 984; 49 U. S. C. 425 (a). Interpret or apply sec. 601, 52 Stat. 1007; 49 U. S. C. 551.

SOURCE: §§ 9.1 to 9.3 contained in Civil Air Regulations, Amendment 09-0, 11 F. R. 14098, except as noted following section affected. Redesignated by SR-327, 13 F. R. 5486.

NOTE: This part is for the purpose of making available to the public certain military surplus aircraft which were originally designed for the military services of the United States for combat and other specialized purposes and which experience in military service has shown to be safe for operation so long as the operation is confined to flights in which neither passengers nor cargo are carried for hire.

§ 9.1 *Aircraft category.* Aircraft certificated in accordance with this part shall be classified in the limited category, suffix "L".

§ 9.2 *Type certificate; requirements for issuance.* A type certificate will be issued if the Administrator finds:

(a) The aircraft is of a make and model which was originally designed and has been manufactured for, and accepted for use by, the military services of the United States for combat or other specialized purposes.

(b) There is no civilian aircraft of essentially the same basic model for which an approved type certificate has been issued.

(c) That information obtained from the record of operation of the make and model as a military aircraft does not disclose any characteristics which would render it unsafe when operated as a civil aircraft in accordance with the limitations and conditions prescribed by the Administrator.

(d) Application is made for the type certificate prior to December 31, 1947.

§ 9.3 *Airworthiness certificate—(a) Requirements for issuance.* A limited airworthiness certificate will be issued by the Administrator for an aircraft eligible for a type certificate under this part if he finds, after inspection, that the aircraft is in a good state of preservation and repair and is in a condition for safe operation. Such inspection shall include a flight check by the applicant. Limited airworthiness certificates shall not be issued after August 31, 1948, to any aircraft which has not previously been so certificated.

(b) *Limitations.* The Administrator shall prescribe in the aircraft operating record such limitations and conditions as are necessary for safe operation of the aircraft.

[Amtd. 09-2, 13 F. R. 4999]

PART 13—AIRCRAFT ENGINE AIRWORTHINESS¹

GENERAL

Sec.

13.1 Scope.

13.2 Deviation.

13.3 Acceptance of Army or Navy requirements.

13.4 Inspection.

AIRWORTHINESS REQUIREMENTS

13.20 Design and construction.

13.21 Block testing.

13.22 Identification plate.

13.23 Demonstration of compliance.

TYPE CERTIFICATE

13.30 Requirements.

13.31 Data required.

13.32 Changes.

13.33 Manufacturer's instructions.

AUTHORITY: §§ 13.1 to 13.33 issued under sec. 205 (a), 52 Stat. 984; 49 U. S. C. 425 (a). Interpret or apply sec. 601, 52 Stat. 1007; 49 U. S. C. 551.

SOURCE: §§ 13.1 to 13.33 contained in Amendment 116, Civil Air Regulations, 6 F. R. 2868.

GENERAL

§ 13.1 *Scope.* The airworthiness requirements set forth in this part shall be used as a basis for determining the original eligibility of aircraft engines for use in certificated aircraft or for the issuance of type certificates therefor. Aircraft engines, when manufactured in accordance with, and conforming to, the aircraft engine specifications approved and in effect prior to August 1, 1941, of types having satisfactory safety records, will be eligible for use in certificated aircraft if such engines are in condition for safe operation.

§ 13.2 *Deviation.* Deviation from the requirements of this part may be permitted if it is clearly demonstrated that such deviation meets standards equivalent to or in excess of the requirements of this part in insuring safe operation.

§ 13.3 *Acceptance of Army or Navy requirements.* Equivalent requirements of the United States Army or Navy, with respect to airworthiness, may be accepted in lieu of the requirements provided in this part.

§ 13.4 *Inspection.* An authorized representative of the Administrator shall be permitted at any time and place to make such inspections and tests as are necessary to determine compliance with the requirements of this part.

AIRWORTHINESS REQUIREMENTS

§ 13.20 *Design and construction.* The engine shall be designed and constructed to function reliably under all flight and atmospheric conditions when properly installed, operated, and maintained in an aircraft.

(a) *Materials.* The engine shall be made of materials proved by experience or conclusive tests to be uniformly adequate in quality and strength, and otherwise suitable for the parts in which they are used.

¹ Civil Aeronautics Manual 13, which may be secured from the Correspondence Section, Civil Aeronautics Administration, Washington 25, D. C., sets forth in detail the Administrator's interpretations and explanations of the requirements of this part.

(b) *Fire prevention.* The engine shall be so designed and constructed, and materials of such quality shall be used, that the probability of the occurrence and spread of fire because of structural failure, overheating, or other causes, shall be reduced to a minimum.

(c) *Detail design.* The engine shall incorporate only details of design proved by experience or conclusive tests to be reliable and otherwise satisfactory for safe operation.

(1) *Durability.* The wearing surfaces, lubrication system and parts subject to fatigue shall be so designed and constructed that no unsafe condition will develop between overhaul periods when the engine is properly installed, operated and maintained in an aircraft.

(2) *Vibration.* The engine shall be designed and constructed to operate throughout its normal operating range of speeds and powers without excessive stress in the engine parts because of vibration, and without imparting excessive vibration forces to the engine support structure, when the engine is properly installed, operated, and maintained in an aircraft with a suitable flight propeller.

(3) *Fuel and induction system.* (i) The fuel system of the engine shall be designed and constructed to supply a satisfactory mixture under all flight and atmospheric conditions, during idling, acceleration, take-off, flight, and landing, when the engine is properly installed, operated, and maintained in an aircraft.

(ii) The intake passages of the engine through which air, or fuel in combination with air passes, for combustion purposes, shall be designed and constructed, insofar as possible, to avoid formation of ice deposits in such passages. The engine shall be designed and constructed so as to permit the use of a satisfactory means of ice prevention.

(4) *Ignition system.* All spark ignition engines shall be equipped with, (i) a dual ignition system having at least two spark plugs per cylinder and two separate electrical circuits having separate sources of electrical energy, or (ii) an ignition system which will function with equal reliability in flight.

(5) *Lubrication system.* The lubrication system of the engine shall be so designed and constructed that the system will function properly in all flight attitudes and atmospheric conditions in which the engine is intended to be used. In wet sump engines, such requirement shall be met when only one-half the maximum oil supply is in the engine. The system shall be so designed and constructed that provision can readily be made for properly cooling the oil.

(6) *Engine cooling.* The engine shall be designed and constructed to provide satisfactory cooling when the engine is properly installed, operated, and maintained in an aircraft.

(7) *Engine and accessory mounting attachments.* (i) The mounting attachments and structure of the engine shall have sufficient strength, when the engine is properly supported by a suitable engine mount structure, to meet the structural loading conditions of Part 4 of this subchapter, and to withstand vibration forces likely to occur.

(ii) Accessory mounting provisions and drives shall be designed and constructed to provide for the safe operation of the engine with the accessories attached. All essential engine accessories which may require inspection, adjustment, or removal between engine overhauls shall be mounted in such manner that they may be readily inspected, adjusted, or removed without disassembly of the engine.

§ 13.21 *Block testing.* The engine, including at least essential accessories, shall satisfactorily complete block testing as provided in this section under power outputs and conditions simulating the most severe flight operations possible when the engine is properly installed, operated and maintained in an aircraft. Separate engines of identical design and construction may be used for the endurance, calibration, and operation tests.

(a) *Testing equipment and personnel.* The applicant shall furnish suitable testing equipment and facilities, and competent personnel to conduct the required block tests.

(b) *Witnessing of tests.* An authorized representative of the Administrator shall witness all block testing sufficiently to ascertain that the information presented in the applicant's test report is substantially correct and complete. Such representative shall witness, in their entirety, the operation test, the calibration test, the tear-down inspection, and at least the last 50 hours of the endurance tests.

(c) *Engine operating conditions and limitations.* The engine operating conditions maintained within suitable tolerances or satisfactorily demonstrated during the testing shall determine the operating limitations to be assigned the engine by the Administrator. Such operating limitations shall include those necessary or advisable for safe operation of the engine, and may be placed on the following and any necessary additional items: power output, crankshaft speed, manifold pressure, spark and mixture settings, fuel and oil grades, and cylinder head, barrel, intake air, and oil inlet temperatures.

(d) *Calibration tests.* The engine shall be subjected to such calibration tests as are necessary to establish its power characteristics and the conditions under which it is to be endurance tested. Such tests shall cover, but need not be limited to, the proposed cruising, maximum-except-take-off, and take-off operating conditions.

(e) *Operation tests.* The engine shall be operated at various power outputs and speeds throughout the proposed operating range to demonstrate that the engine has satisfactory running and vibration characteristics, and freedom from detonation.

(f) *Endurance tests.* The endurance tests shall consist of the following 150 hours of testing on the same engine, in the order stated: (1) 50 hours at maximum-except-take-off power, (2) 50 hours at the most critical cruising conditions, (3) 40 hours at 91 percent take-off power or at least maximum-except-take-off power, and (4) 10 hours at take-off power. Such endurance tests shall be

conducted in periods of not less than 30 minutes duration.

(1) *Engine adjustments and parts replacements.* (i) External adjustments and replacements of minor parts such as spark plugs, which are normally made in servicing aircraft engines, may be performed at reasonably spaced servicing periods designated in advance by the applicant.

(ii) Minor internal adjustments and replacements of minor parts, which are normally made during a top overhaul, may be performed during the optional 100-hour tear-down inspection.

(iii) The tests shall not be considered satisfactory if excessive adjustments or excessive replacements of minor parts are made, unless it is demonstrated that the causes therefor have been remedied.

(iv) Parts used to replace other parts, except as permitted by (i) and (ii) of this subparagraph, shall satisfactorily meet the 150-hour endurance tests: *Provided*, That the Administrator may accept other substantial equivalent proof of such parts.

(2) *Forced stops.* A forced stop is any malfunctioning of the engine or its essential accessories which would cause or make advisable an engine stop, including, but not limited to, structural failure, excessive increase in vibration, excessive leaking of fuel, oil, or coolant, or an appreciable decrease in performance not attributable to general wear or change in atmospheric conditions. When a forced stop occurs, appropriate corrective measures shall be taken to insure insofar as possible that similar malfunctioning will not reduce the reliability of the engine in service.

(g) *Optional tear-down inspection.* The applicant may, but shall not be required to, conduct a tear-down inspection after the completion of the first 100 hours of endurance testing.

(h) *Final tear-down inspection.* (1) At the completion of the endurance tests, the engine shall be completely disassembled and a detailed inspection made of the engine parts. Highly stressed parts shall be examined by suitable methods to determine the presence of hidden fatigue cracks. Wear measurements shall be taken and a comparison made of the final condition of parts and their condition prior to the beginning of the endurance tests or their dimensions as shown on the drawings. A conformity check consisting of a comparison of the parts of the engine tested with the drawings may be required at this time.

(2) If any part shows evidence of fatigue or impending failure or is otherwise not in a condition for safe operation, the engine will not be considered satisfactory unless appropriate corrective measures are taken and proven satisfactory by suitable testings: *Provided*, That the Administrator may accept other substantially equivalent proof.

(i) *Test report.* The applicant shall prepare and submit a suitable report completely covering the required testing of the engine and the tear-down inspections. Such report shall be signed by an authorized representative of the applicant and the authorized representative

of the Administrator who witnessed the testing and tear-down inspections.

§ 13.22 *Identification plate.* A suitable identification plate shall be permanently attached to the engine in a location which will be readily accessible when the engine is installed in an aircraft. Such plate shall contain such pertinent information as may be prescribed by the Administrator.

§ 13.23 *Demonstration of compliance.* Compliance with the airworthiness requirements of this part shall be substantiated insofar as practicable by pertinent technical data and inspections. Analyses or additional tests satisfactory to the Administrator shall be made when warranted by unconventional design features or the results of block testing.

TYPE CERTIFICATE

CROSS REFERENCE: For regulations governing issuance of type certificates, see Part 2 of this subchapter.

§ 13.30 *Requirements.* In order to obtain an aircraft engine type certificate an applicant shall comply with the requirements of §§ 13.20-13.23 and §§ 13.31-13.33.

§ 13.31 *Data required.* In addition to the data required to show compliance with the airworthiness requirements, the applicant for a type certificate shall submit descriptive data adequate for the reproduction of other engines of the same type.

§ 13.32 *Changes.* When any change in design, construction, or operating limitations is made in an engine being manufactured under a type certificate, suitable data describing the change shall be submitted for the approval of the Administrator.

(a) *Major changes.* A major change is any change in design, construction, or operating limitations which might have an adverse effect on the reliability or other airworthiness characteristics of an engine. Proof adequate to show that a major change does not have such adverse effect shall be submitted to the Administrator. Engines incorporating major changes shall not be released for service until such changes are approved by the Administrator.

(b) *Minor changes.* A minor change is any change not within the definition of a major change. Adequate data describing each minor change shall be made conveniently available, in the manufacturing plant, to a representative of the Administrator at least by the time such change is released for production. The technical data file formally submitted to the Administrator shall be brought up to date insofar as such minor changes are concerned at least every 6 months.

§ 13.33 *Manufacturer's instructions.* The holder of a type certificate shall, within a reasonable time after receiving such certificate, prepare and submit for approval by the Administrator suitable instructions for the installation, operation, servicing, maintenance, repair and overhaul of the type certificated engine model or models. The holder of a type certificate shall make the approved instructions available to persons

engaged in the operation, maintenance, repair or overhaul of engines manufactured under such certificate and shall prepare, submit for approval, and make available such revisions to the instructions as are found advisable from service experience.

PART 14—AIRCRAFT PROPELLER AIRWORTHINESS

GENERAL

- | | |
|------|---------------------------------|
| Sec. | |
| 14.1 | Provisions for rating. |
| 14.2 | Scope. |
| 14.3 | Hubs and blades. |
| 14.4 | Testing facilities. |
| 14.5 | Military propellers. |
| 14.6 | Propeller operation limits. |
| 14.7 | Propeller identification data. |
| 14.8 | Previously approved propellers. |

DESIGN REQUIREMENTS

- | | |
|-------|-----------------------------|
| 14.10 | Propellers. |
| 14.11 | Surface of propeller blade. |
| 14.12 | Inspection. |

COMMERCIAL PROPELLERS

- | | |
|-------|---|
| 14.20 | Data required. |
| 14.21 | Tests required for propellers other than fixed pitch wood propellers. |
| 14.22 | Tests required for fixed pitch wood propellers. |
| 14.23 | Inspection of a tested propeller. |

PROPELLERS

- | | |
|-------|----------------------|
| 14.30 | Military propellers. |
| 14.40 | Modified propellers. |

PROCEDURE RELATIVE TO TYPE CERTIFICATION

- | | |
|-------|-------------------------|
| 14.50 | General. |
| 14.51 | Sealed drawing list. |
| 14.52 | Major changes. |
| 14.53 | Minor changes. |
| 14.54 | Reductions in diameter. |

AUTHORITY: §§ 14.1 to 14.54 issued under sec. 205 (a), 52 Stat. 984; 49 U. S. C. 425 (a). Interpret or apply sec. 601, 52 Stat. 1007; 49 U. S. C. 551.

SOURCE: §§ 14.1 to 14.54 contained in Civil Air Regulations, May 31, 1938, as amended by Amendment 75, 5 F. R. 3946, except as noted following sections affected.

GENERAL

§ 14.1 *Provisions for rating.* Pursuant to the provisions of the Civil Aeronautics Act of 1938, as amended, empowering and requiring the Civil Aeronautics Board to prescribe such minimum standards governing the design, materials, workmanship, construction, and performance of propellers as may be required in the interest of safety, and to provide for the rating of aircraft as to airworthiness, the requirements hereinafter set forth shall be used as the minimum standards for establishing such rating for propellers for use in certificated aircraft.

[Reg. 601-A-1, 3 F. R. 2052, as amended by Amdt. 75, 5 F. R. 3946]

§ 14.2 *Scope.*—(a) *Airworthiness requisites.* To show eligibility of a propeller for certification the propeller shall meet the requirements of this part as to design, construction, and testing. The manufacturer shall comply with the requirements by the submission of technical data and by conducting tests with suitable test equipment. The applicable requirements are set forth in §§ 14.10-14.40.

(b) *Type certificate.* The general requirements for the issuance of a type

certificate are set forth in Part 2 of this subchapter. The procedure relative to type certification of propellers is set forth in § 14.50.

(c) *Production certificate.* The requirements for the issuance of a production certificate are set forth in Part 2 of this subchapter.

(d) *Deviations.* When a propeller embodies a feature of design or construction which deviates from the practice in conventional screw propeller types, application shall be made to the Administrator for special rulings covering the feature in question.

§ 14.3 *Hubs and blades.* Interchangeable propeller hubs and blades are certificated as separate units and the word "propeller" as used in this part applies, where applicable, to a propeller hub and to a blade as well as to a complete propeller.

§ 14.4 *Testing facilities.* A manufacturer submitting a propeller for certification shall conduct all of the tests and supply or arrange for the testing facilities necessary to show compliance with the requirements contained in this part. When, in the opinion of the Administrator, adequate and satisfactory methods of testing other than those outlined herein are available, propellers tested by such methods may be eligible for certification.

§ 14.5 *Military propellers.* A propeller of a type which has passed the regular endurance tests of and is approved by the United States Department of the Air Force or the Bureau of Aeronautics, Department of the Navy, may be certificated in accordance with § 14.30.

§ 14.6 *Propeller operation limits.* A certificated propeller shall not be operated at a power or propeller shaft speed, or in conjunction with an engine bore, greater than the limits assigned thereto by the Administrator. The Administrator may specify short-time operation in excess of these limits for take-off purposes except that neither the power nor the speed limits will be raised by more than 10 percent without further testing.

§ 14.7 *Propeller identification data.* A certificated propeller, propeller blade, or propeller hub shall have the following information conspicuously displayed upon it: manufacturer's name; name, model designation, and serial number of the propeller. The identification data shall be permanently attached by means of a plate, stamping, engraving, etching, or other such method upon a noncritical surface of the propeller blade or hub. When such data are not visible when the propeller is assembled or installed on an aircraft they shall also be painted or printed on the propeller blade or hub.

[CAR, May 31, 1938, as amended by Amdt. 14-1, 10 F. R. 13199]

§ 14.8 *Previously approved propellers.* The regulations in this part supersede the requirements for approval of propellers set forth in previous regulations. However, propellers rated as suitable for use in approved aircraft in accordance with previous requirements may be used in certificated aircraft at the discretion of the Administrator.

DESIGN REQUIREMENTS

§ 14.10 *Propellers.* Propellers shall be so designed as to operate without excessive vibration or flutter and shall be constructed of materials which are suitable for service conditions.

§ 14.11 *Surface of propeller blade.* The surface of a propeller blade shall be smooth and the blade shall be faired with respect to the thickness and the moments of inertia about the major and minor axes, with no abrupt curvature changes or irregularities along the blade. Critical surfaces of a metal propeller hub shall be machined smooth without tool marks and any change in cross section shall be faired with as large a fillet as possible.

§ 14.12 *Inspection.* It is recommended that a propeller be so designed that the weakest portion of the propeller blade or hub may be inspected without disassembly and that excessive wear or a partial failure will precede a serious type of failure.

COMMERCIAL PROPELLERS

§ 14.20 *Data required.* In the case of a propeller of a type which has not been previously approved by the Department of the Army or Department of the Navy, and for which the manufacturer desires the certification of the Administrator, the following information shall be submitted:

(a) Application for type certificate on a form which will be supplied for the purpose by the Administrator.

(b) A complete set of drawings descriptive of the propeller, which drawings shall be numbered and dated and shall include change letters for each revision. All details of the propeller shall be shown, including the profile and plan form of the blade, the size of blade cross sections at frequent stations, the hub design, and the materials of construction. The material shall be specified on the drawings by reference to specification numbers of the Department of the Army, Department of the Navy, SAE, or other recognized standard whenever possible. If the manufacturer refers to his own specification numbers, details of such specifications shall be furnished the Administrator. All drawings shall be folded to a size of approximately 9 by 12 inches, with the title showing. In order to eliminate a possible source of controversy, the Administrator will not accept drawings which may be altered after approval. Blueprints, photostats, or the equivalent are acceptable. If certain of the drawings required for a particular propeller are identical with drawings previously submitted and approved in connection with a prior type of propeller made by the same manufacturer, such drawings need not be again submitted.

(c) A complete parts list in duplicate, showing the drawing number, change letter, and name of each component part of the propeller. The drawing numbers shall be listed in numerical order. When only one or two drawings are submitted for compliance with paragraph (b) of this section, it is permissible for the manufacturer to submit these drawings in

duplicate in which case a parts list is not required.

(d) A complete log certified to by the person making the test or signed by a witnessing inspector of the Administrator, at the discretion of the Administrator, describing the manufacturer's tests of the propeller in accordance with § 14.21 or § 14.22, as the case may be. The log shall include a detailed record of the test with dates; names of persons involved; name and model number of engine, or name, model number, and identification mark of the airplane issued by the Administrator of Civil Aeronautics; and hours of testing with corresponding engine speeds. The report shall also include the results of a detailed inspection of the propeller after the test in accordance with § 14.23.

(e) A stress analysis when required by § 14.21 (b) or when, in the judgment of the Administrator, the design is sufficiently unconventional to require it.

[CAR, May 31, 1938 as amended by Amdt. 19, 4 F. R. 3391]

§ 14.21 *Tests required for propellers other than fixed pitch wood propellers.*

(a) A propeller of such type shall be subjected to a 50-hour endurance block test on an internal-combustion engine rigidly mounted and of the same characteristics as the engine or engines in conjunction with which the propeller will be certificated for use, or on another engine acceptable to the Administrator. The test shall be witnessed by an authorized inspector of the Administrator and may be run without a stop or in periods of 5 hours or more each. The cylinder bore of the engine used for the test will determine the maximum bore of the engine with which identical propellers of this type will be certificated for use. The test shall be run at the proposed rated speed of the propeller with the propeller so adjusted as to absorb its proposed rated power. If the engine is not run at full throttle, and horsepower measurements are not possible during the test, manifold pressure readings shall be taken at frequent intervals. A suitable calibration curve shall be used to determine the power absorbed by the propeller during the test. The power rating assigned to the propeller by the Administrator may correspond to the corrected horsepower developed by the engine if the engine used for the test is of the type on which the propeller is to be certificated for use. In the case of a controllable or automatic pitch propeller, the pitch-changing mechanism shall be operated throughout the usable power range at least once for each hour of the test or the equivalent. The engine may be throttled to prevent overspeeding when changing pitch. After such 50 hours of testing, a controllable or automatic pitch propeller shall also be operated at as close to rated power and speed as possible for periods of 5 minutes each at various pitch settings, i. e., at 1 degree intervals throughout the operating range when the design so permits. All variations in running characteristics of the propeller shall be recorded.

(b) A propeller of the above type which, in the opinion of the Administrator, is sufficiently similar to a pre-

viously certificated propeller of the same manufacturer may be subjected to a 50-hour flight test in lieu of the test outlined in paragraph (a) of this section: *Provided*, That its airworthiness is demonstrated to the satisfaction of the Administrator by a comparative stress analysis submitted by the manufacturer. The stress analysis shall compare the pertinent aerodynamic, centrifugal, vibration, and torque impulse load differences between the respective propellers by a mathematical comparison, when possible, and by suitable curves plotted with the radius of the propeller as abscissa. Curves descriptive of the fairing of the propellers shall also be included when applicable. Such 50-hour flight test shall be conducted on an engine of equal or greater power and speed than that in conjunction with which the rating is requested. At least 5 hours of the test shall be run at the proposed rated speed of the propeller.

(c) It is recommended that metal propellers of this type also be tested by suitable methods to determine their natural frequencies within all ranges of major vibrations which are produced by the operation of the engines in conjunction with which such propellers are to be certificated for use. Such frequencies should be determined at all blade angles within the desired operating pitch range of propellers. Data covering these tests should be submitted to the Administrator in the form of curves and tables. The type of frequency should be described and the nodes located for each frequency.

§ 14.22 *Tests required for fixed pitch wood propellers.* A propeller of such type shall be subjected to a 10-hour endurance block test on an internal-combustion engine, or to a 50-hour flight test. The testing shall be witnessed by an authorized inspector of the Administrator at the discretion of the Administrator. In the case of a block test the entire test shall be run at the proposed rated speed of the propeller. In the case of a flight test at least 5 hours shall be run at the proposed rated speed of the propeller. Such flight test shall be conducted with an engine of equal or greater power and speed than that in conjunction with which the propeller is to be certificated for use.

§ 14.23 *Inspection of a tested propeller.* As prescribed in § 14.20 (d), the log of the flight or block test shall include the results of a detailed inspection of the propeller after the test. Photographs of any failures or suspected failures shall be included. A propeller which fails during the testing is not eligible for certification unless the failure is of a nature such that the strength of the propeller is not impaired and a minor modification to the propeller will preclude the probability of future failures of the same type. Aluminum-alloy propellers shall be etched at all critical portions and then examined for minute cracks with a magnifying glass. Steel propellers shall be subjected to both a magnetic and visual inspection for signs of failure.

(a) A failure of a metal propeller is defined as actual breakage, cracking or permanent set of any part of any blade,

hub, bolt, lock nut, spline, or keyway; slipping of a blade in its clamping socket; seizing or pitting of any bearing; or jamming of an automatic or controllable pitch mechanism. A wood propeller will be deemed to have failed if the tipping pulls or cracks, if a glue joint opens, or if there is any local failure or crushing around the hub or a bolt. Similar considerations will apply to propellers of any patented composition or of other than conventional wood or metal construction.

PROPELLERS

§ 14.30 *Military propellers.* In the case of a propeller of a type which has previously been approved by the Army or Navy and for which the manufacturer desires certification by the Administrator, the following data shall be submitted:

(a) An application as described in § 14.20 (a).

(b) A copy of the official Army or Navy endurance test report which was the basis for the military approval, signed by the Army or Navy representative who witnessed the tests. It is not necessary for the manufacturer to submit this report when such report has been previously forwarded to the Administrator through official channels. When the report is being prepared by the military agency the Administrator, to expedite approval, may in the interim accept a copy of the official letter of approval of the propeller, which letter shall include the military rating, the length of test, and the output and model designation of the test engine.

(c) Drawings as described in § 14.20 (b).

§ 14.40 *Modified propellers.* When a manufacturer desires the certification by the Administrator of a propeller which embodies only minor modifications of a certificated propeller of the same manufacturer, data shall be submitted as follows:

(a) An application as described in § 14.20 (a).

(b) Drawings as described in § 14.20 (b).

(c) Technical data which demonstrate conclusively that the airworthiness of the modified propeller is at least equal to that of the certificated propeller.

PROCEDURE RELATIVE TO TYPE CERTIFICATION

§ 14.50 *General.* The procedure and general requirements for the issuance of a type certificate shall be as prescribed in Part 2 of this subchapter.

§ 14.51 *Sealed drawing list.* When a type certificate is granted, a drawing list representative of the certificated propeller is impressed with the seal of the Administrator of Civil Aeronautics and is returned to the manufacturer. Sealed copies of the drawings may be used for this purpose in lieu of a drawing list. Inspectors of the Administrator may call for, and must have access to, the sealed drawing list or drawings together with any other pertinent drawings when making an inspection of the manufacturer's plant to determine whether the propellers as built conform to the approved data.

[CAR, May 31, 1938, as amended by Amdt. 75, 5 F. R. 3946]

§ 14.52 *Major changes.* (a) Any major change from the approved drawings must be approved in advance by the Administrator. A change will be deemed major within the meaning of the regulations in this part if it adversely affects the reliability or airworthiness of the propeller. In general, a change will be deemed major when it decreases the airworthiness of a part the failure of which might prevent the aircraft from continuing flight. In all doubtful cases the decision of the Administrator shall establish the category within which a specific change will be included.

(b) Information accompanying a request for approval of a change to a certificated propeller shall include technical data, including (when necessary) stress analyses and reports of tests sufficient to demonstrate to the satisfaction of the Administrator that the changed propeller is airworthy. The report shall be signed and certified to by the responsible representative of the manufacturer. If the change is to a different blade shank size, engine shaft size, blade airfoil, or propeller material, application shall be made for a new type certificate.

[CAR, May 31, 1938, as amended by Amdt. 19, 4 F. R. 3391]

§ 14.53 *Minor changes.* On January 1 and July 1 of each year the holder of a propeller type certificate shall submit, for approval and file, drawings pertaining to all the minor changes made to the propeller during the preceding 6-month period.

§ 14.54 *Reductions in diameter.* A type certificate may provide for reduction in diameter from that of the propeller tested: *Provided*, That no increase in rating is involved. The diameter of a propeller blade may be reduced by cutting off the tip of the blade and fairing the immediate vicinity or by telescoping the outer sections of the blade. The drawings submitted shall show the details of each blade smaller in radius by 6-inch steps, which details may be shown superimposed on a drawing of the original blade.

PART 15—AIRCRAFT EQUIPMENT AIRWORTHINESS

GENERAL

- | | |
|--------|--|
| Sec. | |
| 15.1 | Provision for rating. |
| 15.2 | Scope of regulations. |
| 15.3 | Classification of items of equipment. |
| 15.3-1 | Automatic pilots (CAA rules which apply to § 15.3 (e)). |
| 15.4 | Factors affecting certification or special approval. |
| 15.5 | Identification data. |
| 15.6 | Procedure relative to certification or special approval. |
| 15.7 | Previously approved items of equipment. |

LANDING GEAR EQUIPMENT

- | | |
|-------|----------------------|
| 15.11 | Landing gear wheels. |
| 15.12 | Brakes. |
| 15.13 | Seaplane floats. |
| 15.14 | Skis. |

NAVIGATION APPLIANCES

|-------|------------------|
| 15.20 | Position lights. |
| 15.21 | Landing flares. |

SAFETY EQUIPMENT

- | | |
|-------|---------------|
| 15.30 | Safety belts. |
| 15.31 | Parachutes. |

CONTROL AND STRUCTURAL UNITS

Sec. 15.40 General.

EQUIPMENT ITEMS ADAPTED TO SPECIFIC AIRCRAFT MODELS

- | | |
|-------|--|
| 15.50 | Equipment items adapted to only one aircraft model. |
| 15.51 | Equipment items adapted to any aircraft model by means of detail design changes. |

AUTHORITY: §§ 15.1 to 15.51 issued under sec. 205 (a), 52 Stat. 984; 46 U. S. C. 425 (a). Interpret or apply sec. 601, 52 Stat. 1007; 49 U. S. C. 551.

SOURCE: §§ 15.1 to 15.51 contained in Civil Air Regulations, May 31, 1938, as amended by Amendment 75, 5 F. R. 3946, except as noted following sections affected.

GENERAL

§ 15.1 *Provision for rating.* Pursuant to the provisions of the Civil Aeronautics Act of 1938, as amended, empowering and requiring the Civil Aeronautics Board to prescribe such minimum standards governing appliances, including instruments, equipment, apparatus, parts, appurtenances, or accessories of whatever description, which are used, or are capable of being or intended to be used, in the navigation, operation, or control of aircraft in flight (including parachutes and communication equipment and any other mechanism installed in or attached to aircraft during flight), as may be required in the interest of safety, and to provide for the rating of aircraft and such appliances as to their airworthiness, the requirements herein-after set forth shall be used as the minimum standards for establishing such rating of aircraft appliances for use in certificated aircraft.

[Reg. 601-A-1, 3 F. R. 2053, as amended by Amdt. 75, 5 F. R. 3946]

§ 15.2 *Scope of regulations.* (a) The regulations in this part shall apply to all important items of equipment which are manufactured as complete units and purchased by aircraft manufacturers and operators for use on certificated aircraft, except engines and propellers which are treated separately in Parts 13 and 14 of this subchapter, respectively.

(b) For the purpose of the regulations in this part an item of equipment shall be considered important if, by malfunctioning, it can endanger the safety of the aircraft, or the cargo or passengers in the aircraft, or persons or property beneath the aircraft.

(c) Because the development of aircraft specialties is constantly increasing in scope and variety, there undoubtedly will be developed, from time to time, important items of equipment for which specific provision is not made in the regulations in this part. In such cases the general procedure for certification will be in accordance with the regulations in this part and the manufacturer of the item in question shall apply to the Administrator for special rulings particularly applicable to it.

(d) The general requirements for the issuance of a type certificate are set forth in Part 2 of this subchapter. The procedure relative to type certification is set forth in § 15.6.

(e) The requirements for the issuance of a production certificate are set forth in Part 2 of this subchapter.

§ 15.3 *Classification of items of equipment.* (a) In view of the diversity of items of equipment and the variety of their uses, such items are grouped in two major classifications dependent upon the certification procedure applicable to the particular item.

(1) The certification procedure to be followed is similar for all items and differs only in detail in accordance with the classification within which a particular item lies.

(2) The specific installations in certificated aircraft of certificated items of equipment, irrespective of the classification used in this part, are subject in all cases to approval by the Administrator.

(b) It is desirable to certify a series of similar models of an item of equipment under one certification in order to eliminate as much clerical and identification work as possible. This may be done for some types of wheels, position lights, and other items, a series of which is similar in construction, and differ only in size and relatively unimportant structural details. This procedure may be applied to any item to which the manufacturer can show the procedure applicable.

(c) Items of equipment are classified as follows:

(1) Items of such design that they may be installed and used in any type or model of certificated aircraft, and for which type and production certificates, as defined in Part 2 of this subchapter, may be issued to manufacturers.

(2) Items of such design that they necessarily vary to suit one or more types or models of certificated aircraft in which they may be used. Type and production certificates will not be issued for such items. They will be specially approved as integral parts of the aircraft in which they are installed.

(d) Under paragraph (c) (1) of this section are included items such as the following:

Landing gear wheels.
Seaplane floats, excluding wing-tip floats.
Skis, including pedestals.
Position lights.
Landing flares.
Safety belts.
Parachutes.
Certain types of special flight and engine control units.
Control wheels.
Certain types of tail wheel knuckles.
Certain types of self-locking bolts and nuts, and parts of that general character.

(e) Under paragraph (c) (2) of this section are included items such as the following:

Automatic pilots.
De-icing equipment.
Landing gear shock absorber units.
Autogiro rotor hubs.
Wing ribs.
Fuel and oil tanks.
Engine cowls, wheel streamlines, propeller hub spinners and other special cowlings.
Wing-tip floats.
Structures attaching seaplane floats to aircraft.
Special structures attaching skis to aircraft.
Heating and ventilating systems.

§ 15.3-1 *Automatic pilots (CAA rules which apply to § 15.3 (e)).* See § 4b.705-1 of this subchapter.

[Supp. 1, 13 F. R. 7737]

§ 15.4 *Factors affecting certification or special approval.* (a) All items of equipment falling within the meaning of the regulations in this part, irrespective of their classification, shall:

(1) Satisfactorily fulfill the purpose for which they are intended,

(2) Be free from undue hazard, both in themselves and in their method of operation,

(3) Be constructed of suitable and dependable materials, and

(4) Be manufactured and installed in accordance with the regulations in this subchapter so far as those regulations pertain to the particular item.

(b) Certain of the factors mentioned in paragraph (a) of this section may be demonstrated by drawings and analyses, others by drawings and tests, and others by visual inspection.

§ 15.5 *Identification data.* (a) Each type or model of an item of equipment for which certification is requested shall be assigned a model name or model number by the manufacturer such that it may be distinguished from all other types or models of items of equipment.

(b) Each unit of a certificated or specially approved type or model of equipment item shall be plainly and suitably marked to indicate that it has been certificated or specially approved. The applicable one of the following two methods shall be used to indicate this:

(1) If a type certificate has been issued to the manufacturer for the particular item, each unit shall bear the number of this type certificate.

(2) If a type certificate has not been issued to the manufacturer for the particular item, each unit shall bear the words "Administrator of Civil Aeronautics Approved" or an abbreviation thereof (ACAA).

(c) Each unit of a certificated or specially approved type or model of equipment item shall bear the following identification data:

(1) Manufacturer's name.

(2) Model number or model name.

(3) The serial number or date of manufacture of the particular unit, except that parachutes shall bear at least the date of manufacture.

(4) Administrator of Civil Aeronautics Type Certificate (or ACATC) No. —, or Administrator of Civil Aeronautics Approved (or ACAA).

(5) Such additional information as is specifically provided for in the following regulations:

(d) The data prescribed in paragraph (c) of this section shall be displayed in a conspicuous place on the unit and in such a manner that it may not be easily erased, disfigured, or obscured. Any other information may be added by the manufacturer at his discretion.

[CAR, May 31, 1938, as amended by Amdt. 75, 5 F. R. 3946]

§ 15.6 *Procedure relative to certification or special approval.* (a) A request for certification or approval of a type or model, or, when possible, of a series of similar models of an item of equipment, shall be supported by the data specified in subparagraphs (1) to (4) of this section.

(1) A complete set of drawings descriptive of the item. Drawings of small standard commercial parts need not be submitted, but all other drawings applying to the item, including assembly drawings and, when necessary, installation drawings shall be submitted. The drawings shall contain all dimensions and material specifications of the item. Material shall be specified by reference to a specification number of the Army, Navy, SAE, or other such recognized standard whenever possible. If reference is made to material specifications which are not recognized standards, complete details of such specifications shall be submitted. Revision blocks on drawings shall designate the revision by letter and shall state the nature of the revision, the date and, when serial numbers are used, the serial number of the first unit manufactured in accordance with the revision. Title blocks on drawings shall contain the date of the original issue of the drawing and the drawing number. All drawings shall be folded to a size approximately 9 by 12 inches with the title block showing. In order to eliminate a possible source of controversy, the Administrator will not accept drawings which may be altered after approval. Blueprints, photostats, or their equivalent are satisfactory. These shall not contain pencil or ink notations. If certain of the drawings required for a particular model are identical with drawings previously submitted and approved in connection with a prior model made by the same manufacturer, such identical drawings need not again be submitted.

(2) A list, in duplicate, of all drawings applicable to the item. Such list shall include all drawings previously submitted and approved in connection with prior models made by the same manufacturer, which also apply to the model in question without change. The list shall be arranged in numerical order and shall designate each drawing by number, title, original date of issue, latest revision letter, and the model designation of the item for which the drawing was previously and originally submitted if for other than the model in question. Manufacturers' parts lists, if containing the information specified herein, are acceptable as drawing lists.

(3) Such additional data as are hereinafter prescribed for specific cases.

(4) The list specified in subparagraph (2) of this paragraph need not be submitted if the item for which certification is requested is described by only one or two drawings. In such a case, however, the drawings specified in subparagraph (1) of this paragraph shall be submitted in duplicate.

(b) If the item falls within the classification covered by § 15.3 (c) (1), the data submitted shall include a properly executed formal application for type certificate in accordance with Part 2 of this subchapter.

(c) If the item falls within the classification covered by § 15.3 (c) (2), complete information as to the make and model or makes and models of aircraft in which the item is to be installed shall be furnished, together with an application for special approval on a form which

will be supplied for the purpose by the Administrator. If specific aircraft are involved, the information to be furnished shall include also the serial numbers and aircraft certificate numbers of the aircraft in question.

(d) Items of equipment which comply with the regulations prescribed in this part to the satisfaction of the Administrator may be certificated or approved, as the case may be, for use in certificated aircraft.

(e) If application for a type certificate has been made, certification is also contingent upon compliance with Part 2 of this subchapter to the satisfaction of the Administrator.

(f) Certification is subject to the provisions and restrictions stated on the type certificate and on the specification for the item issued as part of the type certificate, and approval is subject to the provisions and restrictions stated on the specification issued for the aircraft in which the item is installed.

(g) All manufactured units of a certificated or approved item of equipment shall be in exact accordance with the approved drawings and specifications.

(h) Changes or modifications to a certificated or approved item of equipment shall be approved by the Administrator in advance.

(i) A request for approval of a change or modification to a certificated or approved item of equipment shall be supported by revised or new drawings showing the changes; revised drawing list pages, in duplicate, showing the revised or new drawings; and technical data, including reports of any necessary tests, sufficient to demonstrate to the satisfaction of the Administrator that the changed or modified item is airworthy.

§ 15.7 *Previously approved items of equipment.* The regulations in this part supersede the requirements for approval of items of equipment set forth in previous regulations. However, items of equipment rated as suitable for use in approved aircraft in accordance with previous requirements may be used in certificated aircraft at the discretion of the Administrator.

LANDING GEAR EQUIPMENT

§ 15.11 *Landing gear wheels.* (a) Main landing gear wheels will be certificated for a maximum static load which will be determined from the strength of the wheel. Tail wheels will not be certificated.

(1) For the purpose of the regulations in this part main landing gear wheels are considered as those nearest the airplane center of gravity with respect to fore-and-aft location.

(2) For the purpose of the regulations in this part a tail wheel is considered as one which supports the tail of a conventional airplane in the three-point landing attitude.

(b) For wheels other than main landing or tail wheels, application shall be made to the Administrator for special rulings particularly applicable to the cases in question.

(c) The strength of a main landing gear wheel shall be substantiated by the following two static tests:

(1) Radial load test. (See subparagraph (3) of this paragraph.)

(2) Side load test. (See subparagraph (4) of this paragraph.)

(3) The required radial test load is equal to—

$$P \times n \times 1.5 \times 1.15$$

where P is the maximum static load for which approval is requested, n is

$$\frac{9000}{2.80 + 2P + 4000}$$

and is the applied landing load factor for the corresponding airplane, 1.5 is the factor of safety, and 1.15 is a strength test material factor.

(4) The required side test load is equal to—

$$(0.35) \times (\text{the radial test load}).$$

(5) The radial and side loads shall be applied separately and the wheel shall be equipped with the correct size tire inflated to the proper pressure for the load for which certification is requested.

(6) The radial load shall be applied to the wheel in the plane of the tire and may be distributed over a portion of the tire by allowing the tire to bear in a box of firm earth or sand.

(7) The side load shall be applied to the rim of the wheel at its maximum radius and may be distributed over an arc of not more than 30°. In order to insure sufficient strength in the retaining flanges of the rim, all the side load shall be applied to the inner flange in a direction such as to bend it away from the tire. In such case, the load must be increased so that its side component is equal to the load specified in subparagraph (4) of this paragraph. The wheel shall be restrained only by the axle.

(d) A main landing gear wheel shall support the required loads before failure.

(e) The rim contour of a main landing gear wheel shall conform to the Tire and Rim Association's standards or recommendations unless the wheel is to be used in conjunction with a specially constructed tire.

(f) A landing gear wheel may be equipped with any make or type of tire, *Provided*, That the tire is a proper fit on the rim of the wheel; *And provided*, That the tire rating of the Airplane Tire Committee of the Tire and Rim Association is not exceeded.

(g) Each unit of a certificated model of main landing gear wheel shall bear the following additional identification data as prescribed in § 15.5 (c) (5):

The maximum static load for which certificated.

(h) A request for certification of a type or model or series of models of main landing gear wheels shall be supported by the following additional data as prescribed in § 15.6 (a) (3):

(1) A report of the static tests prescribed in § 15.11 (c). The report shall contain complete details of the tests, including records of wheel deflections and photographs of the test set-ups. The report shall be signed by the person making the tests, and shall be certified to unless the tests were witnessed by an inspector of the Administrator, in which

case such inspector also will sign the report as a witness.

[CAR, May 31, 1938, as amended by Amdt. 19, 4 F. R. 3391]

§ 15.12 *Brakes—(a) Testing of brakes for certification.* (1) A wheel-brake combination shall demonstrate satisfactory performance during 100 tests simulating the stopping of an airplane at an average deceleration of at least 10 feet per second per second, from a speed chosen by the applicant. The kinetic energy absorbed per stop shall be computed and the wheel-brake combination shall be certificated for a kinetic energy absorption not in excess of the amount so determined.

(2) To be eligible for use on airplanes certificated in accordance with the transport category requirements of Part 4a of this subchapter, a wheel-brake combination shall further demonstrate satisfactory performance during three tests identical with those specified in subparagraph (1) of this paragraph except that the speed shall be increased to obtain a kinetic energy absorption 125% of that determined under that subparagraph.

(b) *Adaptation of brakes to airplanes; transport category.* (1) An airplane certificated in accordance with the transport category requirements of Part 4a of this subchapter shall make use of wheel-brake combinations for which the summation of the kinetic energy ratings of the brakes used in the main landing gear is at least equal to:

$$K.E. = .0334 W V_s^2$$

where:

$K.E.$ = kinetic energy in foot-pounds.

W = the maximum landing weight of the airplane.

V_s = the power-off stalling speed of the airplane in miles per hour at sea level in standard air at maximum landing weight.

(2) The wheel-brake combinations used in such airplane shall have been tested, in determining the kinetic energy absorption under § 15.12 (a) from a speed lying between 80% and 100% of V_s .

(c) *Design.* Brakes shall be free from any undue tendency to lock or jam, and shall be suitably shielded from water, mud, and oil.

(d) *Static torque.* The maximum available static torque in reverse shall be at least 40% of the forward static torque when both are measured at the same applied pedal force.

(e) *Adjustment.* When necessary to insure satisfactory performance, the brake mechanism shall be equipped with suitable adjustment devices to compensate for disc or lining wear, heat, and other normal service effects.

(f) *Strength.* The brake and all of its attachments to the wheel shall be designed with an ultimate strength sufficient to withstand a torque which is 1.6 WR/B where R is the rolling radius of the tire and B is the number of brakes. A static test of the brake and wheel shall demonstrate that the assembly is capable of withstanding a torque which is 80% of the above without yielding to the point of impairing service operation.

(g) *Test log.* A log of the test runs shall be submitted together with other

calculations which are necessary to indicate compliance with the brake regulations in paragraphs (a) to (f) of this section.

(h) *Identification data.* Each certificated brake shall bear the following identification as prescribed in § 15.5 (c) (5):

The foot-pounds of kinetic energy for which it is approved.

[Amdt. 15-2, 7 F. R. 3585]

§ 15.13 *Seaplane floats.* (a) Main seaplane floats will be certificated for a maximum gross weight of airplane which will be determined in accordance with the applicable requirements prescribed in Part 4a of this subchapter.

(1) Certification of a float does not include certification of the structure attaching it to the aircraft. Such structure is classified in accordance with § 15.3 (c) (2).

(2) The installation of floats on aircraft shall be in accordance with the provisions of Part 4a of this subchapter.

(b) Each unit of a certificated model of main seaplane float shall bear the following additional identification data as prescribed in § 15.5 (c) (5):

(1) The maximum gross weight of aircraft for which certificated.

(2) The number of floats per aircraft.

(c) A request for certification of a type or model or series of models of main seaplane floats shall be supported by the following additional data as prescribed in § 15.6 (a) (3):

(1) The technical data required to prove compliance with the applicable structural and detail design requirements prescribed in Part 4a of this subchapter.

§ 15.14 *Skis.* (a) Skis, including ski pedestals, will be certificated for a maximum static load which will be determined from the strength of the ski.

(1) Certification of a ski and its pedestal does not include certification of any special structure attaching it to the aircraft. Such structure is classified in accordance with § 15.3 (c) (2).

(2) The installation of skis on aircraft shall be in accordance with the provisions of Part 4a of this subchapter.

(b) The strength of a ski, including the pedestal, shall be substantiated by a stress analysis or by static tests.

(c) A ski, including the pedestal, shall be designed to carry the following loads without failure when supported at the pedestal bearing sleeve:

(1) A load upward, distributed uniformly along the ski bottom and symmetrically with respect to the pedestal bearing sleeve in the fore-and-aft direction, the front end of the ski carrying no load if it is at a greater distance from the bearing sleeve than the rear end. The required load is equal to—

$$P \times n \times 1.5$$

where P is the maximum static load for which approval is requested, n is

$$2.80 + \frac{9000}{2P + 4000}$$

and is the applied landing load factor for the corresponding airplane, and 1.5 is the factor of safety.

No. 136—29

If the strength is substantiated by static test, the required test load is equal to—

$$P \times n \times 1.5 \times 1.15$$

where 1.15 is a strength test material factor.

(2) A load upward, applied to the ski bottom at a point directly under the pedestal bearing sleeve. The required load, or required test load, is equal to the load, or test load, specified in subparagraph (1) of this paragraph.

(3) A side load distributed uniformly along the edge of the ski bottom and symmetrically with respect to the pedestal bearing sleeve in the fore-and-aft direction, the front end of the ski carrying no load if it is at a greater distance from the bearing sleeve than the rear end. The required load, or required test load, is equal to 35 percent of the load, or test load, specified in subparagraph (1) of this paragraph. When the height of the aircraft axle from the ground with the ski installed is greater than the moment arm given in Figure 15-1 for the static load for which approval is requested, such side load may be reduced by the ratio of the moment arm given in Figure 15-1 to the height of the axle from the ground with the ski installed.

(4) A side load applied to the edge of the ski bottom at a distance forward of the axle equal to three times the pedestal height, except that if the pedestal height is less than the moment arm given in Figure 15-1 for the static load for which approval is requested, then the distance shall be three times the moment arm given in Figure 15-1. This side load shall be one-third the side load specified in subparagraph (3) of this paragraph.

(d) Each unit of a certificated model ski shall bear the following additional identification data as prescribed in § 15.5 (c) (5):

(1) The maximum static load for which certificated.

(e) A request for certification of a type or model or series of models of skis shall be supported by the following additional data as prescribed in § 15.6 (a) (3):

(1) A stress analysis of the ski and pedestal showing compliance with paragraph (c) of this section, if the strength of the ski and pedestal has been substantiated by a stress analysis. Such analysis shall be signed by the responsible engineer.

(2) A report of the static tests showing compliance with paragraph (c) of this section, if the strength of the ski and pedestal has been substantiated by static tests. The report shall contain complete load computations, complete details of the tests, and photographs of the test setups. The report shall be signed by the person making the tests and shall be certified to unless the tests were witnessed by an inspector of the Administrator, in which case such inspector also will sign the report as a witness.

[CAR, May 31, 1938, as amended by Amdt. 19, 4 F. R. 3391]

NAVIGATION APPLIANCES

§ 15.20 *Position lights.*—(a) *General provisions.* Position lights prescribed in Part 4a of this subchapter, in order to be certificated, shall be so constructed and capable of being so mounted as to comply with the regulations hereinafter prescribed.

(1) A request for certification and such supporting data as may be prescribed in this section shall be accompanied by a complete set of lights described in the data. Such data shall include a copy of the instructions for the mounting of the lights in aircraft as furnished by the light manufacturer to purchasers.

(2) As the forward (right and left) lights are complementary they will be certificated as a unit. The rear (tail) light will be certificated as a separate unit.

(3) Forward lights are classified as follows:

- (i) Standard forward position lights.
- (ii) Air carrier forward position lights.
- (iii) Auxiliary position lights.

(b) *Light distribution requirements.* See CAM 15 for diagrams.

FIGURE 15-1.—SKI DESIGN MOMENT ARM.

(1) *Definitions.* Three dihedral angles hereinafter referred to as dihedral angle L, dihedral angle R, and dihedral angle A, are defined as follows: dihedral angle L is formed by the intersection of two vertical planes, one passing through the forward axis of the light unit, as defined in the mounting instructions, and the other at an angle of 110 degrees to the first, measured to the left when looking away from the unit; dihedral angle R is formed by the intersection of two vertical planes, one passing through the forward axis of the light unit, as defined in the mounting instructions, and the other at an angle of 110 degrees to the first, measured to the right when looking away from the unit; and dihedral angle A (aft) is formed by the intersection of two vertical planes making dihedral angles of 70 degrees to the left and 70 degrees to the right, respectively, of a vertical plane passing through the rear axis of the light unit, as defined in the mounting instructions. Each dihedral angle shall be understood to include the bounding planes as well as the space between the planes.

(2) *Standard forward position lights.* Each standard forward position light shall have an intensity of not less than three candles in all directions in dihedral angle L for the left light and in dihedral angle R for the right light. Within these dihedral angles, respectively, the intensity in all directions shall equal or exceed the minimum values given in Table I according to the angle between the direction of measurement and the forward axis of the unit.

TABLE I—MINIMUM PERMISSIBLE INTENSITIES IN ANY PLANE THROUGH THE FORWARD AXIS OF THE UNIT

At angles from forward axis not exceeding:	Intensity
60 degrees-----	4 candles
30 degrees-----	8 candles

In all directions in dihedral angle R for the right light and in dihedral angle L for the left light, tolerance of 10 degrees will be allowed in which the intensity of these lights shall be reduced to not over two candles. In these same directions a further tolerance of an additional 10 degrees will be allowed in which the intensity shall be reduced to not more than 0.5 candle. In all directions in dihedral angle A a tolerance of 10 degrees will be allowed in which the intensity of these lights shall be reduced to a maximum intensity of 0.5 candle. In all directions outside the specified dihedral angle and the allowed tolerance angles for each unit, the stray light intensity shall not exceed 0.5 candle.

(3) *Air carrier forward position lights.* Each air carrier forward position light shall have an intensity of not less than three candles in all directions in dihedral angle L for the left light and in dihedral angle R for the right light. Within these dihedral angles, respectively, the intensity in all directions shall equal or exceed the minimum values given in Table II according to the angle between the direction of measurement and the forward axis of the unit.

TABLE II—MINIMUM PERMISSIBLE INTENSITIES IN ANY PLANE THROUGH THE FORWARD AXIS OF THE UNIT

At angles from forward axis not exceeding:	Intensity
60 degrees-----	5 candles
30 degrees-----	10 candles
20 degrees-----	20 candles
15 degrees-----	30 candles
10 degrees-----	35 candles
5 degrees-----	40 candles

Within the same dihedral angles the intensities in the horizontal plane shall equal or exceed the minimum values given in Table III according to the angle between the direction of measurement and the forward axis of the unit.

TABLE III—MINIMUM PERMISSIBLE INTENSITIES IN THE HORIZONTAL PLANE THROUGH THE FORWARD AXIS OF THE UNIT

At angles from forward axis not exceeding:	Intensity
80 degrees-----	5 candles
40 degrees-----	10 candles
30 degrees-----	20 candles
20 degrees-----	30 candles
10 degrees-----	40 candles

In all directions in dihedral angle R for the right light and in dihedral angle L for the left light, a tolerance of 10 degrees will be allowed in which the intensity of these lights shall be reduced to not over 10 candles. In these same directions a further tolerance of an additional 10 degrees will be allowed in which the intensity shall be reduced to not more than 1 candle. In all directions in dihedral angle A a tolerance of 10 degrees will be allowed in which the intensity of these lights shall be reduced to not more than 1 candle. In all directions outside the specified dihedral angle and the allowed tolerance angles for each unit, the stray light intensity shall not exceed 1 candle.

(4) *Auxiliary forward position lights.* Each auxiliary forward position light shall have an intensity of not less than 20 candles in all directions not exceeding 30 degrees of the forward axis of the unit, measured in dihedral angle L for the left unit and in dihedral angle R for the right unit. Within the aforementioned angles the intensity in all directions shall equal or exceed the minimum values given in Table IV according to the angle between the direction of the measurement and the forward axis of the unit.

TABLE IV—MINIMUM PERMISSIBLE INTENSITIES IN ANY PLANE THROUGH THE FORWARD AXIS OF THE UNIT

At angles from forward axis not exceeding:	Intensity
20 degrees-----	30 candles
10 degrees-----	40 candles

In all directions in dihedral angle R for the right light and in dihedral angle L for the left light, a tolerance of 10 degrees will be allowed in which the intensity of these lights shall be reduced to not over 8 candles. In these same directions a further tolerance of an additional 10 degrees will be allowed in which the intensity shall be reduced to not more than 0.5 candle. In all directions in dihedral angle A the maximum intensity shall be less than 0.5 candle. In all directions outside the

specified dihedral angle and the allowed tolerance angles for each unit, the stray light intensity shall not exceed 0.5 candle.

(5) *Non-air carrier airplane rear position lights.* Each rear position light shall have an intensity of not less than 4 candles in dihedral angle A. Within this dihedral angle the intensity in all directions not exceeding 70 degrees from the rear axis of the unit shall be not less than 8 candles. In all directions in dihedral angle L and in dihedral angle R, a tolerance of 20 degrees will be allowed in which the intensity of this light must be reduced to a maximum stray light intensity of 1 candle. In all directions outside the specified dihedral angle and the allowed tolerance angles, the stray light intensity shall not exceed 1 candle.

(6) *Air carrier airplane rear position lights.* Air carrier airplane rear position lights shall emit an alternate aviation red and aviation white flash repeated at a frequency of 40 cycles a minute, each cycle having characteristics prescribed by the Administrator. Both white and red lights shall be fitted with 32-candlepower lamps. The red and white units of the light may be separate units spaced as closely as possible. Each color of light shall be completely visible in dihedral angle A. If separate red and white units are used, certificated white tail lights may be converted into such units as follows: (i) The candlepower of the lamps shall conform to the requirements of this section, (ii) the clear cover glass for the intended red unit shall be replaced by a red cover glass of the same design. No photometric tests of such converted lights will be considered necessary when the above changes are made. If the light is of a new type, it shall emit light in all directions in dihedral angle A, as specified in subparagraph (5) of this paragraph.

(c) *Color.* All left forward position lights shall be aviation red, all right forward position lights shall be aviation green, and all rear position lights for non-air carrier aircraft shall be aviation white. These colors are defined as follows:

(1) Aviation red is a color having the following ICI chromaticity coordinates:

$$y \text{ is not greater than } 0.335 \text{ and} \\ z \text{ is not greater than } 0.002$$

(2) Aviation green is a color having the following ICI chromaticity coordinates:

$$x \text{ is not greater than } 0.440 - 0.320y \\ x \text{ is not greater than } y - 0.170 \text{ and} \\ y \text{ is not less than } 0.390 - 0.170z$$

(3) Aviation white is a color having the following ICI chromaticity coordinates:

$$z \text{ is not less than } 0.350 \\ x \text{ is not greater than } 0.540 \\ y - y_0 \text{ is not numerically greater than } 0.01 \\ y_0 \text{ being the } y \text{ coordinate of the Planckian radiator for which } x_0 = x.$$

(d) *Light covers.* The lamp and reflectors shall be protected by a cover which shall be of noncombustible material and so constructed that it will not change color or shape, or cloud, or suffer any considerable loss of transmission in

normal use. The coloring of those portions which are intended to transmit light shall be completely diffused through the material.

[Amdt. 20, 4 F. R. 3453, as amended by Amdt. 15-1, 7 F. R. 1710, and 11 F. R. 1267]

§ 15.21 *Landing flares.* (a) Landing flares prescribed in Part 4a of this subchapter, in order to be certificated, shall be so constructed and capable of being so mounted as to comply with the regulations prescribed in this part.

(1) The installation of landing flares in aircraft shall be in accordance with the provisions of Part 4a of this subchapter, and the flare manufacturer's mounting instructions.

(b) Landing flares will be certificated with respect to their light duration and light intensity. They are grouped in three classifications as follows:

(1) Class 1 flares.

(2) Class 2 flares.

(3) Class 3 flares.

(c) Class 1 flares shall have a light duration of at least 3 minutes, a light intensity of at least 200,000 candlepower and a rate of descent not greater than 550 feet per minute.

(d) Class 2 flares shall have a light duration of at least 1½ minutes, a light intensity of at least 110,000 candlepower, and a rate of descent not greater than 550 feet per minute.

(e) Class 3 flares shall have a light duration of at least 1 minute, a light intensity of at least 70,000 candlepower, and a rate of descent not greater than 550 feet per minute.

(f) Each unit of a certificated model landing flare shall bear the following additional identification data as prescribed in § 15.5 (c) (5):

(1) The class for which certificated.

(g) Upon satisfactory completion of the examination of the technical data submitted to the Administrator, five flares of each model described in the data, an airplane arranged for the complete installation of flares of each model, and operating personnel shall be made available for functional tests of the flares. These tests may be made at any location desired by the manufacturer.

(1) In the event that there is one failure out of the five flares subjected to functional tests, five additional flares shall be subjected to functional tests.

(2) Failure of two or more flares out of 10 dropped shall be sufficient grounds for denial of certification by the Administrator. Certification will be made only if all five original flares function satisfactorily or, in the event of one failure in the original five, if the second five function satisfactorily.

SAFETY EQUIPMENT

§ 15.30 *Safety belts.* (a) Safety belts will be certificated for general aircraft use or for glider use dependent upon the strength of the belt.

(1) Certification of a safety belt does not include certification of its anchorages to the aircraft.

(2) The installation of safety belts in certificated aircraft shall be in accordance with the pertinent provisions of Part 4a of this subchapter.

(b) Safety belts shall be so designed as to be easily adjustable. Each belt shall be equipped with a quick-release mechanism so designed that it cannot be released inadvertently. The width of a certificated safety belt shall be at least 2 inches.

(c) The strength of a safety belt shall be determined by static test.

(d) Safety belts for general aircraft use will be certificated for one person or two adjacent persons dependent upon the strength of the belt.

(1) A safety belt for one person shall be capable of withstanding a load of 1,000 pounds applied in the same manner as a person's weight would be applied in a crash. The quick-release mechanism shall be capable of withstanding this load without undue distortion, so that when the load is relieved to 400 pounds the mechanism shall be capable of being operated by hand.

(2) A safety belt for two persons shall be capable of withstanding a load of 2,000 pounds applied in the same manner as the weight of two persons would be applied in a crash. The quick-release mechanism shall be capable of withstanding this load without undue distortion, and when the load is relieved to 800 pounds the mechanism shall be capable of being operated by hand.

(e) Safety belts for glider use only will be certificated as such.

(1) A safety belt for glider use shall be capable of withstanding a load of 850 pounds applied in the same manner as a person's weight would be applied in a crash. The quick-release mechanism shall be capable of withstanding this load without undue distortion, and when the load is relieved to 400 pounds the mechanism shall be capable of being operated by hand.

(f) Each unit of a certificated model safety belt shall bear the following additional identification data as prescribed in § 15.5 (c) (5):

(1) Whether for one person, two persons, or for glider use only.

(g) A request for certification of a type or model or series of models of safety belts shall be supported by the following additional data as prescribed in § 15.6 (a) (3):

(1) A report of the static tests showing compliance with paragraph (c) (1), (c) (2), and (e) (1) as the case may be. The report shall contain complete details of the tests, including the hand operation of the quick-release mechanism under relieved load, and shall contain photographs of the test setup. The report shall be signed by the person making the tests and shall be certified to unless the tests were witnessed by an inspector of the Administrator, in which case such inspector also will sign the report as a witness.

[CAR, May 31, 1938, as amended by Amdt. 19, 4 F. R. 3391]

§ 15.31 *Parachutes.* (a) Parachutes prescribed by the regulations in this subchapter in order to be certificated, shall be so constructed as to comply with the following regulations.

(1) All materials used shall be equivalent to or better than those specified by

the United States Army or Navy for parachutes, or shall be proved satisfactory to the Administrator by technical data and practical tests.

(2) The follow-through between parachute and rider shall be so engineered that all parts or fittings carrying a shock load are stronger than the combined strength of the suspension lines to which they are attached.

(3) All metal parts shall be designed to carry their full rated load without yielding.

(4) The fabric used in the canopy construction shall be free from gums, starches, and other foreign material. It shall also be free from avoidable imperfections in manufacture and from defects or blemishes affecting its strength or durability and shall have been finished without application of excessive heat. The surface of the fabric shall be smooth.

(5) Suspension lines shall be continuous, without splices, from connector link to connector link and shall contain no knots between these points.

(6) Before securing the suspension lines to the skirt, each line shall be put under 40 pounds tension and marked to show the point of attachment. The fabric shall be pulled out but not stretched.

(7) The machine sewing shall be made with a shuttle or plain stitch. All zigzag sewing shall be done on a 2-stitch sewing machine.

(8) The rip cord, including joints between the handle and the release, shall be designed to withstand a load of 300 pounds.

(9) The harness shall be so constructed that the rider can release himself and drop clear in case of a water landing, but a quick-attachable or quick-releasing device between the harness and the parachute is not mandatory.

(10) Each parachute outfit shall be provided with a suitable place for keeping a record card containing spaces for recording dates of repacking, repairs, by whom made, and space for the manufacturer's recommendations as to repacking.

(b) Deviations from paragraph (a) (5), (6), (7) of this section shall be such as are acceptable to the United States Army or Navy, or shall be proved satisfactory to the Administrator by technical data and practical tests.

(c) A request for certification of a type or model or series of models of parachutes shall be supported by the following additional data as prescribed in § 15.6 (a) (3):

(1) Data showing compliance with subparagraphs (a) (1)-(a) (10) of this section. These data may be references to drawings submitted if the drawings clearly show compliance with the regulations in this part.

(2) Data substantiating any deviations in accordance with paragraph (b) of this section.

(3) A detailed list of the material and strength specifications of all component parts of the parachutes described in the drawings. The list shall also specify the manufacturing practices employed in the assembly operations and shall satisfy the Administrator that all parts are properly pull-tested before assembly.

(d) Upon satisfactory completion of the examination of the technical data submitted to the Administrator of Civil Aeronautics, parachutes of each model described in the data, together with an airplane and operating personnel, shall be made available for the following tests of the parachutes. These tests may be made at any location desired by the manufacturer.

(1) *Functional test (normal pack).* Twelve drops from an airplane with a 170-pound dummy man, from an altitude of not more than 500 feet. The indicated air speed of the airplane at the time of release shall be 70 miles per hour. No twists shall purposely be packed in the suspension lines. The parachute must be fully open within 3 seconds from time of release.

(2) *Functional test (twisted lines).* Five drops from an airplane with a 170-pound dummy man, from an altitude of not more than 500 feet. The indicated air speed of the airplane at the time of release shall be 70 miles per hour. Three twists shall purposely be packed in the suspension lines near the skirt. The parachute must be fully open within 4 seconds from time of release.

(3) *Strength test.* Three drops with the same parachute with a 600-pound lead weight, from an airplane at an altitude of not more than 500 feet. The indicated air speed of the airplane at the time of release shall be 100 miles per hour. No twists shall purposely be packed in the suspension lines. The weight shall be attached to the harness. No external shock absorbers or material which may act as such shall be permitted. The parachute shall show no failure of any material.

(4) *Live drop tests.* Two live drops from an airplane with a 170-pound man, from an altitude of 2,000 feet on a comparatively still day. An additional certificated auxiliary parachute shall be carried. The rider must suffer no discomfort from opening shock and must be able to disengage himself from the harness after landing.

(5) *Rate of descent test.* One drop from an airplane with a 170-pound dummy man, from an altitude of 2,500 feet. The rate of descent shall not exceed 21 feet per second. The descent shall be timed from the time of full opening to the time of ground impact. The distance descended shall be assumed at 2,250 feet and the rate of descent shall be this distance divided by the time in seconds.

(6) *Test performance requirement.* One hundred percent performance shall be required in the tests specified in subparagraphs (1) to (5) of this paragraph, except in the case of an auxiliary parachute. (See paragraph (f) of this section.)

(e) The tests specified in paragraph (d) of this section will not be required for parachutes previously approved by the United States Army Air Corps or by the Bureau of Aeronautics, Navy Department. In lieu of these tests, there shall be included in the supporting data submitted with a request for certification of such a parachute the following data:

(1) A copy of the official report describing the drop tests and static tests which formed the basis of the Army or Navy approval, signed by the Army or Navy representatives who witnessed the tests.

(2) A statement by an authorized representative of the Army or Navy to the effect that the parachute is approved and accepted by the Army or Navy as the case may be.

(f) A parachute to be certificated for use as an auxiliary parachute in combination with a certificated parachute need not comply with the rate of descent specified in subparagraph (d) (5) of this section, but shall have a rate of descent not exceeding 25 feet per second and shall comply with all of the other regulations prescribed in this part.

(1) The technical data submitted in connection with an auxiliary parachute and the tests made to obtain its certification shall satisfactorily account for the combination of parachutes and not the auxiliary parachute alone.

(2) Each unit of a certificated model auxiliary parachute shall bear the following additional identification data as prescribed in § 15.5 (c) (5): "Auxiliary only."

CONTROL AND STRUCTURAL UNITS

§ 15.40 *General.* (a) Certain types of special control units and structural units, such as those listed in § 15.3 (d), so designed that they can be used in any type or model of aircraft without change or with only minor changes which in no way affect the operation or strength of the units, will be certificated: *Provided*, That they comply with the regulations applicable to them prescribed in Part 4a of this subchapter.

(1) The installation of such special units in aircraft shall be in accordance with the pertinent provisions of Part 4a of this subchapter and the instructions of the manufacturers of the units.

(b) Before requesting certification of a type or model, or series of models, of a special control unit or structural unit, the manufacturer shall apply to the Administrator for a ruling as to the additional data to be submitted in accordance with § 15.6 (a) (3) to show compliance with the regulations applicable to the unit in question prescribed in Part 4a of this subchapter. This application shall be accompanied by a description of the unit and a drawing, or drawings, sufficient to enable the Administrator to make a ruling particularly applicable to the unit in question.

EQUIPMENT ITEMS ADAPTED TO SPECIFIC AIRCRAFT MODELS

§ 15.50 *Equipment items adapted to only one aircraft model.* (a) Certain items of equipment, such as those listed in § 15.3 (e), so designed that they can be used only in one aircraft model will be specially approved as integral parts of the aircraft in which they are installed: *Provided*, That they comply with the regulations applicable to them prescribed in Part 4a of this subchapter.

(b) A request for approval of such an item of equipment shall be supported by

the following additional data as prescribed in § 15.6 (a) (3):

(1) Data showing compliance with the regulations applicable to the item in question prescribed in Part 4a of this subchapter.

(2) In lieu of the data specified in subparagraph (1) of this paragraph, data in accordance with a special ruling made by the Administrator and obtained by the procedure prescribed in § 15.40 (b).

(c) The request for approval of such an item of equipment together with its supporting data shall be included with the approval request and supporting data for the aircraft model in which the item is installed.

§ 15.51 *Equipment items adapted to any aircraft model by means of detail design changes.* (a) Certain items of equipment, such as those listed in § 15.3 (e), of such a nature that by means of detail design changes they can be used in any aircraft model, will be specially approved as integral parts of the aircraft in which they are installed: *Provided*, That they comply with the regulations applicable to them prescribed in Part 4a of this subchapter.

(b) If the manufacturer so desires, such an item of equipment may be considered as a series of items, each so designed that it can be used only in one aircraft model. Approval in such a case will be handled as prescribed in § 15.50.

(c) If the procedure prescribed in paragraph (b) of this section is too cumbersome to suit a particular item, the item will be considered in two parts as follows:

- (1) The unchanged basic structure.
- (2) The variable structure.

(d) If the basic structure is deemed satisfactory by the Administrator, only the variable structure need be considered in connection with the certification of each aircraft model in which the item is installed.

(e) A request for examination of the basic structure of such an item of equipment shall be supported by the following additional data as prescribed in § 15.6 (a) (3):

(1) Data showing compliance with the regulations applicable to the item in question prescribed in Part 4a of this subchapter.

(2) In lieu of the data specified in subparagraph (1) of this paragraph, data in accordance with a special ruling made by the Administrator and obtained by the procedure prescribed in § 15.40 (b).

(f) A request for approval of a complete item of equipment in this classification shall be supported by the following data:

(1) Complete references to the data pertaining to the basic structure previously deemed satisfactory by the Administrator.

(2) Data as prescribed in paragraph (e) (1) or (2) of this section, but pertaining only to the variable structure.

(3) Any additional data which may have been prescribed by the Administrator at the time of his examination of the basic structure.

PART 16—AIRCRAFT RADIO EQUIPMENT
AIRWORTHINESS¹

GENERAL

- Sec.
16.10 Scope.
16.11 Deviation.
16.12 Waiver.

TECHNICAL DATA

- 16.20 General.
16.21 Drawings.
16.22 Drawing list.
16.23 Parts list.

CHARACTERISTICS

- 16.30 Design and tests.
16.30-1 Cross-pointer indicators (CAA rules which apply to § 16.30).

INSPECTION AND TESTS

- 16.40 General.
16.41 Facilities.
16.42 Report.

REGULATIONS

- 16.50 Identification.
16.51 Modification.
16.52 List changes.

AUTHORITY: §§ 16.10 to 16.52 issued under sec. 205 (a), 52 Stat. 984; 49 U. S. C. 425 (a). Interpret or apply sec. 601, 52 Stat. 1007; 49 U. S. C. 551.

SOURCE: §§ 16.10 to 16.52 contained in Amendment 85, 5 F. R. 5144, except as noted following section affected.

GENERAL

§ 16.10 *Scope.* Aircraft radio equipment required by this chapter to be type certificated and installed in certificated aircraft is eligible for a type certificate upon meeting the requirements herein-after prescribed.

§ 16.11 *Deviation.* New types, or new types of construction, of aircraft radio equipment which make the tests prescribed by the regulations in this part inapplicable may be subjected to such other tests as the Administrator may deem necessary to insure safe operation.

§ 16.12 *Waiver.* The tests prescribed herein may be waived whenever, in the opinion of the Administrator, a particular part of aircraft radio equipment is so designed or constructed that such tests are not necessary to insure airworthiness.

TECHNICAL DATA

§ 16.20 *General.* To be eligible for a type certificate for aircraft radio equipment, an applicant must submit the technical data described in §§ 16.21, 16.22, and 16.23.

§ 16.21 *Drawings.* One set of drawings in blueprint or equivalent form folded to approximately 9 by 12 inches containing the manufacturer's designation of the aircraft radio equipment and all details of design, construction, assembly, and materials used which are necessary for the reproduction of such aircraft radio equipment: *Provided*, That

¹ Application for type certification of aircraft radio equipment should be made as prescribed in Part 2 of this subchapter. The provisions of §§ 2.2 and 2.3 of this subchapter providing for a production certificate and the rules for the operation under such certificate shall not be applicable to the case of type certification of aircraft radio equipment.

adequate photographs may be substituted for such drawings if such photographs are suitably marked to indicate the details required in this section.

§ 16.22 *Drawing list.* A drawing list setting forth in numerical order or by other suitable classification, the title and number or date of each drawing submitted under § 16.21.

§ 16.23 *Parts list.* A list specifying each component part of the aircraft radio equipment submitted to the Administrator for certification. The list shall indicate the physical or circuit location of each item and the type or model designation assigned to such item by the manufacturer.

CHARACTERISTICS

§ 16.30 *Design and tests.* To be eligible for type certification, aircraft radio equipment must be so designed and constructed that it will satisfactorily perform the function or functions for which it is intended to be used in aircraft under all flight conditions which may be met in regular service and must:

- (a) Be free from hazard both in itself and in its method of operation;
- (b) Be constructed of suitable and dependable materials;
- (c) Satisfactorily pass a visual inspection of the construction, lay-out, and electrical arrangement of all components of the particular aircraft radio equipment and such electrical, humidity, temperature, pressure, vibration, drop, and other tests as the Administrator may prescribe.

[Amdt. 85, 5 F. R. 5144]

§ 16.30-1 *Cross-pointer indicators (CAA rules which apply to § 16.30).* (a) At the time the type I-101 Cross-Pointer Indicator was type certificated for use in conjunction with airborne ILS and VHF navigational equipment, it was recognized that the Indicator did not have incorporated in it certain warning features considered to be important in the interest of safety. However, as there was no indicator being manufactured at that time which did incorporate those features, the I-101 Indicator was type certificated for air carrier use subject to certain limitations.

(b) There is now in quantity production at least one type of ILS cross-pointer indicator which incorporates the so-called "flag alarm" indicator. There may be other equally satisfactory indicators under development.

(c) In view of the availability of the improved type indicator, it appears to be in the best interest of safety to discontinue use of the type I-101 Indicator as soon as practicable.

(d) Effective immediately, no cross-pointer indicator shall be type certificated for installation in air carrier aircraft unless a flag alarm or other satisfactory alarm system has been incorporated in the indicator. Effective December 31, 1948, the type certificate is canceled for the type I-101 Cross-Pointer Indicator, and after that date such Indicator shall not be used in air carrier operations.

[Supp. 1, 13 F. R. 4251. Correction noted at 14 F. R. 37]

INSPECTIONS AND TESTS

§ 16.40 *General.* The prescribed inspections and tests shall be conducted by the applicant under the supervision of representatives of the Administrator at a designated time and place and in such manner and under such conditions as they may deem necessary.

§ 16.41 *Facilities.* All engineering, technical, and physical facilities which may be necessary for the conduct of all of the prescribed inspections and tests shall be provided by the applicant.

§ 16.42 *Report.* The applicant shall submit in duplicate a written report of the results of the prescribed inspections and tests which shall be in such detail as the Administrator may require.

REGULATIONS

§ 16.50 *Identification.* Type certificated aircraft radio equipment shall be plainly and suitably marked with at least the following information:

- (a) Name and address of manufacturer;
- (b) Manufacturer's type or model designation;
- (c) Weight to the nearest pound and fraction thereof;
- (d) Serial number or date of manufacture;
- (e) Type certificate number.

§ 16.51 *Modification.* No change shall be made in the approved specifications under which type certificated aircraft radio equipment is manufactured prior to the approval of such change by the Administrator.

§ 16.52 *List changes.* The holder of a type certificate for aircraft radio equipment shall keep all lists furnished the Administrator current by submitting revised lists containing all changes made subsequent to original certification.

PART 18—MAINTENANCE, REPAIR, AND ALTERATION OF CERTIFICATED AIRCRAFT AND OF AIRCRAFT ENGINES, PROPELLERS, AND INSTRUMENTS¹

GENERAL

- Sec.
18.1 Definitions.

MAINTENANCE, REPAIRS, AND ALTERATIONS

- 18.5 Routine maintenance.
18.6 Repairs.
18.7 Alterations.

RULES AND PROCEDURES FOR MAINTENANCE, REPAIRS, AND ALTERATIONS

- 18.10 Agencies authorized to perform maintenance, repair, and alteration operations.
18.11 Provision for approval of major repairs and major alterations.
18.12 Flight tests.

¹ Civil Aeronautics Manual 18, which may be secured from the Correspondence Section, Civil Aeronautics Administration, Washington 25, D. C., describes in detail the operations which the Administrator of Civil Aeronautics considers to be routine maintenance, minor and major repairs, and minor and major alterations. It sets forth in detail repair methods, techniques, and practices which the Administrator has found acceptable in the execution of repairs in accordance with the regulations in this part. It also describes forms, scope of technical data, and records prescribed by the Administrator in accordance with this part.

RECORDING OF REPAIRS AND ALTERATIONS

Sec.

- 18.15 Minor repair and minor alteration logbook entries.
- 18.16 Major repair and major alteration records.
- 18.17 Provision for air carrier records.

DESIGN, TECHNIQUES, AND MATERIALS

- 18.20 Design, techniques, and materials.

AUTHORITY: §§ 18.1 to 18.20 issued under sec. 205 (a), 52 Stat. 984; 49 U. S. C. 425 (a). Interpret or apply secs. 601, 605, 52 Stat. 1007, 1010; 49 U. S. C. 551, 554.

SOURCE: §§ 18.1 to 18.20 contained in Amendment 105, Civil Air Regulations, 6 F. R. 1811.

GENERAL

§ 18.1 *Definitions.* As used in this part: (a) "Aircraft engine" means an aircraft engine approved by the Administrator.

(b) "Propeller" means a propeller approved by the Administrator.

(c) "Instrument" means an instrument installed, for other than purely experimental purposes, in a certificated aircraft.

(d) "Manufacturer" means: (1) the holder of the type certificate, or approval by the Administrator, for an aircraft, aircraft engine, or propeller, or of the current rights, under a licensing arrangement, to the benefits of such type certificate or approval, or (2) the manufacturer of a part or accessory of a certificated aircraft, or (3) the manufacturer of an instrument which is installed in a certificated aircraft: *Provided*, That such manufacturer shall have in his employ a properly certificated mechanic in direct charge of maintenance, repair, or alteration operations.

MAINTENANCE, REPAIRS, AND ALTERATIONS

§ 18.5 *Routine maintenance.* Routine maintenance is defined as simple or minor preservation operations including but not limited to the adjustment of rigging and clearances, and the replacement of small standard parts not involving complex assembly operations.

§ 18.6 *Repairs.* A repair is any operation other than routine maintenance which is required to restore an aircraft, aircraft engine, propeller, or instrument to a condition for safe operation, including the mending or replacement of damaged or deteriorated parts.

(a) *Minor repairs.* Minor repairs are elementary repair operations executed in accordance with standard practices and not within the definition of major repairs.

(b) *Major repairs.* Major repairs are complex repair operations of vital importance to the airworthiness of an aircraft, including but not limited to:

(1) Straightening, splicing, welding and similar operations when the strength of important structural members might be appreciably affected thereby.

(2) Operations requiring complicated or unconventional techniques or equipment.

§ 18.7 *Alterations.* An alteration is any appreciable change in the design of an aircraft, aircraft engine, propeller, or instrument.

(a) *Minor alteration.* A minor alteration is:

(1) An alteration having no appreciable effect on the weight, balance, structural strength, power-plant operation, flight characteristics, or other characteristics affecting the airworthiness of an aircraft; or

(2) An alteration for which specific plans and instructions have been approved by the Administrator and which can be executed by means of elementary operations.

(b) *Major alterations.* Major alterations are all alterations not within the definition of minor alterations.

RULES AND PROCEDURES FOR MAINTENANCE, REPAIRS, AND ALTERATIONS

§ 18.10 *Agencies authorized to perform maintenance, repair, and alteration operations.* Maintenance, repair, and alteration operations shall be performed only by: (a) A certificated mechanic having the proper rating or a person working under the direct supervision of such mechanic; or (b) a certificated repair station having the proper rating; or (c) the manufacturer of the aircraft or part of the aircraft to be repaired: *Provided*, That all instrument repairs and alterations and propeller major repairs and major alterations shall be performed only by a certificated repair station having the proper rating or by the instrument or propeller manufacturer.

§ 18.11 *Provision for approval of major repairs and major alterations.* No aircraft, aircraft engine, or propeller which has undergone any major repair or major alteration shall be returned to service until examined, inspected, and approved by a duly authorized representative for the Administrator unless such repair or alteration has been executed in accordance with a manual or specification approved by the Administrator,² and performed by a certificated repair station of the proper rating or by the manufacturer.

§ 18.12 *Flight tests.* When an aircraft or aircraft engine or propeller thereof has undergone a maintenance, minor repair, or minor alteration operation which may have changed its flight characteristics appreciably or substantially affected its operation in flight, or has undergone a major repair or major alteration, such aircraft shall, prior to carrying passengers, be test flown by a pilot having at least 200 solo hours and holding at least a private pilot certificate and appropriate rating for the aircraft to be test flown.

RECORDING OF REPAIRS AND ALTERATIONS

§ 18.15 *Minor repair and minor alteration logbook entries.* An adequate description of every minor repair or minor alteration of an aircraft, aircraft engine, or propeller shall be entered in the appropriate logbook over the signature and certificate number of the mechanic directly in charge of or performing such

² Such manual or specification may, for example, be issued by the manufacturer, a certificated repair station, or by the Administrator. All such manuals or specifications issued by parties other than the Administrator must be approved by him.

repair or alteration and in case a manufacturer or a certificated repair station makes said repair or alteration the appropriate logbook shall also be signed by an authorized official of such agency. The installation of an instrument in an aircraft shall be recorded in the aircraft logbook by the agency making the installation.

§ 18.16 *Major repair and major alteration records.* A repair agency performing a major repair or major alteration on an aircraft, aircraft engine, or propeller, shall execute such Repair and Alterations Forms as may be prescribed and furnished by the Administrator, and shall deliver a duplicate copy of any such Form to the owner of the aircraft and make proper entries on the appropriate page of the Aircraft Operation Record.

§ 18.17 *Provisions for air carrier records.* Logbook and aircraft operation record entries required in this part may be replaced, in the case of repairs or alterations to scheduled air carrier aircraft, by a suitable system of recording repairs, alterations, and signatures of responsible personnel.

DESIGN, TECHNIQUES, AND MATERIALS

§ 18.20 *Design, techniques, and materials.* Repairs shall be so executed, and materials of such strength and quality shall be used that the condition of the repaired aircraft, aircraft engine, propeller, or instrument shall be at least equivalent to its original or a properly altered condition in regard to aerodynamic and mechanical function, structural strength, and resistance to vibration and deterioration, and all other qualities affecting airworthiness. Alterations shall be so designed and executed that the altered aircraft, aircraft engine, propeller, or instrument will comply with the airworthiness requirements in effect when the particular model of the aircraft or part of the aircraft was originally certificated and, in addition, with particular provisions of the current airworthiness requirements rendered necessary for safe operation by the alteration.

SOURCE: §§ 20.1 to 20.82 contained in Amendment 20-0, Civil Air Regulations, 10 F. R. 5060, except as noted following sections affected.

CROSS REFERENCE: For regulations with respect to air-line transport pilot certificates and lighter-than-air pilot certificates, see Parts 21 and 22 of this subchapter.

STUDENT PILOT CERTIFICATE

§ 20.1 *Issuance.* A student pilot certificate will be issued by the Administrator or his authorized representative to an applicant who meets the applicable requirements.

[Amdt. 20-7, 12 F. R. 5008]

§ 20.2 *Age.* (a) Powered aircraft: 16 years.

(b) Gliders: 14 years.

If an applicant is less than 21 years of age at the time of making application, he shall submit with his application the written consent of either parent or legal or natural guardian.

§ 20.3 *Citizenship.* Applicant shall be a loyal citizen of the United States or of a friendly foreign government not under the domination of or associated with any government with which the United States is at war. (Wartime regulation to be revised when conditions permit.)

§ 20.4 *Education.* Applicant shall be able to read, write, speak, and understand the English language or an

appropriate operation limitation will be placed on the student pilot certificate.

§ 20.5 *Physical standards—(a) Powered aircraft.* Applicant shall meet the physical standards of the third class prescribed in Part 29 of this subchapter.

(b) *Glider.* Applicant shall have no known physical defect which renders him incompetent to pilot a glider, and shall so certify.

§ 20.6 *Aeronautical knowledge.* None.

PILOT CERTIFICATE AND RATINGS

§ 20.10 *Issuance.* A pilot certificate shall be issued to an applicant who meets the minimum requirements prescribed herein. A private or commercial pilot rating, aircraft category, class, and type ratings, instrument rating, flight instructor rating, and any other necessary special ratings for which the pilot has been found qualified shall be issued in connection with a pilot certificate.

[Amdt. 20-2, 14 F. R. 2192]

§ 20.11 *Graduates of certificated flying schools.* A graduate of a certificated flying school will be deemed to have met the aeronautical experience requirements of this part, if he presents an appropriate certificate of graduation within 60 days after graduation date.

§ 20.12 *Limited pilot certificate.* A citizen of a foreign government who holds a currently effective pilot certificate or license issued by his government, upon submitting to the Administrator reliable evidence showing his pilot time and aeronautical experience may be issued a Limited Pilot Certificate appropriate to his pilot time and aeronautical experience shown. The holder of such certificate shall be familiar with the air traffic rules and shall not transport passengers or cargo where a charge is made for such transportation. The certificate shall contain such limitations as the Administrator finds necessary for safety, including but not limited to those which may be required by reason of the pilot's inability to speak and understand the English language.

[Amdt. 20-2, 11 F. R. 3244]

PRIVATE PILOT RATING

§ 20.20 *Age.* (a) Powered aircraft: 17 years.

(b) Glider: 14 years.

§ 20.21 *Citizenship.* Applicant shall be a loyal citizen of the United States or of a friendly foreign government not under the domination of or associated with any government with which the United States is at war. (Wartime regulations to be revised when conditions permit.)

§ 20.22 *Education.* Applicant shall be able to read, write, speak, and understand the English language or an appropriate operation limitation will be placed on the pilot certificate.

§ 20.23 *Physical standards—(a) Powered aircraft.* Applicant shall meet the physical standards of the third class prescribed in Part 29 of this subchapter.

(b) *Glider.* Applicant shall have no known physical defect which renders him

incompetent to pilot a glider, and shall so certify.

§ 20.24 *Aeronautical knowledge.* Applicant for a powered aircraft or glider rating shall have passed the written examination prescribed in § 43.53 (a) of this subchapter within the preceding 24 calendar months.

[Amdt. 20-5, 12 F. R. 1417]

§ 20.25 *Aeronautical experience—(a) Powered aircraft.* An applicant for a pilot certificate with a private rating in powered aircraft shall meet the requirements of either subparagraphs (1) or (2), and (3) of this paragraph. If the applicant meets the requirements of subparagraph (2) but not subparagraph (1) of this paragraph, his certificate shall be appropriately endorsed by the Administrator.

(1) In spinnable aircraft he shall have at least 30 hours of solo flight time and at least 10 hours of dual instruction time given by a rated flight instructor.

(i) At least 2 hours of the dual instruction time shall have been after solo.

(ii) The dual instruction shall include instruction in the prevention of and recovery from power-on and power-off stalls entered from all normally anticipated flight attitudes.

(iii) If the applicant is the holder of a private or commercial pilot certificate with a glider rating, he may receive credit for not more than 15 hours of the required solo flight time for the flight time had in gliders; or

(2) In nonspinnable aircraft he shall have at least 20 hours of solo flight time and at least 7 hours of dual instruction time given by a rated flight instructor.

(i) At least 2 hours of the dual instruction time shall have been after solo.

(ii) If the applicant is the holder of a private or commercial pilot certificate with glider rating, he may receive credit for not more than 10 hours of the required solo flight time for the flight time had in gliders; and

(3) In either spinnable or nonspinnable aircraft he shall have at least 3 hours of solo cross-country flight time which shall include at least one solo flight to a point not less than 50 miles distant from the point of departure with at least 2 full-stop landings at different points along the course.

(b) *Glider.* Applicant for a glider rating shall have had at least 100 glider flights or 10 hours of glider flight time including at least 50 glider flights. At least 25 flights must have included a 360° turn.

[Amdt. 20-8, 12 F. R. 6852, and Amdt. 20-3, 14 F. R. 3326]

NOTE: § 20.25 (a) was amended by Amdt. 20-3, effective Aug. 15, 1949.

§ 20.26 *Aeronautical skill.* Applicant shall competently perform the following maneuvers:

(a) *Powered aircraft.* (1) A series of 3 landings from an altitude not to exceed 1,000 feet with engine throttled and a 180° change in direction, the aircraft touching the ground in normal landing attitude beyond and within 300 feet of a designated line or point. At least one

landing must be accomplished from a forward slip;

(2) 3 moderately banked around-pylon figure eights, variation in altitude not to exceed 200 feet;

(3) A 720° power turn in each direction in a banked attitude of more than 45°, variation in altitude not to exceed 200 feet.

(4) Climbing and gliding turns at minimum controllable speeds;

(5) Recovery from power-on and power-off stalls entered from all normally anticipated flight attitudes;

(6) [Revoked.]

Any of the maneuvers required by this section may be modified or eliminated if such action is appropriate to the characteristics of the aircraft used in the test and appropriate operation limitations are entered on the rating record.

(b) *Glider*. (1) One flight with a 180° turn and down-wind landing;

(2) Two flights with a 360° turn to the right and left, respectively, landing each time at a point beyond and within 200 feet of a designated line or point;

(3) Two flights with right and left turns in each flight.

(c) *Aircraft limitation*. When the applicant's medical certificate shows a structural defect or limitation, such additional maneuvers and tests as may be necessary to demonstrate the competency of the applicant to pilot aircraft safely shall be required. A pilot certificate issued under these circumstances may be limited to the operation of a particular aircraft or type of aircraft and to the type of operation.

[Amdt. 20-0, 10 F. R. 5060, as amended by Amdt. 20-2, 14 F. R. 2192, and Amdt. 20-3, 14 F. R. 3326]

NOTE: § 20.26 (a) (5) was amended and § 20.26 (a) (6) was revoked by Amdt. 20-3, effective Aug. 15, 1949.

COMMERCIAL PILOT RATING

§ 20.30 *Age*. 18 years.

§ 20.31 *Citizenship*. Applicant shall be a citizen of the United States or of a foreign government which grants or has undertaken to grant reciprocal commercial pilot privileges to citizens of the United States on equal terms and conditions with citizens of such foreign government.

[Amdt. 20-10, 13 F. R. 4313.]

§ 20.32 *Education*. Applicant shall be able to read, write, speak, and understand the English language.

§ 20.33 *Physical standards*—(a) *Powered aircraft*. Applicant for a powered aircraft rating shall meet the physical standards of the second class prescribed in Part 29 of this subchapter.

(b) *Glider*. Applicant shall have no known physical defect which renders him incompetent to pilot a glider, and shall so certify.

§ 20.34 *Aeronautical knowledge*—(a) *Powered aircraft*. Applicant shall pass a written examination covering such of the provisions of Parts 43 and 60 of this subchapter as are pertinent; meteorology as applied to the recognition of weather

conditions while flying, the analyzing of weather maps and sequence reports furnished by the United States Weather Bureau; practical air navigation problems including the use of maps, navigation by terrain and dead reckoning, and the use of navigational instruments and aids; the theory and practice of flight; the maintenance of aircraft and the maintenance and use of aircraft powerplants in common use.

(b) *Glider*. Applicant shall pass a written examination on such of the provisions of Parts 43 and 60 of this subchapter as are pertinent or hold a powered aircraft rating.

§ 20.35 *Aeronautical experience*—(a) *Powered aircraft*. An applicant for a commercial pilot rating shall have a total of at least 200 hours of flight time credited in accordance with Part 43 of this chapter. This total flight time shall include at least 100 hours of flight time as pilot in command, of which 5 hours shall have been flown within 60 days immediately preceding the date of application; 20 hours of cross-country flight time as pilot in command which shall include at least one flight of not less than 350 miles in the course of which 3 full-stop landings are made at different points; and 10 hours of night flight time of which 5 hours may be dual instruction time, and which shall include not less than 10 take-offs and 10 landings as pilot in command and as sole manipulator of the controls. The required 100 hours of pilot in command flight time may include the cross-country and night flight time required to be flown as pilot in command.

(1) An applicant who does not meet the above-mentioned night flight time requirements but does meet the other requirements of this section may be issued a pilot certificate with a commercial rating, and in that event the Administrator shall appropriately endorse such certificate to show that the holder thereof does not meet the night flight time requirement.¹ At such time as the holder of a certificate so endorsed submits reliable documentary evidence to the Administrator that he has met such night flight time requirement, he shall be reissued a certificate without such endorsement.

(2) Not more than 25% of the flight time flown as pilot in command may be

¹ Paragraph 2.4.1.3 (c) of Annex 1 (Personnel Licensing Standards) to the Convention on International Civil Aviation provides that an applicant for a commercial pilot certificate shall have 10 hours of night flight time as set forth in the above text. An individual holding a pilot certificate with a commercial rating who does not meet such requirement may not participate in international flight as a commercial pilot unless he receives permission from the State or States whose territory is entered. Further, pursuant to the provisions of Article 39 of the Convention on International Civil Aviation he shall have endorsed on his certificate the particulars in which he does not meet the International Standards. However, such endorsement on a commercial rating issued by the Administrator does not prohibit the holder thereof from exercising the privileges of a commercial pilot rating while flying in the United States.

had in glider aircraft provided the applicant holds a pilot certificate with a private or commercial glider rating.

(b) *Glider*. Applicant shall have had at least 250 glider flights, or 25 hours of glider flight time including at least 125 glider flights. At least 5 flights must have been made within 60 days preceding the date of application. Applicant also shall have had at least one hour of flight instruction in recovery from stalls and spins. An applicant who is the holder of a private or commercial rating for a powered aircraft and who has had not less than 100 glider flights, or 10 hours of glider flight time including at least 50 glider flights, will be deemed to have met the requirements of this section.

[Amdt. 20-8, 12 F. R. 6852, and Amdt. 20-4, 14 F. R. 3521]

§ 20.36 *Aeronautical skill*. Applicant shall competently perform the following maneuvers:

(a) *Powered aircraft*. (1) A series of 3 landings from an altitude not to exceed 1,000 feet with engine throttled and a 180° change in direction, the aircraft touching the ground in normal landing attitude beyond and within 200 feet of a designated line or point. At least one landing shall be accomplished from a forward slip;

(2) A spiral in each direction of not less than 3 full turns in a banked attitude of not less than 60°, with engine throttled;

(3) 3 shallow on-pylon figure eights, 3 steep on-pylon figure eights, and one 720° power turn in each direction in a banked attitude of at least 60°. During each of these maneuvers the total variation in altitude shall not exceed 100 feet;

(4) [Revoked.]

(5) Straight climbs, climbing turns, slips, maneuvers at minimum controllable speeds, and emergency maneuvers such as simulated forced landings and recovery from power-on and power-off stalls entered from all normally anticipated flight attitudes.

(b) *Glider*. (1) One flight with a 180° turn and down-wind landing;

(2) Two flights with a 360° turn to right and left, respectively, landing each time beyond and within 100 feet of a designated line or point;

(3) Two flights with right and left turns in each flight.

[Amdt. 20-0, 10 F. R. 5060, as amended by Amdt. 20-3, 14 F. R. 3326]

NOTE: § 20.36 (a) (4) was revoked and 20.36 (a) (5) was amended by Amdt. 20-3, effective Aug. 15, 1949.

AIRCRAFT, FLIGHT INSTRUCTOR, AND INSTRUMENT RATINGS

§ 20.40 *Aircraft rating competence*. (a) An applicant for any additional aircraft rating subsequent to the original issuance of a pilot certificate shall demonstrate competency in aircraft of the category and class and, if the aircraft has a maximum certificated take-off weight of over 12,500 lbs., of the type for which the rating is sought.

(b) A pilot limited by his rating to nonspinnable aircraft, when applying for removal of this restriction, shall have had at least 30 solo hours, and shall have had at least 3 hours of certified dual instruction in spinnable aircraft which shall include instruction in recovery from power-on and power-off stalls entered from all normally anticipated flight attitudes.

(c) A pilot limited by his rating to gliders, when applying for a pilot rating in powered aircraft, shall meet the aeronautical knowledge, experience, and skill requirements appropriate to the pilot rating sought.

[Amdt. 20-3, effective Aug. 15, 1949, 14 F. R. 3327]

§ 20.41 *Flight instructor rating for powered aircraft*—(a) *Age*. 18 years.

(b) *Knowledge*. Applicant shall pass a theoretical and practical examination on his competency to instruct students in flight.

(c) *Experience*. Applicant shall be a commercial pilot or a private pilot who meets the requirements of § 20.35 (a).

(d) *Skill*. Applicant shall demonstrate his ability to perform with precision and to teach such flight maneuvers as are necessary and appropriate for instruction in the safe piloting of aircraft.

§ 20.42 *Instrument rating*—(a) *Knowledge*. Applicant shall pass a written examination demonstrating his familiarity with the use of such instruments and other navigational aids, both in the aircraft and on the ground, as are necessary for the navigation of aircraft by instruments, with instrument flight rules, and with flight planning in relation to air traffic control services and aircraft performance. An applicant who is a private pilot shall, in addition, meet the knowledge requirements of § 20.34 (a), except those pertinent to the maintenance of aircraft and aircraft engines.

(b) *Experience*. An applicant shall hold a private or commercial pilot rating and shall have at least:

(1) 150 hours of flight time as pilot in command, of which not less than 50 hours shall be cross-country flight time; and

(2) 40 hours of instrument time under actual or simulated instrument flight conditions, of which not less than 20 hours shall have been in actual flight.

(c) *Aeronautical skill*. Applicant shall competently perform the following maneuvers solely by reference to instruments:

(1) Straight and level flight,
(2) Moderately banked 180° and 360° turns in both directions,

(3) Straight and level flight at minimum safe speeds, minimum glides, maximum climbs, and approaches to stalled attitudes of flight,

(4) Climbing turns,
(5) Stalls, skids, slips, spirals, banks in excess of 45°, and recovery from unusual positions,

(6) A demonstration of estimating arrival time, taking into account speed, wind, and drift.

(d) *Radio skill*. Applicant shall demonstrate his competence while flying

solely by reference to instruments with respect to the following items:

- (1) Tuning radio,
- (2) Orientation,
- (3) Operation along a radio range leg,
- (4) Locating cone of silence,
- (5) Let-down using approved instrument approach procedure for the particular airport.

(e) *Modified tests*. Any of the maneuvers or procedures required in paragraphs (c) and (d) of this section may be modified or eliminated if such action is appropriate to the characteristics of the aircraft or equipment used in the test and appropriate operation limitations are noted.

[Amdt. 20-0, 10 F. R. 5060, as amended by Amdt. 20-2, 14 F. R. 2192]

CERTIFICATION RULES

§ 20.50 *Application*. Application for a student pilot certificate, pilot certificate, or any rating shall be made on a form furnished by the Administrator.

§ 20.51 *Duration*. (a) A student pilot certificate shall expire 24 calendar months after the month of issuance.

(b) A pilot certificate with a private or commercial rating shall remain in effect unless it is suspended, or revoked, or a general termination date for such certificate is fixed by the Board.

[Amdt. 20-7, 12 F. R. 5008]

§ 20.52 *Temporary certificates*. The Administrator or his authorized representative may issue a temporary student pilot certificate or a temporary pilot certificate with a private or commercial rating for a period of not to exceed 90 days, subject to the terms and conditions specified therein by the Administrator.

[Amdt. 20-7, 12 F. R. 5008]

§ 20.53 *Surrender*. Any pilot shall, upon request, deliver his certificate or rating to the Administrator, if it has been suspended or revoked.

§ 20.54 *Exchange of certificates*. (a) A private or commercial pilot certificate which was effective on or after January 1, 1942, and which was issued prior to July 1, 1945, will expire on July 1, 1947. Such certificate may be exchanged at any time prior to July 1, 1947, for a pilot certificate and the appropriate ratings provided for in this part.

(b) *Reissuance*. Any person who on June 30, 1947, held a valid private or commercial certificate and who failed to exchange such certificate in accordance with paragraph (a) of this section, may, notwithstanding such failure and without other showing, obtain a pilot certificate with appropriate ratings upon application to the Administrator.

[Amdt. 20-4, 12 F. R. 40, as amended by Amdt. 20-6, 12 F. R. 5007]

§ 20.55 *Military competence*. Certificates granted on the basis of military competence shall be issued under the conditions specified in this section.

(a) *Private pilot rating*. An applicant for a pilot certificate with a private pilot rating on the basis of military competence shall be deemed to have met the aeronautical knowledge, experience, and skill requirements of this subchapter

for the issuance of such certificate, if he passes a written examination on Parts 43 and 60 of this subchapter and presents reliable documentary evidence showing:

(1) That he is a member of the armed forces of the United States or a civilian employee of the ferry or transport services of such forces, and is on solo flying status as a rated pilot or the equivalent, or

(2) That he has been honorably discharged or released from such forces and has had at least 10 hours of solo flying in military aircraft within the preceding 12 calendar months.

(b) *Commercial pilot rating*. An applicant for a pilot certificate with a commercial pilot rating on the basis of military competence shall be deemed to have met the aeronautical knowledge, experience, and skill requirements of this subchapter for the issuance of such certificate, if he passes a written examination on Parts 43 and 60 of this subchapter and presents reliable documentary evidence showing:

(1) That he is a member of the armed forces of the United States or a civilian employee of the ferry or transport services of such forces and that he has been on active duty on solo flying status as a rated pilot or the equivalent for a period of at least 6 consecutive months immediately preceding application, or

(2) That he has been honorably discharged or released from such forces and had been on active duty of the type specified in subparagraph (1) of this paragraph for a period of at least 6 consecutive months within 18 months immediately preceding application.

(c) *Aircraft category, class, and type ratings based on military competence*. An applicant for a particular rating, who holds a pilot certificate issued on the basis of military competency or otherwise, shall be issued appropriate aircraft category, class, and type ratings upon the presentation of reliable documentary evidence that he has within the preceding 12 months had at least 10 hours of flight time in military aircraft during which he was first pilot or the sole manipulator of the controls of an aircraft of the category, class, and type for which a rating is sought.

(d) *Instrument rating*. An instrument rating will be issued to an applicant who holds a currently effective military instrument rating if the requirements for the issuance of such a rating and the privileges authorized by it are not less than those of this subchapter with respect to such rating.

[Amdt. 20-9, 13 F. R. 2790, as amended by Amdt. 20-2, 14 F. R. 2192]

EXAMINATIONS AND TESTS

§ 20.60 *General*. The prescribed examinations and tests shall be given by a person designated by the Administrator.

§ 20.61 *Physical examination*. Prior to taking a flight test for a rating, an applicant shall have met the appropriate physical requirements within the time limitations hereinafter prescribed:

(a) *Private rating*. Within the preceding 24 months.

(b) *Commercial rating.* Within the preceding 12 months.

[Amdt. 20-1, 14 F. R. 109]

§ 20.62 *Aircraft used in flight tests—*
(a) *Powered aircraft.* Applicant shall furnish a certificated aircraft which must be equipped with complete dual controls and accommodate the applicant and examiner and parachutes for both. In addition, aircraft used for instrument flight tests shall be equipped as specified in § 43.30 (c).

(b) *Glider.* Applicant shall furnish a certificated glider.

§ 20.63 *Time and place.* All examinations and tests will be held at such times and places as the Administrator may designate.

§ 20.64 *Reapplication after failure.* Applicants who have failed in any examination will be subject to the following rules in making application for reexamination:

(a) An applicant for a pilot certificate with a powered aircraft rating or for an additional rating who fails to pass any prescribed theoretical examination may reapply after the expiration of 30 days from the date of such failure or after he has received not less than 5 hours of instruction from a certificated ground instructor in each subject failed.

(b) An applicant who has failed to pass any prescribed practical examination or test on powered aircraft may reapply only after an appropriately rated flight instructor has checked his competency and certified in the applicant's logbook that he considers such applicant qualified for the certificate or rating sought, or after the expiration of 30 days from the date of such failure.

(c) An applicant for a glider rating who has failed to pass any prescribed theoretical examination may reapply at any time after the expiration of 30 days or after he has received not less than 5 hours of instruction on each subject failed from a certificated ground instructor.

(d) An applicant for a glider rating who has failed to pass any prescribed practical examination or test may reapply only after he has made at least 20 additional gliding flights.

DEFINITIONS

§ 20.70 *Definitions.* As used in this part the words listed below shall be defined as follows:

[Amdt. 20-2, 14 F. R. 2193]

§ 20.71 *Category.* Category shall indicate a classification of aircraft such as airplane, helicopter, glider, etc.

[Amdt. 20-2, 14 F. R. 2193]

§ 20.72 *Class.* Class shall indicate a difference in basic design of aircraft within a category, such as single-engine land, multi-engine sea, etc.

[Amdt. 20-2, 14 F. R. 2193]

§ 20.73 *Copilot.* Copilot shall mean a pilot serving in any piloting capacity other than as pilot in command on aircraft requiring two pilots for normal operations, but excluding a pilot who is

on board the aircraft for the sole purpose of receiving flight instruction.

[Amdt. 20-2, 14 F. R. 2193]

§ 20.74 *Dual instruction time.* Dual instruction time shall mean that portion of the flight time during which a person is receiving flight instruction from a rated flight instructor on board the aircraft.

[Amdt. 20-2, 14 F. R. 2193]

§ 20.75 *Flight instructor.* Flight instructor means a pilot who is qualified to instruct other pilots and who has received a flight instructor rating.

[Amdt. 20-2, 14 F. R. 2193]

§ 20.76 *Flight time.* Flight time shall mean the total time from the moment the aircraft first moves under its own power for the purpose of flight until the moment it comes to rest at the end of the flight.²

[Amdt. 20-2, 14 F. R. 2193]

§ 20.77 *Maximum certificated take-off weight.* Maximum certificated take-off weight shall mean the maximum take-off weight authorized by the terms of the aircraft airworthiness certificate.

[Amdt. 20-2, 14 F. R. 2193]

§ 20.78 *Night.* Night is the time between the ending of evening twilight and the beginning of morning twilight as published in the Nautical Almanac converted to local time for the locality concerned.³

[Amdt. 20-2, 14 F. R. 2193]

§ 20.79 *Pilot.* A pilot is an individual who manipulates the controls of an aircraft during the time defined as flight time.

[Amdt. 20-2, 14 F. R. 2193]

§ 20.80 *Pilot in command.* Pilot in command shall mean the pilot responsible for the operation and safety of the aircraft during the time defined as flight time.

[Amdt. 20-2, 14 F. R. 2193]

§ 20.81 *Solo flight time.* Solo flight time shall mean the flight time during which a pilot is the sole occupant of an aircraft.

[Amdt. 20-2, 14 F. R. 2193]

§ 20.82 *Type.* Type shall mean all aircraft of the same basic design including all modifications thereto except those modifications which result in a change in handling or flight characteristics.

[Amdt. 20-2, 14 F. R. 2193]

²For example, a pilot taxis to the warm-up apron and holds there for several minutes before taking off to permit the engine to warm up. Such taxi and warm-up time is not considered flight time. Flight time begins when the aircraft leaves the warm-up apron and ends when the pilot returns to the parking apron and turns the switches off.

³The Nautical Almanac containing the ending of evening twilight and the beginning of morning twilight tables may be obtained from the Superintendent of Documents, Government Printing Office, Washington 25, D. C. Information is also available concerning such tables in the offices of the Civil Aeronautics Administration or the United States Weather Bureau.

PART 21—AIR-LINE TRANSPORT PILOT RATING

Sec.

21.1 Provision for issuance.

MINIMUM REQUIREMENTS

21.9 Eligibility.
21.10 Age.
21.11 Character.
21.12 Citizenship.
21.13 Education.
21.14 Physical condition.
21.15 Aeronautical knowledge.
21.16 Aeronautical experience.
21.17 Aeronautical skill.
21.18 Radio skill.
21.20 Existing aircraft ratings.

AIR-LINE TRANSPORT PILOT COMPETENCY CERTIFICATE

21.21 Application.
21.22 Issuance.
21.23 Display.
21.24 Duration.
21.25 Nontransferability.
21.26 Operation during physical deficiency.
21.27 Surrender.
21.28 Reexamination.

EXAMINATIONS AND TESTS

21.30 General.
21.31 Physical examination.
21.32 Time and place.
21.33 Aircraft used in tests.
21.34 Aircraft category rating.
21.35 Airplane class and horsepower rating.
21.36 Inspection.
21.37 Standard of performance.
21.38 Reports.

PILOT REGULATIONS

21.40 Certificated air-line transport pilots.
21.41 Passenger carrying.
21.42 Recent experience requirements.
21.43 Instruction.
21.44 Logbooks.

DEFINITIONS

21.50 Definitions.
21.51 Category.
21.52 Class.
21.53 Flight time.
21.54 Maximum certificated take-off weight.
21.55 Night.
21.56 Pilot in command.
21.57 Solo flight time.
21.58 Type.

AUTHORITY: §§ 21.1 to 21.58 issued under sec. 205 (a), 52 Stat. 984; 49 U. S. C. 425 (a). Interpret or apply secs. 601, 602, 52 Stat. 1007, 1008; 49 U. S. C. 551, 552.

SOURCE: §§ 21.1 to 21.58 contained in Civil Air Regulations, May 31, 1938, amended by Amendment 75, 5 F. R. 3946, except as noted following sections affected.

§ 21.1 *Provision for issuance.* Pursuant to the provisions of the Civil Aeronautics Act of 1938, as amended, empowering the Administrator of Civil Aeronautics to issue airman certificates specifying the capacity in which the holders thereof are authorized to serve as airmen in connection with aircraft, and requiring the Civil Aeronautics Board to prescribe such reasonable rules and regulations governing practices, methods, and procedures as the Board may find necessary to provide adequately for safety in air commerce, air-line transport pilots will be rated as to competence in accordance with the provisions of the following regulations.

[Reg. 601-A-1, 3 F. R. 2053, as amended by Amdt. 75, 5 F. R. 3946]

MINIMUM REQUIREMENTS

§ 21.9 *Eligibility.* To be eligible for an airline transport pilot competency

rating, an applicant shall comply with the minimum requirements set forth in §§ 21.10-21.18.

§ 21.10 *Age.* Applicant shall be at least 23 years of age.

§ 21.11 *Character.* Applicant shall be of good moral character.

§ 21.12 *Citizenship.* Applicant shall be a citizen of the United States or of a foreign government which grants or has undertaken to grant reciprocal air-line transport pilot privileges to citizens of the United States on equal terms and conditions with citizens of such foreign government.

[Amdt. 21-5, 13 F. R. 4313]

§ 21.13 *Education.* (a) Applicant shall be able to read, write, and understand the English language, and shall be able to speak the English language without accent or impediment of speech which would interfere with two-way radio conversation; and

(b) Shall be a high school graduate or what is deemed by the Administrator to be its equivalent from the applicant's showing of general experience and aeronautical experience, knowledge, and skill.

§ 21.14 *Physical condition.* Applicant shall meet the physical standards of the First Class prescribed in Part 29 of this subchapter.

[Amdt. 21-6 7 F. R. 3923]

§ 21.15 *Aeronautical knowledge.* Applicant shall be familiar with and shall accomplish a satisfactory written examination on:

(a) The provisions of Parts 1, 21, 27, 40, 60, 61, and 98 of this subchapter, together with such parts of the provisions of Part 4a of this subchapter as are pertinent to the operations of air carrier aircraft.

(b) The fundamentals of air navigation and the use of formulas and of instruments and other navigational aids, both in aircraft and on the ground, which are deemed necessary for the navigation of aircraft by instruments.

(c) The general system of weather collection and dissemination.

(d) Weather map, weather forecast, and weather sequence abbreviations, symbols, and nomenclature.

(e) Elementary meteorology, including modern knowledge of the cyclons as associated with fronts.

(f) Cloud forms.

(g) Department of Agriculture Weather Bureau Circular N, Instructions for Airway Meteorological Service, and all amendments thereto.

(h) Weather conditions, including icing conditions and upper-air winds, affecting aeronautical activities.

(i) Air navigation facilities in use on the civil airways, including rotating beacons, course lights, radio ranges, and radio marker beacons.

(j) Data obtained from airplane weather observations and meteorological data reported from observations made by pilots engaged in air carrier flights.

(k) The influence of terrain upon meteorological conditions and develop-

ments, and the relation thereof to air carrier flight operations.

(l) Radio communication procedure as applied to aircraft operation.

(m) The basic principles of loading and weight distribution and its effect on flight characteristics.

[CAR, May 31, 1938, as amended by Amdt. 81, 5 F. R. 4530, and Amdt. 21-6, 14 F. R. 2194]

§ 21.16 *Aeronautical experience.* An applicant for an airline transport pilot rating shall hold a valid commercial pilot rating, or equivalent as determined by the Administrator, and shall have had at least 1,200 hours of flight time as pilot within the last 8 years, of which

(a) 5 hours shall have been had within 60 days immediately preceding the date of application;

(b) 500 hours shall have been cross-country flight time;

(c) 100 hours shall have been night flight time;

(d) 75 hours shall have been instrument time under actual or simulated instrument conditions of which not less than 50 hours shall have been in actual flight; and

(e) 250 hours of the preceding requirements shall have been as pilot in command, of which 100 hours shall have been cross-country flight time and at least 25 hours shall have been night flight time.

[Amdt. 21-6, 14 F. R. 2194]

§ 21.17 *Aeronautical skill.* (a) Applicant shall demonstrate satisfactorily his ability to pilot aircraft in normal take-offs, turns, landings, and the following maneuvers (the maneuvers in subparagraphs (6) and (7) of this paragraph shall be performed in an aircraft satisfactory to the examining inspector of the Administrator):

(1) From 3,500 feet, with engine throttled, a 360° turn and a landing in normal landing attitude.

(2) From 2,500 feet, with engine throttled, a 180° turn and a landing in normal landing attitude.

(3) A series of three shallow and three steep figure 8 turns and one 720° steep power turn in each direction. During these maneuvers, the pilot shall not gain or lose more than 200 feet of altitude.

(4) A spiral in one direction from 3,500 feet, or higher, with engine throttled, and a landing in normal landing attitude.

(5) Subparagraphs (1) through (4) of this paragraph shall be applicable when the flight tests are conducted in aircraft of a gross weight in excess of 10,000 pounds; otherwise the pilot shall be required to demonstrate his aeronautical skill in accordance with § 20.26 of this subchapter.

(6) Emergency maneuvers such as simulated forced landings, spirals, side slips and climbing turns, and recovery from stalls, maneuvers in multiengine equipment with authorized load with one engine inoperative, if rating is sought on such equipment, and such other maneuvers as the examining inspector of the Administrator may deem necessary to demonstrate the competence of the applicant.

(7) A right-hand and a left-hand spin, each of at least two full turns, with not to exceed 10 degrees error.

NOTE: The requirements of subparagraphs (1)-(7) of this paragraph and of § 21.18 (b) may be met by the holding of a valid commercial rating.

(b) Applicant shall accomplish satisfactorily a flight test, solely by instruments, with respect to the following:

(1) Straight level flight for a given period of time.

(2) Moderate banks during 180° and 360° turns in both directions.

(3) Minimum glides and maximum climbs, and approaches to stalled attitudes of flight.

(4) Climbing turns.

(5) Stalls, skids, slips and spirals, and banks in excess of 45°, and recovery from the same.

NOTE: The requirements of subparagraphs (1)-(5) of this paragraph may be met by the holding of a valid instrument rating.

(6) Such other maneuvers as the examining inspector deems necessary.

(7) A practical demonstration, while in flight or under simulated conditions, of estimating arrival time, taking into account speed, wind, and drift.

[CAR, May 31, 1938, as amended by Amdt. 101, 6 F. R. 1159, Amdt. 115, 6 F. R. 2871 and Amdt. 21-6, 14 F. R. 2194]

§ 21.18 *Radio skill.* (a) An applicant shall demonstrate his ability to interpret International Morse Code signals, and shall accomplish a satisfactory flight test in a hooded cockpit with respect to the following:

(1) Tuning radio.

(2) Orientation. Effective January 1, 1939, such orientation shall include the use of the radio direction finder with sufficient tests to determine the ability of the pilot to:

(i) Home on a radio station.

(ii) Determine whether the aircraft is heading toward or away from the station.

(iii) Obtain accurate fixes by the use of radio compass.

(3) Following radio range.

(4) Locating cone of silence.

(5) Letting-down-through on the range by the approved instrument approach procedure for the particular airport used in connection with the test.

(6) Such other maneuvers as the examining inspector deems necessary.

(b) Such maneuvers as are necessary to demonstrate competence to satisfactorily pilot an aircraft from either control seat. None of the maneuvers provided for in §§ 21.17 and 21.18 shall be disregarded, but any such maneuver may be modified by the examining inspector of the Administrator to such extent as may be necessary for reasonable and safe operation of the aircraft used in the particular maneuver. Such inspector will report any such modification to the Administrator in writing.

[CAR, May 31, 1938, as amended by Amdt. 21-6, 14 F. R. 2194]

AIR-LINE TRANSPORT PILOT COMPETENCY CERTIFICATE

§ 21.20 *Existing aircraft ratings.* Every pilot having an airline transport

pilot rating with appropriate aircraft category and class, and horsepower ratings, issued by the Administrator prior to May 1, 1949, may continue to operate aircraft in accordance with the limitations of such rating until the expiration, suspension, revocation, or surrender of the rating: *Provided*, That after May 1, 1953, each such pilot shall comply with § 21.35 (b).¹

(a) *Aircraft rating.* The aircraft which the applicant is deemed competent to pilot shall be prescribed in his certificate by category and class, and type if the aircraft has a maximum certificated take-off weight of 12,500 lbs. or more and, in the case of unconventional airplanes, such description as is appropriate to define clearly the competence of the applicant. Competence to pilot aircraft shall be demonstrated in aircraft of the category and class and, if appropriate, the type for which the rating is sought.

[Amdt. 21-6, 14 F. R. 2194]

§ 21.21 *Application.* Application for an air-line transport pilot certificate shall be made to the Administrator upon a form supplied for the purpose.

(a) *Application to amend.* When any change in an air-line transport pilot competency rating is desired, the applicant shall file a written request therefor with the Administrator upon a form supplied for the purpose.

(b) *Revocation.* No person whose air-line transport pilot certificate has been revoked shall apply for or be issued a pilot certificate of any grade or rating for a period of 1 year after the revocation, except as the order of revocation may otherwise provide.

[CAR, May 31, 1938, as amended by Reg. 601-A-1, 3 F. R. 2052, Amdt. 19, 4 F. R. 3391, and Amdt. 87, 5 F. R. 5256]

§ 21.22 *Issuance.* Upon approval of an application duly made, proofs submitted and examinations and tests satisfactorily completed, an air-line transport pilot certificate will be issued in an appropriate form.

(a) *Temporary certificate.* Following application made for an air-line transport pilot certificate, but prior to approval thereof and issuance of the certificate, a temporary air-line transport pilot certificate may be issued by the examining inspector of the Administrator.

(b) *Special ratings.* A special rating, except an instrument rating, will be issued to and renewed for the holder of a valid air-line transport pilot certificate pursuant to the provisions of §§ 20.40-20.42, and upon the same terms as such rating is issued to and renewed for the holder of a valid commercial pilot certificate.

¹Annex 1 to the Convention on International Civil Aviation (Personnel Licensing Standards) requires a pilot to have a type rating for all aircraft of a maximum certificated take-off weight of over 12,500 pounds. However, by the terms of the Convention, a holder of a pilot certificate issued prior to May 1, 1949, may, until May 1, 1953, exercise all of the privileges of such certificate both in the United States and internationally without compliance with such international standard.

(c) *Instruction in air transportation service.* Any person holding a valid airline transport pilot rating shall be considered competent to instruct other pilots in air transportation service in aircraft of a category, class, and type specified in the airline transport pilot rating of the instructing pilot. No pilot shall give more than 8 hours of such instruction in any one day nor more than 36 hours in any 7-day period. Such instruction shall be given only in aircraft equipped with fully functioning dual controls.

[CAR, May 31, 1938, as amended by Reg. 601-A-1, 3 F. R. 2052, Amdt. 115, 6 F. R. 2872, Amdt. 21-9, 7 F. R. 6632, and Amdt. 21-6, 14 F. R. 2194]

§ 21.23 *Display.* An air-line transport pilot certificate shall be kept in the personal possession of the pilot at all times when piloting aircraft, and shall be presented for inspection upon the demand of any passenger, or of any authorized official or employee of the Administrator or Board or any State or municipal official charged with the duty of enforcing local laws or regulations involving Federal compliance, or upon the reasonable request of any other person.

[CAR, May 31, 1938, as amended by Reg. 601-A-1, 3 F. R. 2052, Amdt. 75, 5 F. R. 3946]

§ 21.24 *Duration.* An air-line transport pilot certificate shall be of 60 days' duration and, unless the holder thereof is otherwise notified by the Administrator within such period, it shall continue in effect thereafter, until otherwise specified by the Board, unless suspended or revoked.

[Amdt. 21-7, 7 F. R. 5037]

§ 21.25 *Nontransferability.* An air-line pilot certificate is not transferable.

§ 21.26 *Operation during physical deficiency.* A certificated air-line transport pilot shall not operate any aircraft during the period of any known physical deficiency or increase in physical deficiency which would render him during that period unable to meet the physical requirements with which he complied in order to secure his certificate.

[Amdt. 75, 5 F. R. 3946]

§ 21.27 *Surrender.* Upon the suspension, revocation, or expiration of an air-line transport pilot certificate, the holder of such certificate shall, upon request, surrender such certificate to any officer or employee of the Administrator.

[Amdt. 75, 5 F. R. 3946]

§ 21.28 *Reexamination.* (a) An applicant who has failed any prescribed theoretical examination may apply for reexamination at any time after the expiration of 30 days from the date of such failure or after he has received not less than 5 hours instruction in each subject failed from a person employed by an airline to instruct in such subject or from whichever one of the following persons is appropriate:

- (1) A certificated air-line transport pilot;
- (2) A certificated ground instructor rated for the subject;

(3) A person qualified to instruct in the theory of instrument flight.

(b) An applicant who has failed to pass any prescribed practical examination or test may apply for reexamination only after (1) he has logged at least 5 additional hours of flying solely by instruments and at least 5 additional hours of dual flight instruction with a certificated flight instructor or a certificated air-line transport pilot, or (2) he has acquired such part of the above practice or instruction as may, in the opinion of the Administrator, warrant reexamination. Upon meeting the requirements of this paragraph an applicant for reexamination shall be deemed to meet the 5 hours solo flight time requirements set forth in § 21.16 (b).

(c) Applicant shall present a statement from the instructor indicating that he has given the required instruction and that he deems the applicant qualified to pass the flight test or that part of the theoretical examination in which such instruction was given, whichever is appropriate.

[Amdt. 21-10, 7 F. R. 8414]

EXAMINATIONS AND TESTS

§ 21.30 *General.* The examinations and tests prescribed in the regulations of this part (both for an air-line transport pilot certificate and for the ratings issued with respect thereto) will be conducted by an authorized officer or employee of the Administrator or by a properly qualified person designated for the purpose by the Administrator. During the flight tests the air carrier may have a check pilot on board.

[CAR, May 31, 1938, as amended by Reg. 601-A-1, 3 F. R. 2055]

§ 21.31 *Physical examination.* In connection with the original issuance of any air-line transport pilot certificate the physical examination prescribed shall be accomplished by a medical examiner of the Administrator of Civil Aeronautics, duly authorized to so examine such pilots, before any practical or theoretical test or other examination will be given, and shall be completed within the 6 months preceding the date of filing application for such pilot certificate.

[CAR, May 31, 1938, as amended by Reg. 601-A-1, 3 F. R. 2052, and Amdt. 21-6, 7 F. R. 3923]

§ 21.32 *Time and place.* All examinations and tests will be held at such times and places as the Administrator may designate.

§ 21.33 *Aircraft used in tests.* The applicant shall furnish a certificated aircraft for any flight test involved. Each such aircraft, used in any test for an air-line transport pilot certificate shall be equipped with dual controls and shall accommodate the applicant and the inspector. Aircraft having only one elevator and aileron control for two seats, or any arrangement whereby all flight and engine controls cannot be handled in a normal or conventional manner from either seat, are not considered as having dual controls for the purpose of flight tests for pilot ratings. Each such air-

craft shall have adequate vision for the pilot and check pilot.

[CAR, May 31, 1938, as amended by Reg. 601-A-1, 3 F. R. 2052]

§ 21.34 *Aircraft category rating.* For purposes of specifying the category of aircraft which the applicant is deemed competent to pilot and for convenience in examining and rating the applicant with respect thereto, aircraft are categorized as follows:

- (a) Airplane;
- (b) Autogiro;
- (c) Glider;
- (d) Lighter-than-air aircraft.

[Amdt. 115, 6 F. R. 2872, as amended by Amdt. 21-6, 14 F. R. 2194]

§ 21.35 *Airplane class and type rating—(a) Airplane class rating.* For purposes of specifying the class of airplane which the applicant is deemed competent to pilot and for convenience in examining and rating the applicant with respect thereto, airplanes are classed as follows:

- (1) Single-engine, land;
- (2) Single-engine, sea;
- (3) Multiengine, land;
- (4) Multiengine, sea;
- (5) Unconventional.

(b) *Type rating.* An aircraft type rating shall be issued for each type of aircraft having a maximum certificated take-off weight of over 12,500 lbs.

[Amdt. 115, 6 F. R. 2872, as amended by Amdt. 21-6, 14 F. R. 2194]

§ 21.36 *Inspection.* The applicant for an air-line transport pilot certificate shall offer full cooperation in respect of any inspection or examination which may be made of said applicant upon proper demand by any authorized representative of the Administrator prior or subsequent to the issuance of such certificate.

[CAR, May 31, 1938, as amended by Reg. 601-A-1, 3 F. R. 2052]

§ 21.37 *Standard of performance.* Every practical and theoretical examination and test shall be accomplished to the satisfaction of the Administrator and the minimum passing grade in the subject of examination or test shall be 70 percent. Each flight maneuver will be graded separately. Other examinations will be graded as a whole.

§ 21.38 *Reports.* The person giving any examination or test in behalf of the Administrator will report the result thereof upon an appropriate form to the Administrator and all data collected incident to such examination or test will be considered as of a confidential nature by such person and by all employees of the Civil Aeronautics Authority.

PILOT REGULATIONS

§ 21.40 *Certificated air-line transport pilots—(a) Rating limitations.* No certificated air-line transport pilot shall operate any aircraft other than in accordance with the rating limitations set forth in his pilot certificate: *Provided*, That the holder of a valid air-line transport pilot certificate may pilot airplanes:

- (1) As a second pilot without an airplane class and horsepower rating for the particular airplane operated;

(2) As a first pilot of a class or within a horsepower range other than that specified in his air-line transport pilot certificate, but he shall not carry any person in such airplanes other than members of the crew thereof, certificated airmen carried in air carrier airplanes in furtherance of their official duties, or a certificated instructor rated for the airplane operated.

(b) *Periodic physical examinations.* A certificated air-line transport pilot shall not pilot an aircraft in operations for which he is required to possess an air-line transport pilot rating unless, within the preceding 6 calendar months, he has met the physical requirements of this part by passing an examination given by an authorized air-line medical examiner of the Administrator.

(c) *Medical certificate.* A medical certificate issued by an authorized air-line medical examiner of the Administrator or other evidence satisfactory to the Administrator that the pilot has met the physical requirements of this part shall be carried by such pilot while piloting aircraft.

[Amdt. 115, 6 F. R. 2872, Amdt. 21-6, 7 F. R. 3923, and Amdt. 21-4, 12 F. R. 3170]

§ 21.41 *Passenger carrying.* A certificated air-line transport pilot shall not pilot any aircraft carrying any person other than members of the crew thereof, certificated airmen carried in air carrier aircraft in furtherance of their official duties, or a certificated instructor rated for the aircraft operated, unless, within the 90 days immediately preceding, he shall have made at least 3 take-offs, and 3 landings to a full stop, in an aircraft of the same category (§ 21.34) and if an airplane, within the same class (§ 21.35 (a)) as that of the aircraft in which any such person is carried.

[Amdt. 115, 6 F. R. 2872, as amended by Amdt. 21-6, 14 F. R. 2194]

§ 21.42 *Recent experience requirements—(a) Passenger flight (day and night).* A certificated airline transport pilot shall not pilot an aircraft carrying any person other than the members of the crew thereof, certificated airmen carried in air carrier aircraft in furtherance of their official duties, or a certificated instructor rated for the aircraft operated, unless within the preceding 3 calendar months he shall have made and logged at least 3 take-offs and landings to a full stop in an aircraft of the same category, class, and type as that of the aircraft in which such person is carried. A certificated airline transport pilot shall not pilot such aircraft between sunset and sunrise unless he has made at least one of the 3 required take-offs and landings between sunset and sunrise.

(b) *Instrument flight.* A certificated airline transport pilot, who within the preceding 6 calendar months has not flown and logged at least 2 hours of flight time solely by reference to instruments under either actual or properly simulated instrument flight conditions, shall not pilot an aircraft under such conditions until he has flown and logged at least 2 hours of such flight time accompanied by a certificated pilot of at least private

grade holding an appropriate category, class, and type rating for the aircraft and authorized to operate aircraft under instrument conditions.

[Amdt. 27-7, 7 F. R. 5037, as amended by Amdt. 21-6, 14 F. R. 2194]

§ 21.43 *Instruction.* No person holding a valid air-line transport pilot certificate shall give flying instruction, except as provided for in § 21.22 (c), unless possessed of a valid instructor rating.

[CAR, May 31, 1938, as amended by Reg. 601-A-1, 3 F. R. 2052 and Amdt. 21-9, 7 F. R. 6632]

§ 21.44 *Logbooks.* The following rules will govern pilot logbooks:

(a) *General.* Every certificated air-line transport pilot shall keep an accurate record of his flying time in a logbook in which the entries as to solo flying time have been certified to by him and the entries as to instruction have been certified to by his instructor. Logbooks shall be bound records and the entries shall be accurate, legible, in ink or indelible pencil, and so arranged as to facilitate easy reference thereto.

(b) *Contents.* The logbook shall contain the date of flight, the category, class, and type of aircraft flown, the aircraft certificate number, a statement of pilot in command, dual instruction, instrument and night flight time, the duration of the flight, the points between which such flight was made, and, in addition, when any flight results in serious damage to the aircraft, a notation to this effect. Dual instruction time shall be logged in the same manner and, in addition, the instructor shall make complete entries in the logbook of his student showing the nature of each maneuver in which instruction was given and the time spent thereon. The instructor shall attest each such entry with his initials, pilot certificate number, and pertinent rating. This logbook shall be presented for inspection, upon demand and reasonable notice, to any authorized representative of the Administrator or Board or State or municipal officer enforcing local regulations or laws involving Federal compliance.

(c) *Logging of pilot flight time.* The holder of an airline transport pilot certificate may log the total flight time while acting as pilot in command or copilot.

(d) *Logging instrument flight time.* Instrument flight time may be logged as such only when the aircraft is flown solely by reference to instruments either under actual or properly simulated flight conditions. (Over-the-top flying shall not be logged as instrument flight time.)

(e) *Reports.* The holder of an air-line transport pilot certificate shall furnish the authorized air-line medical examiner of the Administrator, at the time of each physical examination to be forwarded by him to the Administrator, a report setting forth the amount and type of his aeronautical experience and such other pertinent data as the Administrator may require since his last preceding report.

[CAR, May 31, 1938, as amended by Amdt. 115, 6 F. R. 2872, Amdt. 21-4, 7 F. R. 740, Amdt. 21-7, 7 F. R. 5033, and Amdt. 21-6, 14 F. R. 2194]

RULES AND REGULATIONS

DEFINITIONS

§ 21.50 *Definitions.* As used in this part the words listed below shall be defined as follows:

[Amdt. 21-6, 14 F. R. 2194]

§ 21.51 *Category.* Category shall indicate a classification of aircraft such as airplane, helicopter, glider, etc.

[Amdt. 21-6, 14 F. R. 2194]

§ 21.52 *Class.* Class shall indicate a difference in basic design of aircraft within a category, such as single-engine land, multi-engine sea, etc.

[Amdt. 21-6, 14 F. R. 2194]

§ 21.53 *Flight time.* Flight time shall mean the total time from the moment the aircraft first moves under its own power for the purpose of flight until the moment it comes to rest at the end of the flight (block to block).

[Amdt. 21-6, 14 F. R. 2194]

§ 21.54 *Maximum certificated take-off weight.* The maximum certificated take-off weight shall mean the maximum take-off weight authorized by the terms of the aircraft airworthiness certificate.

[Amdt. 21-6, 14 F. R. 2194]

§ 21.55 *Night.* Night is the time between the ending of evening twilight and the beginning of morning twilight as published in the Nautical Almanac converted to local time for the locality concerned.²

[Amdt. 21-6, 14 F. R. 2194]

§ 21.56 *Pilot in command.* Pilot in command shall mean the pilot responsible for the operation and safety of the aircraft during the time defined as flight time.

[Amdt. 21-6, 14 F. R. 2194]

§ 21.57 *Solo flight time.* Solo flight time shall mean the flight time during which a pilot is the sole occupant of an aircraft.

[Amdt. 21-6, 14 F. R. 2194]

§ 21.58 *Type.* Type shall mean all aircraft of the same basic design including all modifications thereto except those modifications which result in a change in handling or flight characteristics.

[Amdt. 21-6, 14 F. R. 2195]

PART 22—LIGHTER-THAN-AIR PILOT CERTIFICATES

CLASSIFICATION OF LIGHTER-THAN-AIR PILOT CERTIFICATES

Sec.

22.1 Grades.

LIGHTER-THAN-AIR PILOT CERTIFICATE REQUIREMENTS

22.10 Student lighter-than-air pilot certificate.

22.11 Private lighter-than-air pilot certificate.

²The Nautical Almanac containing the ending of evening twilight and the beginning of morning twilight tables may be obtained from the Superintendent of Documents, Government Printing Office, Washington 25, D. C. Information concerning such tables is also available in the offices of the Civil Aeronautics Administration or the U. S. Weather Bureau.

Sec.

22.12 Commercial lighter-than-air pilot certificate.

22.13 Free balloon pilot certificate.

LIGHTER-THAN-AIR PILOT CERTIFICATES

22.20 Application.

22.21 Duration.

22.22 Recent experience requirements.

22.23 Reinstatement.

22.24 Examinations and tests.

PILOT REGULATIONS

22.31 Flight limitations and privileges.

22.32 Miscellaneous.

DEFINITIONS

22.40 Lighter-than-air aircraft.

22.41 Solo flight time.

22.42 Dual instruction.

AUTHORITY: §§ 22.1 to 22.42, issued under sec. 205 (a), 52 Stat. 984; 49 U. S. C. 425 (a). Interpret or apply secs. 601, 602, 52 Stat. 1007, 1008, 49 U. S. C. 551, 552.

SOURCE: §§ 22.1 to 22.42 contained in Amendment 127, 6 F. R. 4558, except as noted following sections affected.

CLASSIFICATION OF LIGHTER-THAN-AIR PILOT CERTIFICATES

§ 22.1 *Grades.* Lighter-than-air pilot certificates are classified in the following grades:

(a) Student lighter-than-air pilot certificate.

(b) Private lighter-than-air pilot certificate.

(c) Commercial lighter-than-air pilot certificate.

(d) Free balloon pilot certificate.

LIGHTER-THAN-AIR PILOT CERTIFICATE REQUIREMENTS

§ 22.10 *Student lighter-than-air pilot certificate.* To be eligible for a student lighter-than-air pilot certificate an applicant shall comply with the following requirements:

(a) *Age.* Applicant shall be at least 16 years of age. If applicant be less than 21 years of age at the time of making application, he shall submit with his application the written consent of either parent, or legal or natural guardian to the issuance of the pilot certificate sought.

(b) *Character.* Applicant shall not be temperamentally unsuited for flying.

(c) *Citizenship.* Applicant shall be:

(1) A citizen of and of unquestionable loyalty to the United States, or

(2) A person who is in sympathy with the objectives of the United States and who is a trustworthy citizen of a friendly foreign government not under the domination of or associated with any government with which the United States is at war.

(d) *Education.* If an applicant is unable to read, speak, and understand the English language, appropriate operation limitations may be entered upon his student lighter-than-air pilot certificate.

(e) *Physical condition.* Applicant shall meet the physical standards of the Third Class prescribed in Part 29 of this subchapter.

(f) *Aeronautical knowledge.* No requirement is prescribed.

(g) *Aeronautical experience.* No requirement is prescribed.

(h) *Aeronautical skill.* No requirement is prescribed.

[Amdt. 127, 6 F. R. 4558 as amended by Amdt. 22-1, 22-2, 22-3, 7 F. R. 989 and Amdt. 22-5, 7 F. R. 3924]

§ 22.11 *Private lighter-than-air pilot certificate.* To be eligible for a private lighter-than-air pilot certificate an applicant shall comply with the following requirements:

(a) *Age.* Applicant shall be at least 18 years of age. If applicant be less than 21 years of age at the time of making application, he shall submit with his application the written consent of either parent, or legal or natural guardian to the issuance of the pilot certificate sought.

(b) *Character.* Same as in § 22.10 (b).

(c) *Citizenship.* Same as in § 22.10 (c).

(d) *Education.* Applicant shall be able to read, speak, and understand the English language.

(e) *Physical condition.* Applicant shall meet the physical standards of the Third Class prescribed in Part 29 of this subchapter.

(f) *Aeronautical knowledge.* Applicant shall pass a written examination covering so much of the provisions of this part and Parts 1 and 60 of this subchapter as are pertinent to his certificate, prevailing weather conditions in the United States as encountered in flying, and the forecasting thereof, the analyzing of weather maps and sequence reports as furnished by the United States Weather Bureau, practical air navigation problems and the use of maps, navigation by terrain (pilotage) and by dead reckoning, including the use of instruments and other aids to navigation in visual-contact flying, and the general servicing and operation of airships.

(g) *Aeronautical experience.* Applicant shall have logged at least 50 flight hours actually at the controls of airships, including not less than 5 hours of solo flight and not less than 5 hours of cross-country flight. At least 5 hours of such time shall have been logged within the 60 days immediately preceding the date of filing the application.

(h) *Aeronautical skill.* Applicant shall satisfactorily demonstrate his ability to pilot airships in solo flight and in addition to normal take-offs and landings to perform satisfactorily the following maneuvers:

(1) A series of right and left turns and figure eights;

(2) Ascents and descents at rates up to 600 feet per minute not permitting gas pressure to exceed 1½ inches of water during ascents or to fall below 1 inch of water during descents;

(3) Land the airship 200 pounds heavy and 200 pounds light;

(4) Such other maneuvers as the Administrator deems necessary.

(i) *Military competence.* An applicant for a private lighter-than-air pilot certificate on the basis of military competence shall be deemed to have met the aeronautical knowledge, experience, and skill requirements of the Civil Air Regulations for the issuance of such certificate, if he passes a written examination on Parts 43 and 60 of this subchapter and presents reliable documentary evidence showing:

(1) That he is a member of the armed forces of the United States or a civilian employee of the ferry or transport services of such forces, and is on solo flying status as a rated lighter-than-air pilot or the equivalent, or

(2) That he has been honorably discharged or released from such forces and has had at least 10 hours as sole manipulator of the controls of a military lighter-than-air aircraft within the preceding 12 months.

[Amdt. 127, 6 F. R. 4558, as amended by Amdt. 22-5, 7 F. R. 3924, and Amdt. 22-3, 13 F. R. 2791]

§ 22.12 *Commercial lighter-than-air pilot certificate.* To be eligible for a commercial lighter-than-air pilot certificate an applicant shall comply with the following requirements:

(a) *Age.* Applicant shall be at least 18 years of age. If applicant be less than 21 years of age at the time of making application, he shall submit with his application the written consent of either parent, or legal or natural guardian to the issuance of the pilot certificate sought.

(b) *Character.* Applicant shall not be temperamentally unsuited for flying.

(c) *Citizenship.* Applicant shall be a citizen of the United States or of a foreign government which grants or has undertaken to grant reciprocal commercial lighter-than-air pilot privileges to citizens of the United States on equal terms and conditions with citizens of such foreign government.

(d) *Education.* Applicant shall be able to read, speak, write, and understand the English language.

(e) *Physical condition.* Applicant shall meet the physical standards of the Second Class prescribed in Part 29 of this subchapter.

(f) *Aeronautical knowledge.* The same as in § 22.11 (f) and, in addition, the applicant shall pass a written examination on the theory and practice of flight, the maintenance of nonrigid airships and the maintenance and proper use of airship power units, the use of such instruments and other navigational aids, both in airships and on the ground, necessary for the navigation of airships by instrument, and meteorology as applied to weather analysis and forecast.

(g) *Aeronautical experience.* Applicant shall show a total of at least 200 hours of flight time actually at the controls of airships of which at least 5 hours shall have been logged within the 60 days immediately preceding the date of the filing of the application and including:

(1) Not less than 50 hours in solo flight;

(2) Not less than 10 hours in cross-country flight;

(3) Not less than 10 hours in flight during the hours of darkness;

(4) Not less than 20 hours of instrument instruction and practice in flight: *Provided*, That not more than 10 hours of this requirement may be instruction and practice under simulated conditions not in flight when approved by the Administrator; and

(5) In lieu of not to exceed 50 hours of the 200-hour total flight time require-

ment, applicant may show an equal or greater amount of flight time while participating as a crew member when acceptable to the Administrator.

(h) *Aeronautical skill.* Same as in § 22.11 (h) except that:

(1) In the maneuvers required by § 22.11 (h) (1) the altitude of the ship shall not vary up or down in excess of 100 feet of the assigned flight altitude.

(2) In the maneuvers required by § 22.11 (h) (2) ascents and descents at rates up to 1,200 feet per minute shall be made under the same pressure limitations.

(3) Applicant shall also demonstrate satisfactorily his ability to perform, solely by instrument, the following:

(i) Straight, level flight for given period of time;

(ii) Moderate 180- and 360-degree precision turns in both directions;

(iii) Ascents and descents at rates up to 1000 feet per minute;

(iv) Climbing and diving turns and recovery therefrom;

(v) Estimating arrival time taking into account wind, air speed, and drift while in flight or under simulated conditions;

(vi) Such other maneuvers as the Administrator deems necessary.

(i) *Radio skill.* Applicant shall demonstrate satisfactorily his ability to perform while in flight the following:

(1) Tuning radio;

(2) Orientation;

(3) Following radio range;

(4) Locating cone of silence;

(5) Letting-down-through on the range by a satisfactory airship instrument approach procedure for the particular airport used in connection with the test; and

(6) Such other maneuvers as the Administrator deems necessary.

(j) *Military competence.* An applicant for a commercial lighter-than-air pilot certificate on the basis of military competence shall be deemed to have met the aeronautical knowledge, experience, and skill requirements of the regulations in this subchapter for the issuance of such certificate, if he passes a written examination on Parts 43 and 60 of this subchapter and presents reliable documentary evidence showing:

(1) That he is a member of the armed forces of the United States and that he has been on active duty on solo flying status as a rated lighter-than-air pilot with unlimited instrument privileges for a period of at least 6 consecutive months immediately preceding application, or

(2) That he has been honorably discharged or released from such forces and had been on active duty of the type specified in subparagraph (1) of this paragraph for the period of at least 6 consecutive months within 18 months immediately preceding application.

[Amdt. 127, 6 F. R. 4558 as amended by Amdt. 22-5, 7 F. R. 3924, Amdt. 22-3, 13 F. R. 2791 and Amdt. 22-4, 13 F. R. 4313]

§ 22.13 *Free balloon pilot certificate.* To be eligible for a free balloon pilot certificate an applicant shall comply with the following requirements:

(a) *Age.* Same as § 22.11 (a).

(b) *Character.* Applicant shall not be temperamentally unsuited for flying.

(c) *Citizenship.* Same as § 22.10 (c).

(d) *Education.* Applicant shall be able to read, speak, write, and understand the English language.

(e) *Physical condition.* Same as § 22.11 (e).

(f) *Aeronautical knowledge.* Same as § 22.11 (f).

(g) *Aeronautical experience.* Applicant shall have had a minimum of 6 instruction flights in free balloons of not less than 1 hour duration each and shall have logged at least 1 hour of actual solo flight time within the 90 days immediately preceding the date of filing the application. The date of such solo flight shall be certified to by the instructor on the student lighter-than-air pilot certificate.

(h) *Aeronautical skill.* Applicant shall demonstrate satisfactorily his ability to pilot and maneuver a free balloon in actual solo flight.

[Amdt. 127, 6 F. R. 4558, as amended by Amdt. 22-1, 22-2, 22-3, 7 F. R. 989]

LIGHTER-THAN-AIR PILOT CERTIFICATES

§ 22.20 *Application.* Application for a lighter-than-air pilot certificate shall be made upon the form prescribed and furnished by the Administrator.

(a) *Revocation.* No person whose lighter-than-air pilot certificate has been revoked shall apply for or be issued a pilot certificate for a period of 1 year after the revocation except as the order of revocation may otherwise provide.

(b) *Nontransferability.* A lighter-than-air pilot certificate is not transferable.

§ 22.21 *Duration.* (a) A student lighter-than-air pilot certificate shall expire 24 calendar months after the month of issuance.

(b) A private or commercial lighter-than-air pilot certificate or free balloon pilot certificate shall remain in effect unless it is suspended, or revoked, or a general termination date for such certificate is fixed by the Board.

(c) The Administrator or his authorized representative may issue a temporary lighter-than-air pilot certificate for a period of not to exceed 90 days subject to the terms and conditions specified therein by the Administrator.

§ 22.22 *Recent experience requirements—(a) General.* (1) A student who has not piloted an airship within 90 days shall not pilot such aircraft in solo flight until he has passed a flight check given by a commercial lighter-than-air pilot and that fact has been endorsed by such pilot in the student pilot logbook.

(2) The holder of a private or commercial lighter-than-air pilot certificate shall not pilot an airship carrying passengers, unless within the preceding 90 days he has had at least 5 take-offs and landings.

(b) *Night flight.* No person shall pilot a lighter-than-air aircraft carrying passengers during the period from one hour after sunset to one hour before sunrise, unless he has made at least 5 take-offs and landings to a full stop during the hours of darkness within the preceding 90 days.

(c) *Instrument flight.* A pilot shall not pilot an airship under instrument flight rules, unless he has had at least 6 hours of instrument flight under actual or simulated instrument conditions during the preceding 6 calendar months. At least 50 percent of the above required time must have been accomplished in actual flight.

[Amdt. 22-2, 12 F. R. 1029]

§ 22.23 *Reinstatement.* A private or commercial lighter-than-air pilot certificate or a free balloon pilot certificate which was effective on or after January 1, 1942, and has expired, may be reinstated upon application to an authorized representative of the Administrator prior to February 1, 1948.

[Amdt. 22-2, 12 F. R. 1029]

§ 22.24 *Examinations and tests—(a) General procedure.* The examinations and tests prescribed in this part shall be conducted by an authorized officer or employee of the Administrator or by a properly qualified person designated for the purpose by the Administrator. All examinations and tests will be held at such times and places as the Administrator may designate.

(b) *Physical examination.* Prior to taking a flight test for a lighter-than-air pilot certificate, an applicant shall have met the appropriate physical requirements within the time limitations herein after prescribed:

(1) *Private lighter-than-air pilot certificate.* Within the preceding 24 months.

(2) *Commercial lighter-than-air pilot certificate.* Within the preceding 12 months.

(c) *Reexaminations.* (1) An applicant for a private or commercial lighter-than-air pilot certificate or for a free balloon pilot certificate who has failed to pass any prescribed theoretical examination may apply for reexamination at any time after 30 days of the day of failure or after he has received not less than 5 hours instruction on each subject of the examination failed from a certificated ground instructor rated for such subject and presents a statement from such instructor showing the amount of instruction given and stating that he deems the applicant qualified to pass the required examination in such subject.

(2) An applicant for a private or commercial lighter-than-air pilot certificate or for a free balloon pilot certificate who has failed to pass any practical examination or test may apply for reexamination only after he has logged at least 3 additional hours of flight time.

(d) *Aircraft used in tests.* The applicant shall furnish suitable certificated aircraft for any flight test required.

[Amdt. 127, 6 F. R. 4558, as amended by Amdt. 22-4, 7 F. R. 3258, Amdt. 22-5, 7 F. R. 3924, and Amdt. 22-5, 14 F. R. 110]

PILOT REGULATIONS

§ 22.31 *Flight limitations and privileges—(a) Student lighter-than-air pilot.* (1) The holder of a student lighter-than-air pilot certificate shall not operate a free balloon in solo flight until:

(i) He has demonstrated thorough familiarity with the provisions of Part 60 of this subchapter dealing with contact

flight by passing a written examination of such provisions and such fact has been certified to by his instructor on the student lighter-than-air pilot certificate;

(ii) He shall have had a minimum of six instruction flights in free balloons of not less than 1 hour duration each and such fact has been certified to by his instructor on the student pilot certificate.

(2) The holder of a student lighter-than-air pilot certificate shall not pilot an airship in solo flight until:

(i) He has demonstrated thorough familiarity with the provisions of Part 60 of this subchapter dealing with contact flight by passing a written examination of such provisions and such fact has been certified to by his instructor on the student lighter-than-air pilot certificate;

(ii) He shall have had a minimum of six instruction flights in free balloons of not less than 1 hour duration each and shall have logged at least 1 hour of actual solo flight in a free balloon and such fact shall be certified to by his instructor on the student lighter-than-air pilot certificate. If the student pilot possesses a free balloon pilot certificate such certification shall not be required;

(iii) He shall have had a minimum of 35 hours of dual instruction in airships which shall include level flight, right and left turns, landing and take-offs, and shall be deemed competent by his instructor to make such flight, which fact shall be certified to by his instructor on the student lighter-than-air pilot certificate.

(3) The holder of a student lighter-than-air pilot certificate shall not pilot any lighter-than-air aircraft carrying any person other than a certificated commercial lighter-than-air pilot, a member of the crew, or another certificated student lighter-than-air pilot whose presence in the aircraft is authorized by the instructor under whose direction the flight is being made. Such person shall not pilot any lighter-than-air aircraft for hire.

(b) *Private lighter-than-air pilot.* (1) The holder of a private lighter-than-air pilot certificate shall not pilot an airship carrying any persons or property for hire nor give any flight or instrument instruction therein.

(2) The holder of such certificate may pilot a free balloon for hire and may give flight instruction therein.

(c) *Commercial lighter-than-air pilot.* The holder of a commercial lighter-than-air pilot certificate may pilot for hire any lighter-than-air aircraft carrying passengers or property and may give either flying instruction or instrument instruction therein.

(d) *Free balloon pilot.* The holder of a free balloon pilot certificate shall not pilot any lighter-than-air aircraft except a free balloon but may pilot a free balloon for hire carrying passengers or property and give flight instruction therein.

(e) *Medical certificate and renewal.* Any person while piloting a lighter-than-air aircraft shall have on his person a medical certificate or other evidence satisfactory to the Administrator showing that he has met the physical requirements within the following time limits:

(1) Student pilot, private pilot, or free balloon pilot—24 calendar months.

(2) Commercial pilot—12 calendar months.

[Amdt. 127, 6 F. R. 4558, as amended by Amdt. 22-2, 12 F. R. 1029]

§ 22.32 *Miscellaneous—(a) Display.* The holder of any lighter-than-air pilot certificate shall keep his certificate in his personal possession at all times when piloting lighter-than-air aircraft and shall present the same for inspection upon request of any passenger, any authorized officer or employee of the Administrator or Board and of any State or municipal official charged with the duty of enforcing local laws or regulations involving Federal compliance.

(1) *Medical certificate.* A medical certificate issued by an authorized medical examiner of the Administrator or other evidence satisfactory to the Administrator that the pilot has met the appropriate physical requirements prescribed in this part shall be carried by such pilot while piloting aircraft.

(b) *Surrender.* The holder of a lighter-than-air pilot certificate shall surrender, upon request, such certificate to any officer or employee of the Administrator if it has been suspended or revoked or if it has expired.

(c) *Operation during physical deficiency.* The holder of a lighter-than-air pilot certificate shall not pilot any lighter-than-air aircraft during the period of any known physical deficiency which would render him during that period unable to meet the physical requirements with which he complied in order to secure his certificate.

(d) *Inspection.* An applicant for, or the holder of, a lighter-than-air pilot certificate shall offer full cooperation with respect to any inspection or examination which may be made of such person upon proper request by any authorized representative of the Administrator.

(e) *Simulated instrument flight.* No person shall pilot a lighter-than-air aircraft in flight under simulated instrument conditions unless a certificated lighter-than-air safety pilot shall be present at all times and have ready access to the controls and adequate vision from the aircraft.

(f) *Logbooks.* Every certificated lighter-than-air pilot and every person receiving flight instruction shall keep an accurate record of his flying time in a logbook in which the entries with respect to solo flying time shall be certified to by him and such entries respecting dual instruction shall have been certified to by the lighter-than-air pilot giving the instruction. This logbook shall be presented for inspection upon request and reasonable notice to any authorized representative of the Administrator or Board or of any State or municipal officer enforcing local regulations or laws involving Federal compliance.

(1) *Form.* Such logbook shall be a bound record and the entries shall be accurate, legible, and in ink or indelible pencil so arranged as to facilitate easy reference thereto.

(2) *Content.* The logbook shall contain entries including at least the follow-

ing: The date of flight; the make and model of the lighter-than-air aircraft flown; the aircraft identification mark; a statement classifying the type of flight (whether solo, dual instruction, instrument, or night flying time); the duration of the flight; the points between which such flight was made; and, in addition, when any flight results in serious damage to the aircraft, a notation to this effect.

(3) *Logging of flight time.* No flight time shall be logged as such unless the lighter-than-air aircraft flown is a public or certificated aircraft.

(4) *Logging of instrument flight time.* No instrument flight time shall be logged as such unless the lighter-than-air aircraft is flown solely by reference to instruments either under actual or properly simulated flight conditions. Over-the-top flying shall not be logged as instrument flight time.

[Amdt. 127, 6 F. R. 4558 as amended by Amdt. 22-5, 7 F. R. 3923]

DEFINITIONS

§ 22.40 *Lighter-than-air aircraft.* A lighter-than-air aircraft is an aircraft whose support is chiefly due to buoyancy derived from aerostatic forces.

(a) *Free balloon.* A free balloon, as used in this part, shall mean a lighter-than-air aircraft not restrained from free flight by any connection with the ground nor equipped with any power plant or propelling device, the ascent and descent of which may be controlled by releasing ballast or gas and the direction of flight of which is determined by the wind.

(b) *Airship.* An airship, as used in this part, shall mean a lighter-than-air aircraft other than a fixed or free balloon.

§ 22.41 *Solo flight time.* Solo flight time, as used in this part, shall mean flight time when the pilot is in command and actually at the controls of the lighter-than-air aircraft regardless of the presence of any other crew members in the aircraft who may act under his direction.

(a) *Actual solo flight time.* Actual solo flight time, as used in this part, shall mean flight time when the pilot is the sole occupant of the lighter-than-air aircraft.

§ 22.42 *Dual instruction.* Dual instruction, as used in this part, shall mean flight time as a student at the controls of a lighter-than-air aircraft under the immediate direction of a pilot who is in command of the aircraft and authorized to give instruction therein.

PART 24—MECHANIC CERTIFICATES

REQUIREMENTS

Sec. 24.1 Mechanic certificate requirements.

RATINGS

24.10 Mechanic ratings.

24.32 Inspection.
24.33 Standard of performance.

MECHANIC REGULATIONS

24.40 Airman rating record requirement.
24.41 Parachute packing.
24.42 Major and minor parachute repairs.
24.43 Factory mechanic rating limitations.
24.44 Recent experience requirements.
24.45 Reports.
24.46 Expired certificates; special issuance.

AUTHORITY: §§ 24.1 to 24.46 issued under sec. 205 (a), 52 Stat. 984; 49 U. S. C. 425 (a). Interpret or apply secs. 601, 602, 52 Stat. 1007, 1008; 49 U. S. C. 551, 552.

SOURCE: §§ 24.1 to 24.46 contained in Amendment 39, Civil Air Regulations, 5 F. R. 684, as amended by Amendment 75, 5 F. R. 3946, except as noted following sections affected.

REQUIREMENTS

§ 24.1 *Mechanic certificate requirements.* To be eligible for a mechanic certificate, an applicant shall comply with the following requirements:

(a) *Age.* Applicant shall be at least 18 years of age.

(b) *Character.* Applicant shall be of good moral character.

(c) *Citizenship.* Applicant shall be a citizen of the United States or of a foreign government which grants or has undertaken to grant reciprocal mechanic privileges to citizens of the United States on equal terms and conditions with citizens of such foreign government.

(d) *Education.* Applicant shall be able to read, write, speak, and understand the English language: *Provided, however,* That this requirement shall not apply to an applicant employed by an air carrier outside the United States, and that Airmen Rating Records issued to such applicants as may be unable to read, write, speak, or understand the English language shall bear the following notation: "Valid only outside the United States while employed by an air carrier".

(e) *Other requirements.* Applicant shall comply with the requirements prescribed in this part for the particular mechanic rating sought.

[Amdt. 39, 5 F. R. 684 as amended by Amdt. 73, 5 F. R. 3763, Amdt. 24-7, 7 F. R. 988, Amdt. 24-3, 13 F. R. 4314]

RATINGS

NOTE: Regulation Serial No. SR-332, 14 F. R. 3198, provides as follows:

A mechanic certificate with a propeller or aircraft appliance rating, excepting a parachute rating, may be issued by the Administrator of Civil Aeronautics to an individual who is employed and designated by either a manufacturer holding a currently effective propeller or aircraft appliance production certificate or by an applicant for, or the holder of, a repair station certificate with a propeller or aircraft appliance rating. The individual must be in direct charge of the inspection, overhaul, or repair of propellers or aircraft appliances, and his experience and employment record must indicate that he is competent to engage in such activity. The individual to whom a certificate is issued

shall exercise the privileges of his certificate only with respect to the work performed for such manufacturer or repair station and through the use of facilities provided by the manufacturer or repair station.

This regulation supersedes Special Civil Air Regulation Serial No. SR-324, as amended, and shall terminate December 31, 1949.

§ 24.10 *Mechanic ratings.* Mechanic ratings are as follows:

- (a) Aircraft mechanic rating;
- (b) Aircraft engine mechanic rating;
- (c) Factory mechanic rating.

§ 24.11 *Aircraft mechanic rating.* To be eligible for an aircraft mechanic rating, an applicant shall comply with the following requirements:

(a) *Aeronautical knowledge.* Applicant shall have theoretical and practical knowledge of aircraft structure and rigging, including the control systems, and aircraft appliances, shall know how properly to inspect, maintain, and repair the same, and shall be generally familiar with the provisions of Parts 4a, 4b and 15, and thoroughly familiar with the provisions of Part 1 dealing with aircraft airworthiness and the provisions of Parts 18 and 24 of this subchapter.

(b) *Aeronautical experience.* Applicant shall have had at least 1 year of practical experience, or what is deemed by the Administrator to be its equivalent, in the construction, inspection, maintenance, or repair of aircraft and aircraft appliances.

(c) *Aeronautical skill.* Applicant shall satisfactorily demonstrate, by means of written, oral, and practical tests, his ability with respect to the subject matters prescribed in paragraph (a) of this section.

§ 24.12 *Aircraft engine mechanic rating.* To be eligible for an aircraft engine mechanic rating, an applicant shall comply with the following requirements:

(a) *Aeronautical knowledge.* Applicant shall have theoretical and practical knowledge of aircraft power plants, propellers, and their appliances, shall know how properly to inspect, maintain, and repair the same, and shall be generally familiar with the provisions of Parts 4a, 4b, 13, and 14, and thoroughly familiar with the provisions of Part 1 dealing with aircraft airworthiness and the provisions of Parts 18 and 24 of this subchapter.

(b) *Aeronautical experience.* Applicant shall have had at least 1 year of practical experience, or what is deemed by the Administrator to be its equivalent, in the construction, inspection, maintenance, or repair of aircraft engines, propellers, and their appliances.

(c) *Aeronautical skill.* Applicant shall satisfactorily demonstrate, by means of written, oral, and practical tests, his ability with respect to the subject matters prescribed in paragraph (a) of this section.

[Amdt. 39, 5 F. R. 684, as amended by Amdt. 24-1, 8 F. R. 1303]

§ 24.13 *Factory mechanic rating.* To be eligible for a factory mechanic rating, applicant must be employed by and designated by a manufacturer holding a currently effective production certificate, as in direct charge of the inspection, maintenance, overhaul, or repair of air-

craft, aircraft engines, propellers, or instruments constructed by such manufacturer. The experience and employment record of the applicant must indicate that he is competent to engage in such activity.

[Amdt. 39, 5 F. R. 684, as amended by Amdt. 109, 6 F. R. 2560]

MECHANIC CERTIFICATE

§ 24.20 *Application.* Application for a mechanic certificate shall be made upon the applicable form prescribed and furnished by the Administrator.

(a) *Application to amend.* When any change in an Airman Rating Record¹ is desired, the applicant shall file a written request therefor upon the applicable form prescribed and furnished by the Administrator.

§ 24.21 *Display.* A mechanic certificate shall be kept readily available to the mechanic at all times when he is serving in connection with certificated aircraft, aircraft engines, propellers, appliances, or parachutes and shall be presented for inspection upon the reasonable request of any person.

§ 24.22 *Duration.* A mechanic's certificate shall be of 60 days' duration, and unless the holder is otherwise notified by the Administrator within such period, it shall continue in effect thereafter until otherwise specified by the Board, unless suspended or revoked: *Provided*, That a factory mechanic's rating shall terminate at any time that the holder thereof ceases to be employed by the manufacturer to whose products the rating is limited or whenever the facilities of such manufacturer are no longer available to or in use by the holder.

[Amdt. 24-10, 7 F. R. 5080]

§ 24.23 *Temporary certificates.* The Administrator or his authorized representative may issue a temporary mechanic certificate for a period of not to exceed 90 days, subject to the terms and conditions specified therein by the Administrator.

[Amdt. 24-2, 12 F. R. 4431]

§ 24.24 *Nontransferability.* A mechanic certificate is not transferable.

§ 24.25 *Surrender.* Upon the suspension, revocation, or expiration of a mechanic certificate, the holder thereof shall surrender such certificate, upon request, to any officer or employee of the Administrator.

§ 24.26 *Reexamination.* An applicant for a mechanic certificate or rating who has failed any prescribed practical or theoretical examination or test may apply for reexamination at any time after the expiration of 30 days from the date

¹ Under § 24.40 no certificated mechanic who is directly in charge of packing parachutes or of the inspection, maintenance, or repair of certificated aircraft, aircraft engines, or their appliances, shall engage in such service unless the appropriate Airman Rating Record is attached to his certificate. The Airman Rating Record is a sheet attached to all mechanic certificates when they are issued and will contain the mechanic rating(s) held by the certificate holder.

of such failure: *Provided*, That an applicant who has failed only the examination on the pertinent Civil Air Regulations (the regulations in this subchapter) may apply for reexamination on the Civil Air Regulations after he has received not less than 5 hours instruction on the Civil Air Regulations from a certificated ground instructor and presents a statement from such instructor showing the amount of instruction given and stating that he deems the applicant qualified to pass the required examination.

§ 24.27 *Revocation.* No person whose mechanic certificate has been revoked shall apply for or be issued a mechanic certificate of any rating for a period of 1 year after the revocation, except as the order of revocation may otherwise provide.

[Amdt. 87, 5 F. R. 5256]

EXAMINATIONS AND TESTS

§ 24.30 *General.* The examinations and tests prescribed in this part will be conducted by an authorized representative of the Administrator.

§ 24.31 *Time and place.* All examinations and tests will be held at such times and places as the Administrator or his representative may prescribe.

§ 24.32 *Inspection.* The applicant for a mechanic certificate or rating shall offer full cooperation with respect to any inspection and examination which may be made of such applicant upon proper request by any authorized representative of the Administrator prior or subsequent to the issuance of a mechanic certificate or rating.

§ 24.33 *Standard of performance.* All practical or theoretical examinations and tests shall be accomplished to the satisfaction of the Administrator, and the passing grade in each subject of examination or test shall be at least 70 percent.

MECHANIC REGULATIONS

§ 24.40 *Airman Rating Record requirement.* A certificated mechanic who is directly in charge of packing parachutes or of the inspection, maintenance, or repair of certificated aircraft, aircraft engines, or their appliances, shall not engage in such service unless there is attached to his certificate the appropriate Airman Rating Record, prescribed and issued by the Administrator. Every holder of a valid mechanic certificate, or parachute rigger certificate, in effect on May 1, 1940, may perform service pursuant to such authority without an Airman Rating Record until the expiration, suspension, or revocation of such license or certificate.

§ 24.41 *Parachute packing.* A certificated mechanic holding a currently effective parachute rigger rating shall not repack any parachute which is not in condition for safe use.

§ 24.42 *Major and minor parachute repairs.* A certificated mechanic shall not make any major parachute repairs unless, at the time of making such repairs, he is in the employ of the manufacturer of the parachute or another parachute manufacturer deemed com-

petent for the purpose by the Administrator. Unless prior approval has been obtained from the Administrator, such mechanic shall not pack or repack any parachute, or make any minor parachute repairs, such as the replacement of pack-opening rubbers, packs and pilot chutes, and the patching of holes and tears in silk, in a place other than where the following facilities for such operations are available:

- (a) A suitable table, at least 3 feet by 40 feet, with smooth surface;
- (b) A rack where parachutes can be suspended for drying and airing;
- (c) Packing tools and repair equipment suitable for the repacking and repair of the type of parachute involved;
- (d) Adequate housing facilities for the above equipment.

§ 24.43 *Factory mechanic rating limitations.* The holder of a factory mechanic rating shall be limited to the inspection, maintenance, overhaul, or repair of aircraft, aircraft engines, propellers, or instruments constructed by the manufacturer employing the holder. Such work shall be performed only for such manufacturer and through the use of facilities provided by him.

[Amdt. 109, 6 F. R. 2561]

§ 24.44 *Recent experience requirements.* The holder of a mechanic's certificate shall not exercise the privileges thereunder, unless within the preceding twenty-four calendar months he has:

- (a) Served as a mechanic under the terms of his certificate and rating for at least six months of such twenty-four-month period, or
- (b) Demonstrated to the satisfaction of the Administrator that he is able to meet the standards currently prescribed by the regulations in this subchapter for the issuance of the certificate and rating.

[Amdt. 24-10, 7 F. R. 5080]

§ 24.45 *Reports.* The holder of a mechanic's certificate shall transmit to the Administrator, annually, during the month of January, a report for the preceding twelve-month period, setting forth the amount and type of his aeronautical experience and such other pertinent data as the Administrator may require.

[Amdt. 24-10, 7 F. R. 5080]

§ 24.46 *Expired certificates; special issuance.* The holder of a mechanic's certificate which has expired during the preceding twelve months may obtain a new certificate and the same rating theretofore held immediately prior to its expiration, upon application, by demonstrating to the satisfaction of the Administrator that he is able to meet the standards currently prescribed by the regulations in this subchapter for the issuance of the certificate and rating.

[Amdt. 24-10, 7 F. R. 5080]

PART 25—PARACHUTE TECHNICIAN CERTIFICATES

CERTIFICATES AND RATINGS

AUTHORITY: §§ 25.1 to 25.46 issued under sec. 205 (a), 52 Stat. 984; 49 U. S. C. 425 (a). Interpret or apply secs. 601, 602, 52 Stat. 1007, 1008; 49 U. S. C. 551, 552.

SOURCE: §§ 25.1 to 25.46 contained in Amendment 25-0, Civil Air Regulations, 8 F. R. 1332, except as noted following sections affected.

CERTIFICATES AND RATINGS

§ 25.1 *Certification of parachute technicians.* An airman certificate may be issued by the Administrator to a person qualified in accordance with the provisions prescribed in §§ 25.6 through 25.8 to perform the duties of parachute technician.

§ 25.2 *Classification of parachute technicians.* Parachute technicians shall be classified in the following ascending grades:

- (a) Parachute rigger;
(b) Senior parachute rigger;
(c) Master of parachute maintenance.

QUALIFICATIONS FOR PARACHUTE TECHNICIAN
CERTIFICATES

§ 25.6 *Parachute rigger grade—(a) Citizenship.* Applicant shall be a citizen of the United States or of a foreign government which grants or has undertaken to grant reciprocal parachute technician privileges to citizens of the United States on equal terms and conditions with citizens of such foreign government.

(b) *Age.* Applicant shall be not less than 18 years of age.

(c) *Moral character.* Applicant shall be of good moral character.

(d) *Education.* Applicant shall be able to read, write, and understand the English language: *Provided*, That a citizen of Puerto Rico, or an applicant who

is employed by an air carrier outside the United States, need not be able to read, write, speak, or understand the English language except that a certificate issued to such an applicant shall be valid only in Puerto Rico, or only while employed by an air carrier outside of the United States, as the case may be.

(e) *Knowledge.* Applicant shall pass a written, oral, and practical examination on (1) the construction, inspection, packing, maintenance, use of, and the manufacturer's instructions with respect to at least one make and type of parachute in common commercial use, and (2) the pertinent provisions of the regulations in this subchapter and related manuals.

(f) *Experience.* Applicant shall have performed satisfactory service in the packing of at least 20 parachutes of each type for which he seeks a rating under the supervision of a properly qualified and certificated parachute technician.

(g) *Military competence.* An applicant who is or was within the 12 months preceding application a regular or reserve member of the Army, Navy, Marine Corps, or Coast Guard on active duty as a parachute technician for a period of not less than one year, upon passing the prescribed written examination on the pertinent regulations in this subchapter and presentation of a statement from the appropriate military authorities attesting to such experience, will be deemed to have met the requirements of paragraphs (e) and (f) of this section.

[Amdt. 25-0, 8 F. R. 1332 as amended by Amdt. 25-3, 11 F. R. 10419, and Amdt. 25-5, 13 F. R. 4313]

§ 25.7 *Senior parachute rigger grade.* Applicant shall comply with the provisions of § 25.6 (a) through (f) and in addition thereto he shall:

(a) Demonstrate to the satisfaction of the Administrator that he has a thorough practical and theoretical knowledge of the construction, inspection, packing, maintenance, use of, and repairs to at least 3 types of parachutes in common commercial use including the manufacturers' instructions with respect to such subject;

(b) Present proof satisfactory to the Administrator that he has served as a properly qualified and certificated parachute technician or as a mechanic with a rating as a parachute rigger for a period of at least 2 years; and

(c) Present proof satisfactory to the Administrator that he has satisfactorily serviced and packed at least 25 parachutes of each make and type for which he seeks to be rated.

§ 25.8 *Master of parachute maintenance grade.* Applicant shall comply with the provisions of § 25.6 (a) through (f) and in addition thereto he shall:

(a) Demonstrate to the satisfaction of the Administrator that he has a thorough practical and theoretical knowledge of the construction, inspection, packing, maintenance, use of, and repairs to the products of not less than 3 different manufacturers including at least 4 types of parachutes and 3 types of canopies, and the ability to properly supervise all operations in connection therewith.

(b) Present proof satisfactory to the Administrator that he has served as a certificated parachute technician for a period of at least 5 years, and that he has satisfactorily serviced and packed not less than 200 parachutes of various makes and types and not less than 25 of each type and make of parachute for which he is rated; and

(c) Present written statements satisfactory to the Administrator attesting to his character, responsibility, skill, ability, and length of service, and recommending him for a "Master of Parachute Maintenance" grade.

QUALIFICATIONS FOR RATINGS

§ 25.11 *Special ratings.* Special parachute ratings are as follows:

- (a) Parachute instructor;
(b) Parachute instructor.

§ 25.12 *Parachute jumper rating.* A special rating of parachute jumper will be entered on the Airman Rating Record of a certificated parachute technician who, after inspection and examination, is found by the Administrator to meet the requirements therefor and, if less than 21 years of age, to have obtained the written consent of either parent, or legal or natural guardian.

(a) *Knowledge.* Applicant must pass a written, oral, and practical examination demonstrating a practical and theoretical knowledge of the proper methods and procedures for making test and exhibition jumps, which shall include methods of leaving and clearing aircraft with relation to the speed and attitude thereof, emergency measures to be taken in the event of malfunction of the parachute during the opening and subsequent operation thereof, and the proper method of manipulation and control of the parachute during descent and landing.

(b) *Experience.* Applicant shall present proof satisfactory to the Administrator that he has satisfactorily accomplished at least 10 jumps without injury to himself or damage to his equipment.

(c) *Physical condition.* Applicant shall meet the physical standards of the third class prescribed in Part 29 of this subchapter.

§ 25.13 *Parachute instructor rating.* A special rating of parachute instructor will be entered on the Airman Rating Record of a certificated parachute technician who satisfactorily passes a written, oral, and practical examination demonstrating his ability to teach the processes and procedures which, in the opinion of the Administrator, are deemed necessary and appropriate for the construction, inspection, packing, maintenance, repair, and use of parachutes.

EXAMINATIONS AND TESTS

§ 25.16 *General.* All examinations and tests prescribed in §§ 25.17 through 25.19 shall be conducted at a time and place designated by the Administrator.

§ 25.17 *Standard of performance.* The passing grade of any theoretical examination shall be 70 percent. The prescribed practical examinations must be accomplished to the satisfaction of the Administrator.

§ 25.18 *Physical examination.* The appropriate physical examination prescribed for a parachute jumper rating shall be accomplished before any practical or theoretical test or examination will be given, and shall be completed within the 12 calendar months preceding such test.

§ 25.19 *Reexamination.* An applicant who has failed to:

(a) Accomplish successfully any prescribed theoretical examination may apply for reexamination at any time after the expiration of 30 days from the date of such failure; or

(b) Accomplish successfully any prescribed practical examination or test may apply for reexamination (1) after expiration of 30 days from the date of such failure, and (2) after he submits proof satisfactory to the Administrator that he has received adequate instruction by a certificated parachute technician holding a rating for the make and type of parachute on which he failed to demonstrate his ability.

ISSUANCE AND DURATION OF CERTIFICATES

§ 25.21 *General.* Application for a parachute technician certificate and rating shall be made upon the applicable form prescribed and furnished by the Administrator.

§ 25.22 *Duration.* A parachute technician certificate shall remain in effect unless it is suspended, or revoked, or until a general termination date for such certificate is fixed by the Board.

[Amdt. 25-4, 12 F. R. 4431]

§ 25.23 *Existing certificates.* Any person who, on January 21, 1943, possessed a currently effective mechanic certificate with parachute rigger rating may at any time prior to December 31, 1947, secure upon application a parachute technician certificate of:

(a) Parachute rigger grade with appropriate ratings; or

(b) A higher grade with appropriate ratings upon demonstrating to the Administrator that he is able to meet the standards currently prescribed in the regulations in this subchapter for the issuance of such grade and ratings.

[Amdt. 25-2, 11 F. R. 10419]

§ 25.24 *Temporary certificates.* The Administrator or his authorized representative may issue a temporary parachute technician certificate for a period of not to exceed 90 days, subject to the terms and conditions specified therein by the Administrator.

[Amdt. 25-4, 12 F. R. 4431]

§ 25.25 *Revocation.* No person whose parachute technician certificate has been revoked shall apply for or be issued a parachute technician certificate for a period of one year after the revocation, except as the order of revocation may otherwise provide.

REGULATIONS AND LIMITATIONS

§ 25.31 *General.* A certificated parachute technician shall not serve as such unless:

(a) He has in his possession his parachute technician certificate; and

(b) There is attached as part of his certificate the appropriate Airman Rating Record prescribed and issued by the Administrator setting forth such limitations as to type and make of parachute and such other limitations as the Administrator may prescribe.

[Amdt. 25-0, 8 F. R. 1332, as amended by Amdt. 25-1, 10 F. R. 12625]

§ 25.32 *Service limitations.* A certificated parachute technician shall not:

(a) Perform any act or serve in any manner in connection with his certificate which will adversely affect public safety;

(b) Pack any parachute which is not in condition for safe use;

(c) Serve otherwise than in accordance with the terms, limitations, and conditions of his certificate and rating record except as provided in §§ 25.32 through 25.46;

(d) Pack a parachute for use by any person other than himself; unless:

(1) Such parachute has been thoroughly dried and aired for a period of at least 12 hours for each 30 days since the time of its last packing; and

(2) Such parachute is packed in accordance with the approved method of the manufacturer and in a place where the minimum facilities prescribed in § 25.46 are available; and

(3) Within the preceding 30 days he has reviewed the manufacturer's instructions with respect to the packing of the particular type if more than 6 months have elapsed since he last packed a parachute of that make and type; and

(4) Within the preceding 30 days he has reviewed the manufacturer's instructions with respect to the packing of the particular type and has made at least 10 practice packings of that type if more than 12 months have elapsed since he last packed a parachute of the identical make and type;

(e) Make any modification, alteration, or major repair not specifically authorized in writing by the manufacturer of the parachute, or the Administrator, or make any substitution of materials or parts on any parachute, or in any way deviate from the manufacturer's approved procedures of packing any make or type of parachute.

[Amdt. 25-0, 8 F. R. 1332, as amended by Amdt. 25-1, 8 F. R. 10707]

§ 25.33 *Parachute rigger.* A parachute rigger shall not make any major repairs to parachutes unless he is under the supervision of a person deemed competent for the purpose by the Administrator.

§ 25.34 *Senior parachute rigger.* A senior parachute rigger shall not make any major repairs to parachutes except to those types for which he is rated unless he is under the supervision of a person deemed competent for the purpose by the Administrator; nor shall such repairs be made otherwise than in a manner which will restore the equipment to an airworthy condition.

§ 25.35 *Master of parachute maintenance.* A master of parachute maintenance shall not make any major re-

pairs to parachutes except in a manner which will restore the equipment to an airworthy condition.

§ 25.36 *Parachute instructor.* A certificated parachute technician with a parachute instructor rating shall not permit any student under his supervision to make a training or exhibition parachute jump unless such student has been thoroughly instructed in the proper methods of making such jumps and the instructor is satisfied that the student has the theoretical knowledge prescribed in § 25.12 (a) and has passed the physical examination prescribed in § 25.12 (c).

§ 25.37 *Logbook.*—(a) *Individual logbooks.* A certificated parachute technician shall keep a record of his parachute packing and jumping operations in a logbook, which shall be a bound record and contain accurate and legible entries in ink or indelible pencil.

(b) *Contents.* The logbook shall contain the date of packing or jumping, name and address of the owner, serial number of each parachute, its type and manufacturer, place where packed or jumped, the certificate number of the parachute technician, and a record of drop tests and repairs. Such logbook shall be presented to any authorized representative of the Administrator, or any State or municipal officer enforcing local regulations or laws involving Federal compliance, upon request and reasonable notice.

(c) *Master logbook.* A certificated parachute technician in charge of parachute maintenance operations, in which two or more certificated parachute technicians are engaged in the same parachute loft, shall be responsible for the maintenance of a master logbook which shall contain all of the information prescribed in § 25.37 (b).

§ 25.38 *Display of certificate.* A certificated parachute technician shall keep his certificate readily available when on duty and shall present it for inspection upon reasonable request by an authorized person or representative of the Administrator or Board or of any State or municipal officer enforcing local regulations or laws involving Federal compliance.

§ 25.39 *Inspection.* A applicant or holder of a parachute technician certificate upon reasonable request by any representative of the Administrator shall cooperate fully in any examination which may be made of him.

§ 25.40 *Surrender of certificate.* Upon the suspension, expiration, or revocation of any certificate, the holder shall upon request surrender such certificate to any duly authorized representatives of the Administrator.

§ 25.41 *Notice of defects.* A certificated parachute technician, upon refusal to pack any defective parachute, shall give notice thereof to the owner and forward a copy to the manufacturer of the parachute and to the Administrator. Such notice shall contain the owner's name and address, the manufacturer's name, serial number, date of manufacture, the type, material, and basic construction of the canopy, a statement con-

taining the parachute's use and history, if known, and the reasons for refusing to pack the parachute.

§ 25.42 *Seal*. Each certificated parachute technician shall have a seal press of suitable design with an individual identifying marker assigned by the Administrator. Upon repacking any parachute, he shall seal the pack release with a thread of not more than 6 pounds tensile strength, and affix his seal in such a manner that it cannot interfere in any way with the prompt and proper functioning of the parachute, and shall make certain that the parachute cannot be opened without the destruction of the seal.

[Amdt. 25-0, 8 F. R. 1332, as amended by Amdt. 25-1, 8 F. R. 10707]

§ 25.43 *Parachute record*. A certificated parachute technician shall enter on the parachute packing record of each parachute packed by him the date and place of packing, his signature, and his certificate number.

§ 25.44 *Reports*. A certificated parachute technician shall transmit to the Administrator, annually, during the month of January, a report for the preceding 12-month period, setting forth the number and type of parachutes packed and such other pertinent data as the Administrator may require.

§ 25.45 *Transfer*. A parachute technician certificate is not transferable.

§ 25.46 *Minimum facilities*. Unless prior approval has been obtained from the Administrator, a certificated parachute technician shall not pack or repack any parachute or make any minor parachute repairs in a place other than where the following facilities for such operations are available:

- (a) A suitable smooth-top table at least 3 by 40 feet in length;
- (b) A suitable compartment where parachutes may be suspended for drying and airing;
- (c) Packing tools and repair equipment suitable for the repacking and repair of the type of parachute involved; and
- (d) Adequate housing facilities for such equipment.

AUTHORITY: §§ 26.1 to 26.37 issued sec. 205 (a), 52 Stat. 984; 49 U. S. C. 425 (a). Interpret or apply secs. 601, 602, 52 Stat. 1007, 1008; 49 U. S. C. 551, 552.

SOURCE: §§ 26.1 to 26.37 contained in Amendment 26-0, Civil Air Regulations, 7 F. R. 740, except as noted following sections affected.

QUALIFICATIONS FOR CERTIFICATE

§ 26.1 *General*. To be eligible for an air-traffic control-tower operator certificate an applicant shall be:

(a) At least 21 years of age; or, if serving as a member of the military services of the United States, at least 18 years of age: *Provided*, That certificates issued to members of the military services who are less than 21 years of age shall, until the holder thereof reaches the age of 21, be valid only when the holder is serving as a member of the military services in a control tower operated by such services.

(b) A person of good moral character;

(c) Able to read, write, and understand the English language and to speak the English language without any accent or impediment of speech which would interfere with two-way radio conversation;

(d) A citizen of the United States or of a foreign government which grants or has undertaken to grant reciprocal air-traffic control-tower operator privileges to citizens of the United States on equal terms and conditions with citizens of such foreign government.

[Amdt. 26-2, 8 F. R. 8527, as amended by Amdt. 26-1, 11 F. R. 7033, and Amdt. 26-4, 13 F. R. 4314]

§ 26.2 *Physical condition*. Applicant shall meet the physical standards of the Second Class prescribed in Part 29 of this subchapter.

[Amdt. 26-3, 7 F. R. 3924]

§ 26.3 *Knowledge*. An applicant must pass an examination in the following subjects:¹

¹ Lists of source material covering the subject matter of these examinations can be obtained from any Regional Manager of the Civil Aeronautics Administration.

- (a) Air traffic rules set forth in Part 60 of this subchapter;
- (b) Airport traffic control procedures, and this part;
- (c) Airway traffic control procedures;
- (d) Radio frequencies and procedures used for airport traffic control;
- (e) Use of radio aids to air navigation;
- (f) The making of weather observations;
- (g) Pertinent rules and regulations of the Federal Communications Commission. An applicant who presents satisfactory evidence that he possesses a restricted radiotelephone operator permit or higher grade of radiotelephone operator license issued by the Federal Communications Commission will not be required to take the examination prescribed in this paragraph.

QUALIFICATIONS FOR RATINGS

§ 26.6 *Character of ratings.* The holder of an air-traffic control-tower operator certificate (hereinafter referred to as "certificate") may receive a junior or senior rating, depending upon his qualifications to perform the duties of an air-traffic control-tower operator (hereafter referred to as "operator") at a particular airport.

§ 26.7 *Qualifications for junior rating.* An applicant must pass an examination on the following subjects:

- (a) Local airport rules and characteristics of local air traffic of the airport for which the rating is sought;
- (b) Local aircraft operations and such other aircraft operations as may affect conditions at the airport for which the rating is sought;
- (c) Teletype symbols and weather sequences of the airways converging on the airport and other pertinent data regarding meteorological reports available within a circular area of a radius of 125 miles measured from the airport for which the rating is sought.
- (d) Any other subject or subjects in which the Administrator may deem an examination necessary. The applicant will be given adequate notice of the subject of the examination.

[Amdt. 26-0, 7 F. R. 740, as amended by Amdt. 26-5, 14 F. R. 2195]

§ 26.8 *Qualifications for senior rating—(a) Knowledge.* An applicant must pass an examination in the subjects required for a junior rating and, in addition, the following subjects:

- (1) Air navigation facilities within a radius of 200 miles of the airport for which the rating is sought;
- (2) Airway traffic control procedures in the area in which the airport for which the rating is sought is located;
- (3) Instrument approach and departure procedures at the airport for which the rating is sought;
- (4) Any other subject or subjects in which the Administrator may deem an examination necessary.

The applicant will be given adequate notice of the subject of the examination.

(b) *Experience.* An applicant must have performed satisfactory service:

- (1) As an operator with a senior rating for at least 6 months; or

(2) As an operator with a junior rating at the airport for which the rating is sought for the 6 months immediately preceding application; or

(3) As an air-traffic control trainee in Federal service for at least 6 months; or

(4) For 1 year of the 2 years immediately preceding application as:

(i) An operator with a junior rating at an airport other than that at which the rating is sought; or

(ii) An operator at a landing area under military or naval jurisdiction.

(c) *Other requirements.* The applicant must demonstrate his ability to supervise and manage all activities of the airport control tower or airport control station, which shall at least include the preparation of such reports as may be required from time to time by the airport manager or the Administrator.

EXAMINATIONS

§ 26.12 *General.* The prescribed examinations will be conducted by representatives of the Administrator at a designated time and place.

[Amdt. 26-1, 10 F. R. 8528]

§ 26.13 *Physical examinations.* (a) The prescribed physical requirements must be met before any practical or theoretical examination will be given and must be completed within the 12 months immediately preceding application for a certificate.

(b) In lieu of a physical examination conducted by an authorized medical examiner of the Administrator, a form acceptable to the Administrator, signed by a medical officer on duty with the Army, Navy, Marine Corps, or Coast Guard who is authorized to conduct physical examinations for flying stating that the applicant is an active member of his service and has met within the preceding 12 months the physical requirements prescribed by § 26.2.

[Amdt. 26-0, 7 F. R. 740 as amended by Amdt. 26-3, 7 F. R. 3924]

§ 26.14 *Reexamination.* An applicant who has failed to pass any examination may apply for reexamination after the expiration of 30 days from the date of his failure.

ISSUANCE AND EXPIRATION OF CERTIFICATES

§ 26.18 *Duration.* An air-traffic control-tower operator certificate will continue in effect until suspended or revoked or a termination date is set by the Board.

[Amdt. 26-1, 10 F. R. 8528]

§ 26.19 *Temporary certificates.* The Administrator or his authorized representative may issue a temporary air-traffic control-tower operator certificate for a period of not to exceed 90 days, subject to the terms and conditions specified therein by the Administrator.

[Amdt. 26-2, 12 F. R. 4432, 4713]

REGULATIONS

§ 26.25 *Rating record.* A certificated operator shall not serve as such unless there is attached to his certificate the appropriate rating record prescribed and issued by the Administrator, nor serve otherwise than in accordance with the

limitations prescribed by the Administrator in his certificate or rating record.¹

§ 26.26 *Exercise of authority.* A certificated air-traffic control-tower operator shall control traffic in accordance with the procedures and practices prescribed by the Administrator to provide for the safe, orderly, and expeditious flow of air traffic and in accordance with the following requirements:

(a) When weather conditions are equal to or better than the basic minimums prescribed for VFR flight by Part 60 of this subchapter, air traffic may be controlled by an operator with either a junior or senior rating for the airport involved: *Provided*, That where the Administrator finds the volume or character of the air traffic, the type and equipment of aircraft utilizing the airport, or the airport facilities require that an operator with a junior rating be supervised, he may require all air traffic at such airport to be controlled under the supervision of an operator with a senior rating.

(b) When weather conditions are below the basic minimums prescribed for VFR flight by Part 60 of this subchapter, air traffic shall be controlled by an operator with senior rating, and such operator shall not issue an air traffic clearance for flight without prior authorization from the appropriate air traffic control center.

(c) In an emergency an operator with a senior rating may delegate his authority to an operator with a junior rating.

[Amdt. 26-3, 13 F. R. 473]

General.

§ 26.26-1 *Definitions (CAA rules which apply to § 26.26).* The following definitions apply to §§ 26.26-2 through 26.26-104:

(a) *Agency:* The United States Air Force (AF), the United States Navy, the United States Coast Guard, or the Civil Aeronautics Administration.

(b) *Airport:* A defined area on land or water, including any buildings and installations, normally used for the take-off and landing of aircraft.

(c) *Airport traffic:* Aircraft operating on and in the vicinity of an airport and other traffic operating on the movement area.

(d) *Air route traffic control area (see Control area).*

(e) *Air route traffic control center:* A facility established by competent authority to provide adequate supervision of air traffic within a specified control area.

(f) *Air traffic:* Aircraft in operation anywhere in the airspace and on that area of an airport normally used for the movement of aircraft.

(g) *Air traffic clearance:* Authorization by air traffic control, for the purpose of preventing collision between known aircraft, for an aircraft to proceed under specified traffic conditions within a control zone or control area.

(h) *Air traffic control:* A service established by competent authority to pro-

¹The rating record is a sheet which will be attached to all certificates when they are issued and will prescribe the airports at which the holder is authorized to serve and the class of rating held.

mote the safe, orderly, and expeditious flow of air traffic.

(i) Air traffic controller: A person responsible for providing air traffic control service.

(j) Airway: A path through the navigable airspace designated by the Administrator, suitable for interstate, overseas, or foreign air commerce.

(k) Alternate airport: An airport specified in the flight plan to which a flight may proceed when a landing at the point of first intended landing becomes inadvisable.

(l) Approach control: A service established to control IFR flights arriving at, departing from, and operating in the vicinity of airports by means of direct and instantaneous communication between approach control personnel and all aircraft operating under their control.

(m) Approach sequence: Two or more aircraft awaiting an approach clearance.

(n) Arrival: An arriving aircraft.

(o) ATC: Air Traffic Control.

(p) CAA: Civil Aeronautics Administration.

(q) Center: An air route traffic control center.

(r) Clearance: An air traffic clearance.

(s) Clearance limit: The point to which an aircraft is cleared.

(t) Competent authority: A representative authorized to act for an agency.

(u) Control area: An airspace of defined dimensions, designated by the Administrator, extending upwards from an altitude of 700 feet above the surface, within which air traffic control is exercised.

(v) Control tower: A facility to provide for supervision of airport air traffic.

(w) Control zone: An airspace of defined dimensions, designated by the Administrator, extending upwards from the surface, to include one or more airports, and within which rules additional to those governing flight in control areas apply for the protection of air traffic.

(x) Cruising altitude: A constant altimeter indication, in relation to sea level, maintained during a flight or portion thereof.

(y) Departure: A departing aircraft.

(z) Expected approach time: The time at which it is expected that an arrival will be cleared to commence its approach procedure preparatory to landing.

(aa) Flight plan: Specified information filed either verbally or in writing with Air Traffic Control, relative to the intended flight of an aircraft.

(bb) Holding point: A specified location, identified by visual or other means, in the vicinity of which the position of an aircraft in flight is maintained in accordance with Air Traffic Control instructions.

(cc) ICAO: International Civil Aviation Organization.

(dd) IFR: The symbol used to designate instrument flight rules.

(ee) IFR conditions: Weather conditions below the minimum prescribed for flights under VFR.

(ff) Movement area: The part of an airport reserved for the taking off, landing, and maneuvering of aircraft.

(gg) Reporting point: A geographical location in relation to which the position of aircraft is reported.

(hh) Rescue coordination center: A center which initiates, coordinates, and terminates search and rescue within an assigned area.

(ii) Rescue control center: A unit subordinate to a safety center established to direct search and rescue activities.

(jj) Safety center: A coordinated activity consisting of an air route traffic control center and a rescue coordination center.

(kk) Separation: A specified longitudinal, vertical, or lateral separation between two or more aircraft in flight.

(ll) Separation standards: The minimum longitudinal, vertical, or lateral separation provided IFR traffic.

(mm) State: Any nation of the world (international usage).

(nn) Take-off clearance: Authorization by an airport traffic control tower for an aircraft to take off.

(oo) Tower: An airport traffic control tower.

(pp) VFR: The symbol used to designate visual flight rules.

(qq) VFR conditions: Weather conditions equal to or above the minimum prescribed for flights under VFR.

(rr) VFR traffic: Aircraft operating solely in accordance with VFR.

[Supp. 1, 14 F. R. 3327]

§ 26.26-2 *Scope (CAA rules which apply to § 26.26)*. (a) Air Traffic Control procedures contained in §§ 26.26-1 through 26.26-104 shall be uniformly applied in all air route traffic control centers and airport traffic control towers operated by the United States Air Force, United States Navy, and Civil Aeronautics Administration, and by other civil air traffic control agencies.¹

(b) Where military necessity requires a reduction in separation standards, specific request for such deviation must be obtained in writing from the competent authority. These lower standards will apply only between aircraft directly under the jurisdiction of the competent authority making such request, and shall be fully covered by operations letters issued by the center or tower concerned.

(c) Control of instrument flight rule air traffic is based on the provisions of Part 60 of this chapter. The issuance of traffic clearances by centers and towers constitutes authority for the pilot to proceed only insofar as known air traffic is concerned.

(d) The basic plan for the control of air traffic involves the establishment of air route traffic control centers at strategic locations. To expedite the movement of aircraft arriving and departing at certain airports served by airport traffic control towers established by competent authority, the control of IFR traffic as well as VFR traffic is delegated to tower personnel.

(e) Where a military agency has jurisdiction over a control area, supervision of the center or tower(s) will be deter-

¹ This includes all air traffic control tower operators certificated by the Civil Aeronautics Administration.

mined by agreement among all agencies concerned.

(f) Under certain conditions it may not be desirable to establish a control area due to limited air traffic or absence of adequate navigational facilities. In this event, a suitable control zone may be established wherein the control of traffic will be the responsibility of a tower.

[Supp. 1, 14 F. R. 3328]

§ 26.26-3 *Application of control procedures (CAA rules which apply to § 26.26)*. (a) The control of instrument flight rule air traffic shall be applied in all control areas and control zones. Control areas and control zones will be designated by the appropriate authority.

(b) For the proper coordination and control of air traffic, it will be necessary under certain conditions to establish control areas over international waters as well as territories of other states, and to place such areas under the jurisdiction of United States air route traffic control centers. The boundaries of control areas and control zones outside the continental limits of the United States will normally be designated by the appropriate authorities by mutual agreement between the states concerned under the auspices of ICAO.

[Supp. 1, 14 F. R. 3328]

§ 26.26-4 *Air traffic control service (CAA rules which apply to § 26.26)*—(a) *Objective*. The primary objective of the air traffic control service shall be to promote the safe, orderly, and expeditious movement of air traffic. This shall include:

(1) Preventing collisions between aircraft and between aircraft and obstructions on the movement area.

(2) Expediting and maintaining an orderly flow of air traffic.

(3) Assisting the person in command of an aircraft by providing such advice and information as may be useful for the safe and efficient conduct of a flight.

(4) Notifying appropriate organizations regarding aircraft known to be or believed to be in need of search and rescue aid, and assisting such organizations as required.

[Supp. 1, 14 F. R. 3328]

§ 26.26-5 *Types of service (CAA rules which apply to § 26.26)*—(a) *Area traffic control*. Area traffic control is administered from an air traffic control center and provides air traffic control service for air traffic operating within a specified control area.

(b) *Airport traffic control*. Airport traffic control is established to provide adequate supervision of all traffic on the movement area and aircraft flying in visual reference to the ground in the immediate vicinity of an airport.

(1) Airport traffic control may operate either within the boundaries of a control area or at locations not supervised by a center.

(c) *Approach control*. Approach control is a service established to provide separation of air traffic arriving at, departing from, or operating in the vicinity of an airport by means of direct and instantaneous communication between approach control personnel and all aircraft under their control.

(1) Approach control personnel are governed by clearances received from the center with regard to coordination of control.

(d) *Flight assistance service.* Flight assistance service is provided to assist persons in command of aircraft by supplying information concerning known flight conditions, and to initiate search and rescue action for aircraft overdue at point of intended landing. (See Civil Aeronautics Administration and Weather Bureau Manual, "Standard Procedures for Flight Assistance Service.")

[Supp. 1, 14 F. R. 3328]

§ 26.26-6 *Allocation of responsibility (CAA rules which apply to § 26.26)*—(a) *Towers and centers.* (1) Visual flight rules: The only separation of air traffic not operating on an IFR flight plan in weather conditions equal to or better than the VFR minimums shall be that effected by a tower.

(2) Authorizing VFR operations in the control zone below VFR conditions where no tower is located: Authorization, by air route traffic control centers, of VFR operations below VFR conditions in control zones shall be in accordance with the following:

(i) When IFR traffic conditions permit, an airport operator (or his representative) may be authorized to permit local VFR operations, such as landings and take-offs, when the weather is below the VFR condition specified in Part 60 of this chapter. The following phraseology shall be used in this connection:

"Local VFR operations in the immediate vicinity of (name of) airport are authorized until (time)." (Any special instructions, such as the maximum altitude which may be used, should be added.)

(a) The airport operator is responsible for the establishment of adequate traffic patterns for such operation.

(ii) Requests for approval of departure from or entry into a control zone shall be handled individually. In each case, standard separation (§ 26.50-21) shall be effected between such operations and all IFR traffic, as well as other operations of the same nature.

"ATC clears (aircraft identification) out of/to enter control zone (number of) miles (direction) of (airport); cruise not above (altitude) while in control zone."

(iii) Standard separation (§ 26.26-21) shall be provided between all VFR operations operating in less than VFR conditions and all IFR flights operating on a traffic clearance.

(3) Instrument flight rules: The control of IFR traffic shall be effected by centers and those towers controlling IFR traffic (approach control) as follows:

(i) The center shall clear aircraft to the holding point, including holding information and expected approach time in such clearances. The holding point shall normally be a reporting point on the approach course from which an approach to the airport will be started. Approach control shall assume control of the aircraft upon arrival of the aircraft over the holding point, provided aircraft have been released to approach control.

(ii) The center shall provide separation between all aircraft operating within a control area except that:

(a) Approach control shall maintain separation between those aircraft released to approach control upon arrival of such aircraft over the holding point and during approach to the airport.

(b) Approach control shall provide separation between departing aircraft and aircraft on an approach from the holding point.

(4) The control of more than one approach sequence may be effected by approach control provided the division of control between the center and approach control is defined in operations letters approved by competent authority and is basically consistent with the above procedures.

(5) If it is considered essential, due to the position of holding points or for other reasons, to define an area wherein the control of traffic will be effected by approach control, the boundaries of such area and the division of control between the center and approach control shall be contained in operations letters approved by competent authority.

[Supp. 1, 14 F. R. 3328]

Procedures for the control of instrument flight rule traffic.

§ 26.26-21 *Separation standards (CAA rules which apply to § 26.26)*—(a) *General.* Longitudinal, vertical, or lateral separation shall be provided all aircraft operating on IFR traffic clearances (unless the cruising altitude "at least 500 on top" has been authorized), except that a VFR restriction may be applied to climb or descent and shall be applied when longitudinal, vertical, or lateral separation is not provided during climb or descent. These standards need not be applied in a control zone if:

(1) In the opinion of the airport traffic controllers adequate separation can be provided by the tower when each aircraft is continuously visible to the tower controller; or

(2) Each aircraft is continuously visible to pilots of other aircraft concerned and the pilots thereof can maintain their own separation and so advise.

[Supp. 1, 14 F. R. 3329]

§ 26.26-22 *Longitudinal separation (CAA rules which apply to § 26.26)*—(a) *Longitudinal separation.* The longitudinal spacing of aircraft at the same altitude by a minimum distance expressed in units of time, so that after one aircraft passes over a specified position the next succeeding aircraft at the same altitude will not arrive over the same position within less than the minimum number of minutes.

(b) *Minimums.*

(1) Aircraft flying on the same or converging courses:

(i) Ten minutes if radio facilities permit frequent determination of position and speed; otherwise 15 minutes.

(ii) Five minutes if a preceding aircraft has filed an air speed at least 25 miles greater than that of a succeeding aircraft.

(2) Aircraft flying on crossing courses:

(i) Ten minutes if radio facilities permit frequent determination of position and speed; otherwise 15 minutes.

(c) *Altitude change; same-direction traffic.* When lateral separation is not provided and an aircraft will pass through the altitude of another aircraft, the following longitudinal separation shall be provided:

(1) Five minutes at the time altitude levels are crossed, and provided that such separation is authorized only when:

(i) The vertical separation at the time of commencement of change is 2,000 feet or less; and

(ii) A leading aircraft is being cleared for descent through the altitude of a following aircraft, or a following aircraft is being cleared for climb through the altitude of a leading aircraft; and

(iii) The altitude change is commenced within 10 minutes after the time the second aircraft has reported over a reporting point.

(d) *Altitude change; opposite-direction traffic.* (1) Where lateral separation is provided, longitudinal separation is not required when an aircraft is to pass through the altitude level of another aircraft.

(i) Essential traffic information shall be issued.

(ii) The aircraft changing altitude level shall be cleared to climb/descend well to the right of the course.

(2) Where lateral separation is not provided, vertical separation shall be provided for at least 10 minutes prior to and after the time the aircraft are estimated to pass, or are estimated to have passed.

(i) If reports are received that aircraft have passed each other, this minimum need not apply.

(3) Where opposite-direction traffic is regularly provided vertical separation because of inadequate radio navigation facilities or other reasons, the required procedures shall be contained in operations letters approved by competent authority.

(e) *Application.* Longitudinal separation shall be established by requiring aircraft to depart at a specified time, to lose time to arrive over a geographical location at a specified time, or to hold at a geographical location until a specified time. As an alternative procedure, or in emergencies, aircraft may be required to reverse course.

(1) Pilots in direct radio communication with each other and operating with the aid of navigation facilities which provide frequent determinations of position and speed may, with their concurrence, be requested to maintain minimum longitudinal separation between their aircraft.

[Supp. 1, 14 F. R. 3329]

§ 26.26-23 *Vertical separation (CAA rules which apply to § 26.26)*—(a) *Vertical separation.* The vertical spacing of aircraft.

(b) *Minimum.* 1,000 feet, except as provided for all operators on long transoceanic routes where a reduction in altitude separation is necessary due to the relatively few cruising altitude levels available which permit proper fuel

economy below altitudes which require continuous use of oxygen equipment.

(1) No separation is required for en route traffic operating "at least 500 feet on top" if frequent pilot reports indicate a generally unlimited ceiling on top and a flight visibility of at least 3 miles. During the hours of daylight, holding aircraft operating under these conditions will require no separation.

[Supp. 1, 14 F. R. 3329]

§ 26.26-24 *Lateral separation (CAA rules which apply to § 26.26)*—(a) *Lateral separation.* The lateral spacing of aircraft at the same altitude by requiring operation on different routes or in different geographical locations as determined by visual observation or by use of radio navigational facilities.

(b) *Minimums.* All of these types of separation must be constant or increasing:

(1) *Right-side separation.* Opposite-direction traffic flying on opposite sides of a well-defined track which can be accurately determined by radio.

(2) *Quadrant or sector separation.* Flight in different quadrants or sectors of the same radio navigation facility.

(3) *Geographical separation.* Separation positively indicated by position reports over different geographical locations as determined visually or by reference to a radio facility.

(4) *Course separation.* Where courses diverge more than 45°.

(5) *Track separation.* Where aircraft are assigned different specified tracks which can be accurately determined by radio.

(c) *Right-side separation.* Aircraft shall be considered as occupying all space from the on-course signal to the right edge of the airway. (Part 60 of this chapter requires only that a pilot remain to the right of the center line of an airway.)

(1) Where radio navigation facilities are not adequate for right-side separation, opposite-direction traffic shall be separated vertically. Right-side separation shall apply to aircraft on such courses when it has been definitely determined that the aircraft are, and will remain, on opposite sides of the same course of a specified radio facility during such time as lateral separation is required. Right-side separation should not be used in the immediate vicinity of a radio range station due to the narrowness of course signals.

(2) In emergencies, same- or opposite-direction traffic may be separated by requiring flight on opposite sides of, and well off, a well-defined track which can be accurately determined by radio.

[Supp. 1, 14 F. R. 3329]

§ 26.26-25 *Altitude assignment (CAA rules which apply to § 26.26)*—(a) *Priority.* An aircraft at an altitude shall normally have priority over other aircraft desiring that altitude. When two or more aircraft are at the same altitude, the preceding aircraft shall normally have priority.

(b) *Minimum altitudes.* A controller shall not assign or authorize en route altitudes below the established minimum IFR altitude for an on-airway route to

be flown within his control area and for entering the control area of an adjacent center. A controller shall not assign or authorize en route altitudes below the established minimum IFR altitude for a direct route (off-airway). The minimum IFR altitudes established by the Administrator shall be used. If a minimum IFR altitude for a direct route has not been established, a controller shall not assign or authorize an altitude below the minimum IFR altitude established for that portion of the route which lies within his control area or that portion of an adjacent center's control area which the flight will first enter or cross.

(c) *Application.* When an aircraft reports vacating an altitude, the vacated level may be assigned to another aircraft, except that, if severe turbulence is known to exist, the first aircraft must have reported at another level before such assignment is made.

(1) Pilots in direct communication with each other may, with their concurrence, be requested to maintain a specified vertical separation between their aircraft during descent or climb.

(d) *Cruising altitudes.* Insofar as practicable, cruising altitudes of aircraft flying to the same destination shall be assigned in a manner that will be correct for an approach sequence at destination.

(e) *On-top altitude.* "At least 500 feet on top" may be assigned for flight above a cloud, haze, smoke, or other formation if the flight visibility is at least 3 miles, provided the ceiling is generally unlimited above the formation. A known definite top must exist and the aircraft shall be advised of its reported height when this clearance is issued. Caution shall be exercised in assigning on-top altitudes to long range flights operating over areas where the height of the formation is not known.

(f) *Altitude changes.* When necessary, an aircraft may be requested to change altitude at a specified time or place.

[Supp. 1, 14 F. R. 3330]

§ 26.26-26 *Holding aircraft (CAA rules which apply to § 26.26)*—(a) *Holding aircraft.* Aircraft shall be held at a designated holding point to provide minimum separation between aircraft which are awaiting their turn to land and/or to provide longitudinal separation from other aircraft. When aircraft are held at a point en route and no expected approach clearance time is issued the holding clearance shall contain a time limit, using the phrase "Expect further clearance at (time)."

(b) *Weather below landing minimums.* When the weather is below the landing minimums of an aircraft in approach sequence, the following action may be taken:

(1) An approach clearance shall be issued to the number one aircraft in the holding sequence. If the pilot then advises he desires to hold and await improvement in the weather, such action will be approved unless the reported weather is above the minimums for other aircraft in the approach sequence.

(2) In the latter case, the approach clearance shall be canceled and the number one aircraft shall be removed from

its position in the holding sequence. The aircraft shall be cleared to an adjacent fix for further holding awaiting weather change or redispaching, or given appropriate climbing clearance to place it at the top of the approach sequence, in order that the other holding aircraft may be permitted to land. The aircraft operator (if any) shall be advised of the action taken immediately after the clearance is issued, if practicable.

(3) Approach controllers shall, before taking the action outlined in subparagraph (2) of this paragraph, coordinate the rerouting of the flight with the center in order to avoid conflict with traffic under center control.
